Skefko "S. K. F." Ball Bearing

Automatically Self-Aligning

"Ball Bearings in Woodworking Plants," on page 48 of the June 1st Canada Lumberman, gives in a very clear manner some of the advantages of Ball Bearings for power shafting.

In the case of shafting which is not properly lined up or quickly gets out of alignment, the ordinary ball bearing is little if any better than a plain bearing.

The Skefko "S.K.F." Double Ball Bearing is automatically Self Aligning and will operate as efficiently under the worst conditions as if the shafting was in proper conditions.

Put yonr plant on the most efficient basis.
Install Sketko "S. K. F." Bearings.

The perfect operation of Skefko S.K.F. Ball Bearings under conditions which would put every other bearing out of business is due to the spherically ground outer raceway of the bearing. Note how the bearing acts like a ball and socket joint.

Lumber - Lath Shingles

¶ Our two large mills are now in operation sawing the finest of Spruce and Pine Lumber, Spruce Lath and Cedar Shingles.

¶ A large assortment of dry lumber always in hand on our yards, to fill orders wanted for quick shipment.

¶ Our new and up-to-date electrically driven planing and resawing mill is now running and turning out first class work. We can fill orders for either rough or dressed lumber. Cost of dressing is saved in freight.

¶ We manufacture the "Beaver Brand" White Cedar Shingles, full count; every bundle is marked "250 shingles" and bound with iron bands; no more strings and broken bunches.

¶ Mills and yards located at Bathurst, N.B., on the beautiful Bathurst Harbor. Shipments can be made by schooner and steamer right from the Company docks to any port in the world, and also by rail to any part of Canada or the United States. Intercolonial Railway tracks and sidings in our yards, with trackage room for 50 cars on our own premises.

¶ Wire, write or 'phone your orders, and ask for our monthly stock list of lumber for sale and list showing cost of dressing.

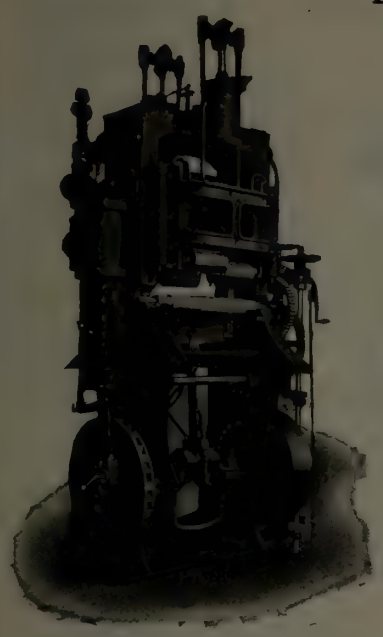
Boards

from cants and flitches, from either hard or soft woods.



ROUND LOG GANGS

JUST WHAT THE NAME IMPLIES —taking all your small logs just as they come from the pond and cutting them up into boards or dimensions, getting every board there is in the log, never over-slabbing (wish we could say this of all head sawyers.) Built to handle either one or two logs at once, up to 14 in. diameter.

KEEP THE SMALL LOGS AWAY FROM THE HEAD SAW and CARRIAGE entirely, raise your cutting capacity, and install ecomony by the same stroke.

Not an EXPERIMENT, but an ECONOMIC NECESSITY.

Think it Over Carefully, then Write us for Details.

"The Gang cannot Overslab."

Two Experienced Lumbermen

The Oxford Vulcan is a strong, broad-topped Stove particularly designed for lumber and mining camps, railroad construction camps.

You can see from this picture what a large, unobstructed top surface it has—four by two feet.

The oven dimensions are 25″ x 28″ x 16″. We also make it in a larger size 30″ x 28″ x 16″ larger than any other camp oven made.

The top is made in three sections for easy transportation with extra heavy ten-inch covers.

The reservoir capacity is exceptionally large and supplies plenty of hot water for every camp purpose.

The wood box is 28″ deep and 11″ wide, and the Simplex grates are the same construction as on our largest hotel ranges.

The Vulcan is designed for heavy outdoor work, and meets every cooking problem that arises in a camp.

You will find the Gurney-Oxford Tubular Heater in lumber and mining camps from one end of Canada to the other.

It has a large, unrestricted radiating surface, and door and inside capacity for burning the largest and roughest kind of wood.

The body is made of heavy gauge, unbreakable steel. The shelves (see illustration) are adjustable on top or on sides.

The shelves and legs can be removed and placed in inside the stove for transporting.

This is a most satisfactory and popular heater for cabins, shanties and bunkhouses.

Prices or a sample will be forwarded on application to

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale:

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.

1 Double cylinder steam nigger, right hand.

1 Log Loader for right hand mill.

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.

1 left-hand steam nigger.

1 Log-loader.

1 Endless chain jack ladder with two kickers complete for right and left hand mills.

2 Roger Gang Edgers for 8-in. cants and lumber.

1 Waterous double edger, 6 saws.

2 2-saw trimmers.

1 20-ft. Slash table.

1 16-ft. Revolving Slash Table.

1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works.

1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.

1 Lath Mill with bolter.

2 Lath Trimming Saws.

FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.

1 Automatic Grinding Machine for 8-in. S.C. band saws.

1 Automatic Machine for circular saws.

1 Hand Machine for cut-off saws.

1 Lap Grinder.

1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws.

POWER PLANT

2 Double Duplex, high pressure Water Pumps.

5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.

2 125 h.p. Water Wheels.

1 Upright Engine for sawdust conveyor.

1 10 h.p. Engine.

1 Mitts & Merrell Hog.

1 Wood Machine for 22-in. wood.

1 Wood Machine for 16-in. wood.

1 Edger for ripping dry lumber, installed.

1 Edger for ripping dry lumber, not installed.

1 30 h.p. Generator, 250 volt.

1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 34 Toronto, July 1, 1914 No. 13

Poor Drives May Reduce Sawing Season

To the many factors which have been affecting lumber trade conditions in Eastern Canada recently, there has now been added the further and very important one, that the results of the drives on many of the large rivers have not been satisfactory. In a large number of reports upon this subject, which have been received by the Canada Lumberman, it is stated that many logs are being left behind in the small streams. One feature of the situation is the fact that the past winter was a favorable one for logging, and larger quantities than usual were taken out in a good many cases, so that operating expenses were reduced to some extent. Nevertheless, if any considerable quantities of logs are to be left in the woods through the next winter—and at present there seems to be no other possible result—the effect will be of much importance, as it will involve not only a possible shortage of logs for the mills, but also a reduction of the sawing season. No one at present seems inclined to predict whether this will result in higher prices or not. Lumbermen, as a result of long and bitter experience, have gone out of the prophesying business, but it is easy to see that most of them are of the opinion that the shortage of logs, at present expected, will cause a considerable reduction in the quantity of lumber produced this year, and that prices will be higher in the near future. It may be assumed that in coming to this conclusion the wish has been father to the thought in many cases, but it seems probable also that the thought is a fairly accurate one.

An analysis of the trade situation today shows a fairly persistent demand for lumber well spread out throughout the cities and country districts, but more noticeable in the cities than elsewhere. This is acknowledged to be the case, even in the face of the long continued and quite general trade depression. It is widely believed now, that the bottom has been reached and that industry is on the up-grade, bringing a return—gradual as it may be—of confidence which will result in expansion of industrial activity and general improvement in trade conditions. This situation may be altered one way or another many times before actual trade confidence returns. Many factors may cause further delays. Wars, legislation, and political unrest of many kinds, may prevent the resumption of activity until a later period than most people expect, but the indications today are that matters are improving steadily, but surely, and that better times are not far off. If this belief is well formed it is not unreasonable to conclude that in eastern Canada, any pronounced shortage of logs will result in higher prices for lumber. That a shortage of logs is certain to develop is pretty well acknowledged now, and those who are keeping close tab on the situation are daily coming more definitely to the conclusion that the end of the coming season will see considerable improvement in trade conditions, and prices which will make up to some extent for the lack of trade which has prevailed for many months.

Canadian Crop Reports Encouraging

In a bulletin issued on June 12th by the Census and Statistics Office at Ottawa, preliminary estimates are given of the areas sown to the principal grain crops in Canada as well as reports on their condition according to returns made by crop-reporting correspondents on June 1. The reports show that, throughout the Maritime Provinces, seeding was delayed through the lateness of the spring. In Ontario and Quebec the condition of grain is generally satisfactory, notwithstanding a long spell of dry weather. In many places however, the meadows were beginning to suffer from the effects of drought. Conditions throughout the west were reported as generally favorable, though rains would be welcome, especially in Manitoba and southern Alberta.

The total area under wheat in Canada is provisionally estimated at 11,203,800 acres, or 188,800 acres more than in 1913. The area under spring wheat is reported as 10,230,500 acres, or 185,500 acres more than in 1913, and the area expected to be harvested of fall wheat is 973,300 acres or 3,300 acres more than last year. The acreage of oats is placed at 10,811,000 acres as compared with 10,434,000 acres last year, an increase of 377,000 acres. Barley occupies 1,604,000 acres, or 9,000 acres less than last year and rye 111,000 acres as compared with 119,300 acres last year. The estimated area under hay and clover is 8,206,000 acres as compared with 8,169,000 acres in 1913.

In the three Northwest provinces, Manitoba, Saskatchewan and Alberta, the total wheat area is 10,247,400 acres as compared with 10,036,000 acres in 1913; that of oats at 6,086,000 acres as compared with 5,792,000 acres in 1913; that of barley at 1,041,000 as compared with 1,025,000 acres in 1913. These differences represent increases of 211,400 acres for wheat, 294,000 acres for oats and 16,000 acres for barley; or a total increase of 521,400 acres for the three crops as compared with 1913. The wheat area in Manitoba is somewhat less than last year, viz.: 2,788,000 acres as compared with 2,804,000 acres in 1913. In Saskatchewan the area under wheat is 5,848,300 acres as compared with 5,720,000 acres, and in Alberta it is 1,611,100 acres against 1,512,000 acres.

On June 1 the condition of field crops, as measured by a standard in which 100 represents the promise of a full crop was very favorable. The points are as follows: Fall wheat 79, spring wheat 93, all wheat 91, oats and barley 92, rye 89, peas 92, mixed grains 93, hay and clover 90, alfalfa 88 and pastures 90.

Assuming that the conditions between now and harvest will be equal to the average of the past four years 1910-1913, the above percentages represent the promise of yields equal to the four year average in the case of spring wheat, rye and barley and inferior in the case of oats by 1 per cent. and in the case of fall wheat by 2 per cent.

Recent reports from Fredericton, N.B., state that forest fires broke out in several sections of New Brunswick about the middle of June. One fire was threatening serious damage to the village of Blissfield near Boisetown.

The Reader's Viewpoint on Trade Topics

Retailers Report Good Trade Conditions—Drives in Poor Shape On the Ottawa and the St. Maurice

Letters which have been received by the Canada Lumberman recently all point to a shortage in the quantity of logs which will be taken out of the Ottawa Valley during the present year. Although a good sawing season was experienced last winter, the drives during the spring and early part of the summer have not been favored with a sufficient supply of water. The result is that in many districts, a quantity of logs will be left in the woods until next driving season. One of the largest manufacturers in the Ottawa Valley, writing under date of June 15th says:—"This season has been an exceptionally bad one for saw log driving. The water has been excessively low, as a result of there having been no spring freshets whatever. We have had altogether, only a few light showers of rain during the months of April and May, and up till the middle of June. Just how many logs will be left behind in the small streams we do not know, but unless we have rain very soon there will be great difficulty in driving the large streams. It is a nice question indeed whether Ottawa mills generally will have sufficient logs to carry them through this sawing season. Some of the mills have been running from hand-to-mouth, not having more than two or three days supply ahead of them. A good rain in the near future would improve conditions greatly, but that it would insure a supply of logs for the season, we think is a matter of very great doubt.

"As to the effect upon the market, we are really not in a position to say. If this conditions prevails throughout all of Ontario and Quebec, of course there is no doubt as to the effect upon the market, but if it is only the Ottawa and its tributaries that are suffering we do not think that this would be sufficient to effect conditions seriously."

In regard to the above letter, other reports which have been received and published in the Canada Lumberman during the past month or two, indicate that similar conditions, to a greater or less extent, exist in all parts of Northern Ontario, in some parts of Quebec and also in parts of New Brunswick and Nova Scotia. It is still too early to say definitely that the shortage of logs will result in any advance of prices, but those who are in close touch with the situation are already pretty well convinced that it will at least have the effect of stiffening the market and keeping prices at least at their present level.

St. Maurice Drives Fifty Million Short

Editor Canada Lumberman: Grand Mere, P.Q., June 20th.

The winter of 1913-14, while unusually cold was characterized by a very light snowfall which did not begin until nearly the last of December, and owing to the cold, late spring, melted very slowly, with the result that, in the valley of the St. Maurice River, low water conditions prevailed. A cold, dry April and May aggravated this condition and made river driving difficult. Small creeks which are usually driven without any trouble could not be cleared, and many logs must lie over for a year. The main river has also been, and remains, very low, and only a proportion of logs which were started have as yet come down.

The saw mills at Three Rivers usually start up about the first of June, but so far, none of them have commenced work. Last season there were about 135,000,000 ft. b.m. of logs on the St. Maurice and the shortage this year will probably be about 50,000,000 ft. b.m. As the stocks on hand are light, this will mean that the supply will be much shorter than usual, and as the demand is fairly good, prices should rule considerably higher, and the wise buyer will provide for his needs as early as possible.

The paper mills on the river, knowing that conditions like the present are likely to happen, have been in the habit of holding over a supply of logs in an accessible situation and will not be affected by present shortage. The Quebec and St. Maurice Industrial Company, The Laurentide Company and the Belgo-Canadian Pulp & Paper Company all have sufficient stocks of pulpwood to carry them through the year.

The end of the present period of depression is now in sight, and before autumn, business of all kinds should begin to return to its normal state and a period of prosperity warranted by the soundness of underlying conditions begin.—Laurentide Company, Limited.

St. Maurice Driving Conditions Unfavorable

Editor Canada Lumberman: Shawinigan Falls, P.Q., June 17.

Water conditions so far have been unfavorable for driving operations in the St. Maurice Valley. I am not aware of the results in connection with other companies, but so far as our company is concerned, we are still sure of enough wood for our yearly provision, but the driving of it will cost more than we had anticipated.

I hear that driving conditions are unfavorable all over the country, but I do not think that this will affect the lumber market seriously, as there does not seem to be a very heavy demand for this year's cut.—Belgo-Canadian Pulp & Paper Company, Limited.

Editor Canada Lumberman: Three Rivers, P.Q., June 29.

We have been successful in getting all our logs out this year, although water conditions have been very unsatisfactory.—The Burrill Lumber Company.

Estate James Davidson Getting Their Logs Out

Editor Canada Lumberman:— Ottawa, June 15.

Owing to there having been such a small rain fall during the last few months, the water in the Ottawa River and its tributaries is very low at the present time and for this reason we are afraid that quite a number of the lumbermen of this Valley will be held up with their drives.

It is a little early yet to speak definitely as to whether all the drives will come out, but, so far as we are concerned, we think we will be successful in getting all our logs to our mill this season. Owing to the space in our log pond being limited, it is necessary for us to make two drives of our logs, and at the present time we have received the first drive, and are working on the second.

If the drives are held up by low water the result will be that sawmills will have to shut down early, which will no doubt make the price of lumber advance.—Estate James Davidson.

Ottawa Driving Conditions Poor

Editor Canada Lumberman:— Ottawa, June 15.

From reports that have come to hand from "Upper River" points, the driving conditions are none too good, owing to the long drought which has caused the river to fall rapidly. Lumbermen in the Ottawa Valley in general are experiencing great difficulty in bringing their logs and pulpwood to the Ottawa River itself. While I have, personally, been able to take out some of my logs and pulpwood, where the drives were short and had the advantage of early spring freshets, there are other drives in which I am interested which are now stuck, and these conditions prevail generally, I am led to understand, with the other lumbermen of the Ottawa River.—Ottawa Valley Manufacturer.

Many Ottawa Drives Having Difficulties

One of the large operators in the Ottawa Valley, in a recent letter to the Canada Lumberman, reports that the driving conditions on the Ottawa during the present year have been the worst that he has ever known. There was very little snow in the section of the country in which he operates and there had been no rain up to the middle of June. From information which he had received, he believed that this condition was general. "We have all our creek drives out into the main river, he says, "and will get our logs down to the mills, but the driving conditions could not have been much worse and we believe that, owing to the quantity of logs that will be stuck, the cut is very likely to be short."

Dennis Canadian Drives Successful

Editor Canada Lumberman:— Whitby, Ont., June 11.

In this locality there are but two drives, that of Dyment-Mickle Company to their Bellwood mill, and our own. Both these drives will reach the mills in usual time as there is plenty of lake surface behind to furnish water. There was no rainfall whatever here, all through the month of May except a slight trace on two occasions and but one shower of thirty minutes' duration so far in June.

Forest fires have been very general for the past month, and damage to standing timber as well as to other forms of property has been serious, but the fires have apparently burned themselves out and are not doing much damage now.—Dennis Canadian Company.

Many Small Drives Held Up

Editor Canada Lumberman:— Papineauville, P.Q., June 15.

We understand that quite a number of small drives have been held up in this vicinity, especially on small streams, owing to shortage of

water. The result will be a smaller supply of logs for some mills, but we do not think this will have any great effect on prices. As far as we are concerned, our logs are all on main streams and we do not anticipate any shortage. In fact, we expect a long sawing season.—Papineauville Lumber Company, Limited.

Minden Firm Doing a Prosperous Business

Editor Canada Lumberman: Minden, Ont., June 19.

Our retail business this year is as good as in an average year. We do not conduct a large retail business, but it is in a prosperous condition. The summer of 1912 was an extra good one from a business point of view, but on account of the money market being tight, we believe, that some people were kept from doing the normal amount of building in the summer of 1913. During the present season building seems to be going on very extensively. This is a rural district, but one which is growing in popularity with tourists. We supply lumber for many of their cottages. Last year, the tourists' trade was not large, possibly on account of the money stringency, but this year prospects seem to be up to the average.

We supply considerable material for government and municipal bridges, etc., and there is a normal amount of work of this kind in progress.

In our wholesale business the market seems to be a little slow. The fact that wholesalers are at present finding trade rather quiet, while some retailers are quite busy, is probably the result of many retail dealers having been well stocked last season. While they are doing a good business, they are running off considerable of their old stock before ordering now. For this reason, while the retail trade is up to the average, the wholesale trade is slow. As soon as the retailers reduce their stock a little, they will be buying again, and the wholesale trade will brighten up.—Rogers Bros.

Trade at Ottawa Good at Present

Editor Canada Lumberman: Ottawa, June 19.

Trade conditions in this vicinity, just at the present time, are quite good. There is considerable building activity, but the indications point rather to reduction than to increase, as the building permits have shown a considerable falling off in volume from those of last year.

In our judgment, this condition is due very largely to the fact that money is hard to get and that rates are high, both of which prohibit the speculative builder from engaging in his regular occupation, to a considerable extent. With loans hard to get and at a premium, the speculative builder cannot show a good return upon his investment. The general business depression, of course, affects building to a very considerable extent, as firms who are contemplating additions to their buildings, etc., are postponing construction until a more favorable period. From information which we have received, most of the retail lumbermen are not over-stocked at the present time. This, to some extent, is the cause of the fair activity in out of town orders at the present time.—The McAuliffe Davis Lumber Company, Limited.

Another Encouraging Exception

Editor Canada Lumberman: Stouffville, Ont., June 16.

In looking over the letters to the editor of the Canada Lumberman dealing with trade conditions, we notice that several correspondents are not reporting very bright business prospects for this season. This is not the case with us. We never had brighter prospects, especially in connection with shingles. We have sold as much lumber as usual, and on the whole, our business is better than that of last year. Our planing mill is running with orders ahead, and with the very best prospects for a good business this year. Prices are about the same with us as they were last season. We handle several side lines, and of course this helps to bring our sales up.

Crops are looking fine in this district, and this tends to make business better.

Wood shingles are in great demand around here now, as against metal shingles in some other districts. We find collections somewhat easier than last year at this time, and our thirty day plan is working splendidly.—D. M. Heise & Company.

Sounds Like the Good Old Times

Editor Canada Lumberman:— South Lancaster, Ont., June 12.

We were successful in getting out our drives this year and nothing was left in the river, and although we experienced some difficulty owing to the conditions of the streams, we took advantage of the floods as they came and got our drives out in record time.

We had three streams to the total of 40,000 logs and, as to the cost, it was not any greater than last year, owing to the fact that we had double the quantity of stuff.

Business conditions are very much better than last year and our turn-over will increase over 100 per cent. Our mill has been running night and all day to keep up with orders.—St. Lawrence Lumber & Box Company.

Read This and Cheer Up

Editor Canada Lumberman: Renfrew, Ont., June 18.

Business this year, up to the present month, has been better than in any previous year, and we are finding great difficulty in getting our orders filled promptly. We have on our books more orders than at any previous time in our history. Trade locally is good and buildings are being rushed by the builders in this town, and we are disposing of much more stock locally than heretofore.

On our business at Lancaster, under the name of the St. Lawrence Lumber & Box Company, we find that trade has increased 150 per cent this year and it is giving us all we can do to look after the increasing local trade and supply the demand for our outside trade. Conditions were never better than they are to-day.

We still find it difficult to get satisfactory mill help, but ordinary labor is easier to obtain than it was last year.

We have no complaint to make as to trade and see no cause for worry in the immediate future.—Chas. A. Duff.

Expecting An Early Revival

Editor Canada Lumberman: Fort William, Ont., June 15.

As far as we are able to judge, the demand for lumber this year is small compared with previous years, although there are quite a number of residences being built.

We are looking for a revival of trade in the near future. Conditions in the two cities of Fort William and Port Arthur are a little better than at points both east and west of us. It is hard to account for local depression, except by saying that we are more or less affected by the general conditions prevailing throughout the country, but we remain "optimistic."—Greer Bros. & Company.

Finds Western Demand Slow

Editor Canada Lumberman: Savanne, Ont., June 19.

We sell our lumber almost entirely in Manitoba, and therefore are not much interested in the Ontario market. We believe that the demand is very slow all over the west at present and that the same conditions obtain also in our own province. We have not been operating during the past two years and not having had any stock for sale, have not been closely interested in the market. We are sawing lumber again this year, but have not offered any for sale yet. We expect to start shipping next month.—Hogan Bros.

Substitutes Reducing Demand for Lumber

Editor Canada Lumberman: Port Perry, Ont., June 19.

On account of very high cost, lumber and its products in this vicinity are being driven out of the market to some extent by cement, metal, and patent roofings. In other respects, the trade is fair, and is made up mostly of repairing, pulling down old barns and rebuilding. New houses are very scarce, although an occasional one is going up.

I have had a larger business this year than last in both lumber and wood shingles.—C. L. Vickery.

Finds Trade Fairly Brisk

Editor Canada Lumberman: Leonard, Ont., June 16.

I find the trade in rough lumber in this district as good as in other years. I have only been handling finished stock, such as flooring and dressed sheathing for two years, but I am doing more business in the finish line this year than last year. As a whole I find that trade is fairly brisk.—R. A. Poaps.

Poor Demand At Port Sydney, Ont.

Editor Canada Lumberman: Port Sydney, Ont., June 19.

There does not seem to be the same demand for lumber this year as there was last year. I do not think that the demand in many places for renting and purchasing houses is as great as it was during the few years that have just past.—A. Sydney Smith.

A Cheerful Note

Editor Canada Lumberman: MacLennan, Ont., June 15.

I am pleased to report that trade in this district is good. I have orders on hand to keep me busy for three months ahead. Prospects were never better than at present.—John Rydall.

Hemlock Logging Across the Boundary

Description of the Development of an Important Industry in Northern Pennsylvania —Great Changes Brought About by Machinery in Logging

By H. P. Welch

The author, who is Superintendent of manufacturing and shipping for a Large Pennsylvania mill, tells interestingly of operating methods in connection with an important competitor of Ontario Hemlock. Future articles will describe logging by machinery and modern manufacturing methods.

PREVIOUS to the early seventies very little attention was given to the manufacture of hemlock lumber in Northern Pennsylvania. Up to that time (in the soft woods) white pine was used almost exclusively in this section of the state for building material which was being used in constantly increasing quantities. It is estimated that, in Tioga County alone, between the year 1804 (the year the county was organized) and the year 1865, one thousand million feet of white pine lumber was cut and marketed at an average price of seven dollars and fifty cents per thousand feet. What pine was then left was mostly owned by large and powerful companies who had received, up to the year 1885, about eighteen to twenty dollars per thousand feet. Since that time much larger prices prevailed, until today, white pine costs almost fabulous prices to those who can afford to buy it. There is very little left in Pennsylvania.

With the building of immense tanneries throughout northern and western Pennsylvania in the seventies and early eighties, there was created a demand for immence quantities of hemlock bark, which was peeled. In many instances the trunks of the trees were left on the ground to rot or be destroyed by fire.

At this time, owing to the constantly diminishing supply of pine timber and the constantly increasing price of lumber, architects and builders began making experiments with hemlock lumber and found it to give satisfactory results as to strength and fiber, and to be valuable as a building material. In many instances, on account of obtaining a pure water supply (which is necessary in the successful manufacture of leather), also to be in close proximity to the bark, tanneries were located back in the mountains, among the vast forests of hemlock timber, where hides had to be hauled long distances with teams, over mountainous roads, before finally reaching their destination, where they were to be made into leather. This left the timber usually in almost inaccessible places, where it would require miles of haulage over almost impassible roads at certain periods of the year, and in most cases costing more to get it manufactured and in the market than could be procured for it when sold. For this reason, as stated above, much was left in the woods where it was cut.

Probably nowhere in the world have grown such magnificent hemlock trees as stood in the forests situated on the watersheds of the Allegheny and Susquehanna rivers, in an altitude of from 750 to 2,500 feet. There are two distinct species of hemlock, the white hemlock, which usually grows on plateaus and dry mountainous slopes, and the red hemlock which usually grows on low wet ground. The former is found tall, sound and straight and when cut into lumber usually grades much higher than the latter.

Until the early eighties, what attention had been given to the logging of hemlock had been confined almost exclusively to timber which lay in the most accessible places for logging and for marketing. Usually, this timber was located near the larger streams which were accessible for driving or floating logs down the streams to mills situated generally at some point which connected with a trunk line of railroad to insure quick transportation of manufactured products. Most of this timber was logged or skidded to the streams by horses or oxen in the winter months, to be floated down to the mills during the spring freshets, or high water. In many cases large splash dams were built on small streams where the water was limited for driving and where there was considerable area above for the accumulation of a large body of water. Millions of feet of logs were driven out of watersheds in Northern Pennsylvania, on the crests of floods created by splash dams, to the larger streams below, that could not have been logged with profit, at that period in any other manner. In many cases above the dams where there was no water available for floating, slides or chutes were built along the mountain sides, sometimes for miles, and the logs were trailed to the water in the dams to be liberated on the first rise of water from the rains and melting snows of spring. Many sad stories might be told of the lives that were lost by drowning in the floods, or by being crushed out by the jams of logs that were liberated on lifting the gates and releasing the waters of these immense reservoirs.

At this time there were also many small portable mills scattered over this section of the country, cutting up the logs that were being cut from clearing small parcels of land by farmers who thought the land, cleared for farming purposes of much more value than the timber. The price of stumpage at this time was just about what the bark was worth, and the logs usually brought from 25 cents to 50 cents per thousand feet stripped of the bark in the woods, when a purchaser could be found. It might be added that the price of hemlock lumber was about the price of stumpage plus the cost of manufacture. In the year 1888 the writer bought strictly clear hemlock boards at the mill for a price of six dollars per thousand feet, and log run grades for somewhat less.

The price of hemlock lumber, with slight variations, from 1880 to 1904 was from $7.00 to $14.00 per thousand feet. From 1904 to 1911 it went from $14 to the highest base price of $22 per thousand feet. Since that time there has been but little change.

The average yield or cut per acre of hemlock logs in Pennsylvania, was approximately 15,000 feet and the logs would average in most cases about 6 or 7 to the thousand.

1.—Logs being delivered to slide

2.—Opening a large splash dam

3.—Many miles below the Dam—bringing up the drive

4.—Log loader filling the flat cars

During this period, the demand for hemlock lumber steadily increased, until the timber in the most accessible places was worked up. There still stood immense quantities of the finest hemlock in the northern part of the state, situated on high steep rocky ground that seemed almost impossible to lumber with profit by any of the methods previously used, and lumbermen began to study methods and means for logging on a more economical basis. This was brought about by the invention of the steam log loader and the mountain climbing locomotive. From this time on, the future success of the business was assured and those who had secured timber lands previous to this time on the lower market values laid the foundation for some of the largest fortunes ever made in this section of the state.

The illustrations accompanying this article give an excellent idea of the methods of operation in use in hemlock logging in Northern Pennsylvania to-day.

No. 1 portrays a logging scene on blockhouse creek, in Lycoming County, Pa., and shows the upper end of a slide, where logs are being delivered to it. Millions of feet of logs were delivered to the splash dams through this slide and eventually found their way to the booms at Williamsport, Pa., on the west branch of the Susquehanna River.

No. 2 gives an idea of what a large splash looks like when the waters are liberated and logs started on their last journey to the mills. This is a scene on Little Pine Creek, Watershed of Susquehanna River.

No. 3 shows the operations many miles below the dam where the men are bringing up the drive.

No. 4 shows a log loader at work on Frozen Run, Lycoming Co., Pa., headwaters of Lycoming Creek, on the Watershed of the Susquehanna River. The logs are delivered to the mill by rail.

No. 5 shows a landing at the foot of a slide. The log loader is at work loading logs on cars to be transported to the mills by rail.

No. 6 shows logs in the pond at the concrete mill of the Central Pennsylvania Lumber Company at Sheffield, Pa. This was the first electrically driven concrete mill ever built and marked a step far in advance in the improved methods of manufacturing lumber up to that time. It is still probably the finest mill in the state.

Preservative for Warping Lines

Editor Canada Lumberman: Coe Hill, Ont., June 12.

Can you advise me of a good preparation for putting upon a warping line, to prevent it from rotting when not in use?—L. Purdy.

West, Peachey & Sons, manufacturers of steam warping tugs, Simcoe, Ont., report that wire manufacturers recommend special preparations of graphite grease, both for lubrication when in use, and for preventing rust when not in use.

A good mixture to prevent rusting when not in use is, three parts of linseed oil to one part of pine tar, thoroughly mixed and put on warm.

For hemp or manilla rope, raw linseed oil will serve the purpose. A cheap grade of oil is good enough for either wire or hemp. It should be applied with a brush or swab or in any way so long as the line is well covered.

The man who hunts around among the lumber mills to find what will fit in with his work best usually finds something worth while, but the man simply hunting for bargains seldom gets more for his money.

National Hardwood Annual Convention

President Barnaby Defends 1913 Rules Against Attacks by Furniture Federation—E. V. Babcock the New President—Members Splendidly Entertained

President C. H. Barnaby

The 17th annual convention of the National Hardwood Lumber Association was held at Buffalo, N.Y., on June 18th and 19th and was far and away the most successful convention that the Association has ever held. The attendance was very large and all the business meetings were attended by a large percentage of those who were present. Entertainment features of a very successful nature were mixed with the business features of the convention in such a manner that those who attented were able to enjoy themselves very thoroughly during their short stay in Buffalo.

On the first day of the convention, the most interesting event was the annual address of the president, Mr. Chas. H. Barnaby. Mr. Barnaby's remarks dealt extensively with the action of the furniture manufacturers in their enedavor to discredit the 1913 inspection rules of the Association. He discussed this situation minutely, pointing out the absurdity of many of the misrepresentations made by the furniture men, which he branded as false and malicious. He expressed also the firm determination of the Association to follow along the lines which had already been laid down and to maintain its rights. At the same time he put particular emphasis upon the fact that the National Hardwood Lumber Association had no disagreement with the great body of lumber consumers, pointing out that the opposition upon the part of the furniture manufacturers had arisen through a number of well-meaning consumers being misled by a few dissatisfied members of the trade.

A noticeable feature of the convention was the fact that a very creditable showing was made by Canadian members, many of whom were present and followed closely all the proceedings of the various sessions.

Interesting addresses of welcome were delivered by Mr. J. P. Sullivan, president of the Buffalo Board of Aldermen, and Mr. A. W. Kreinheder, president of the Buffalo Lumber Exchange, while a fitting reply was delivered by Mr. John M. Woods, Somerville, Mass.

President Barnaby's Address

After the addresses of welcome and the reply, the Association settled down to its practical business programme which was opened by the address of the president. After a few opening remarks the president stated that the Association had made excellent progress during the year and in the face of adverse business conditions had shown an increase in membership to the extent of 35. Considering that the Association is now seventeen years of age this was an excellent showing because, approximately 12 to 15 per cent of the membership went out of the lumber business annually, so that it was necessary to add about 100 new members every fiscal year in order to prevent an actual loss.

Dealing with business conditions during the year which has passed, Mr. Barnaby said: "While we must concede that the demand for lumber is far from normal, I believe there exist excellent reasons for taking an optimistic view of the future. The depression is no more than would naturally follow a marked change in administrative policies and as far as your chairman has observed, stocks in the hands of consumers are very low and the hand-to-mouth policy of buying is the present attitude of a majority of them—so naturally, when business does resume we may all expect a splendid demand. In the meantime, it may be wise to reflect the attitude of our Government along the lines of 'watchful waiting.'"

Referring to the work of the Association during the past year, the president said that the Inspection Department showed a total of 161,000,000 feet inspected by the salaried and fee inspectors of the Association. He believed that this represented over 95 per cent of the hardwood lumber officially inspected during the year. They had reinspected 1,711,000 feet, of which 1,291,000 feet was within the 4 per cent variation, permitted by the rules, leaving 420,000 feet over the 4 per cent. This was a splendid showing in the face of the unusual business conditions prevailing during the year and was a creditable indication of the efficiency of the Association's inspectors.

Dealing with the opposition which has recently developed among furniture and fixture manufacturers in connection with the inspection rules of the Association, Mr. Branaby outlined the situation, showing that the trouble had been originated by a former member of the National Hardwood Lumber Association, who, though a consumer of hardwood lumber also possessed connections with the manufacture of lumber sufficient to entitle him to membership. Not long ago he had resigned, and for good and sufficient reasons, his resignation had been promptly accepted. He however, and another disgruntled consuming member of the National Association had directed their efforts towards making further trouble and had influenced various consuming organizations to discredit and render ineffective the existing rules of inspection. In order to do this, a resolution had been adopted by the furniture and fixture manufacturers, denouncing the existing rules and declaring adherence to the rules of 1912.

Secretary Frank F. Fish

Mr. Barnaby characterized this course as one, the wisdom of which was seriously open to question. The Association since its inception had consistently stood for single and universal standard inspection. In doing so, it had, in a broad sense, served the interests of the consumer, at the same time as those of its members. The standard which it had developed had not only enabled the lumbermen to determine beyond question the grade of lumber they were selling, but it had also enabled the consumer to know with equal certainty the grade of lumber he was buying. The Association was not at war with, or antagonistic to, any line of trade. The 1913 rules of the Association had been unanimously adopted by the largest number of its members ever assembled at a meeting. The apparent contest now existing was not between the Association and the consuming trade as a whole, because that trade was not entirely unaware of the benefits conferred by the Association. The contest was rather the result of agitation on the part of a certain small element of the consuming trade and it was dictated wholly by selfish interests. Therefore, every member of the Association should now stand firmly behind it and refuse absolutely to be forced of cajolled into yielding upon a principle in order to effect a sale. National inspection could only be employed in the application of the rules now in effect.

The opposition to the rules of the Association had resulted in a general federation of furniture and fixture manufacturers representing fourteen regional associations, which had been formed at a meeting in Chicago on May 14th. The immediate efforts of this association had been directed to the substitution of the 1912 rules for those of 1913. The 1912 rules were to be used only until a special committee had drawn up and perfected a set of inspection rules of their own.

The issue, therefore, was fairly joined between the new federation and the National Hardwood Lumber Association. The new federation would only purchase under the 1912 rules until they could form rules of their own. If they were successful, the National Hardwood Lumber Association would have no voice in the inspection and measurement of hardwood lumber so far as this consuming body was concerned. Could any hardwood lumberman imagine the state of affairs that would exist under these circumstances?

Mr. Barnaby dealt in considerable detail with the further development of this situation and the address which had been made at the Chicago meeting of the furniture and fixture manufacturers, also with a number of unfair statements which had there been made. One of these statements was to the effect that, although the furniture manufacturers had requested an opportunity to be heard by the Association, no such opportunity had been afforded. Mr. Barnaby quoted from correspondence to show that the proposal for such a meeting had been welcomed by the National Hardwood Lumber Association, but

that the furniture manufacturers had failed to take advantage of the offer to hold such a meeting.

In conclusion Mr. Barnaby asserted that the hostility developed by the furniture manufacturers was the result of some consumers being unable, any longer, to continue the unfair methods which they had practiced in the past in connection with the inspection of lumber. The hostility was not the result of the slight alterations in the rules which had been made at the 1913 meeting. Those who had misled the consumers had done so through a selfish motive, and, unfortunately, had been able to persuade the rest of the furniture and fixture federation that the National Hardwood Lumber Association was not playing the game fairly.

There was not a consumer of lumber in the country, Mr. Barnaby declared, who did not owe a debt of gratitude to the National Hardwood Lumber Association for the work which it had accomplished. It had at all times been the genuine exponent of fair treatment to all. Any attempt now, or at any other time to destroy its efficiency could only result in failure and bring into disrepute those who were most active in the work of opposition.

What was to be done under the existing conditions of affairs? Simply, let every member protect the integrity of the Association, but at the same time, set about patiently and intelligently to correct the error that had been so widely disseminated among the consuming trade. If this were done in the proper spirit no man need lose a customer or sacrifice a principle. To do more than this at the present time would intensify a bad situation; to do less would be to lose something, the value of which could not be measured in dollars and cents.

Mr. Barnaby's remarks upon this situation were received with unanimous approval by the members of the Association at the convention and it was clearly evident that all present would follow his suggestion in regard to overcoming the opposition which had developed.

The Secretary's Address

The report of the secretary, Mr. Frank F. Fish, was the next event upon the programme. It showed that the Association was in excellent condition in every respect. Mr. Fish stated that the past year had been the most successful the Association had ever experienced, not because of gain in membership or increase in the amount of lumber inspected, but because the past twelve months had been of a nature to test to the uttermost the benefits resulting from associated effort, and in every instance the Association had responded satisfactorily to the test. The service of the inspection department had been of greater value during the past twelve months than during any other time in its history. A slacking demand for lumber inevitably brought a more technical inspection, yet wherever national inspection was in force a line was drawn beyond which neither the necessitous nor the greedy buyer could go. Because of the protection thus afforded to the members of the Association, some consumers had become restive, but united co-operation among the members of the National Hardwood Lumber Association would easily demonstrate that these consumers were in error, and also that the Association intended to wrong no one, but to see also that no one wronged its members. When this became thoroughly understood, the slight discord at present prevailing would pass away.

The secretary then gave a detailed analysis of the work of the Association during the year, referring to the growth in membership and also the increase in the quantity of lumber inspected, mention of which has been made above. He drew particular attention to the work of the reporting department which was established two years ago. Through this department the Association had been successful in furnishing information of great value to many members and had laid the basis for a successful reporting department. They had found that the majority of the large consumers throughout the United States and Canada were willing to extend their co-operation, not only by furnishing statements of assets and liabilities, but also by filing a list of their annual requirements in hardwoods, a feature not heretofore covered by any trade association or merchantable agency. The Association intended during the coming year to give this department closer attention, and, by introducing several new features, to establish a service of still greater value.

A motion was carried to the effect that the reports of the president and the secretary-treasurer be received and filed and that a committee of three be appointed to take up the recommendations contained in the reports. The president appointed the following committee for this purpose:—W. H. Russe, chairman; Fred A. Diggins, and Oliver O. Agler.

A committee was also appointed to consider all resolutions submitted to the convention before they were introduced on the floor. This committee was made up as follows:—Earl Palmer, chairman; Hugh McLean and Theodore Fathauer.

The report of the forestry committee was presented by the chairman, Mr. John M. Woods, and contained a strong plea for the removal of the management of the forest interests of the country from party politics. The experience of the past, and present conditions, together with the needs of the future, demanded that this great national asset should be placed under the control and management of men of wide forestry experience, absolutely honest, and of demonstrated business ability. It needed no prophet to foretell the future of the supply of merchantable timber of all kinds. Therefore it seemed to be a wise thing to begin, both in the State and in the Nation, a system of reforestation of land unsuitable for agriculture or for any other purpose except the growing of timber.

The report also referred in scathing terms to the apparent unwillingness of Congress to adopt definite or satisfactory forestry policy.

Reports were also presented by the transportation committee and the waterways committee.

At the convention on Thursday, June 18th, all the visiting members of the Association were entertained, by the Buffalo Lumber Exchange, to a trip to Niagara Falls. Twelve special cars left the hotel at 2 p.m., carrying the visitors and the Buffalo lumbermen. The trip included all the interesting points on both sides of the international boundary between Niagara Falls, Ont., and Lewiston on the American side, and Niagara Falls, Ont., and Queenston on the Canadian side. In the evening the guests were entertained at dinner at the Clifton Hotel, the Buffalo Lumber Exchange and the National Hardwood Association being their hosts.

On Friday, June 19th, the most interesting feature of the programme was an excellent address by Mr. E. F. Trefz, field secretary of the Chamber of Commerce, U.S.A., who spoke upon "The new crisis and the new patriotism."

All over the country to-day, Mr. Trefz said, there was a sweep of opinion against business. It was more serious than merely an attack against business institutions. It was an attack upon property rights. Business men were being awakened to a realization of their responsibilities and duties. The day had come when the welcher in business must show his colors. He had to wipe out the yellow streak and exercise a man's privileges. The business men must strike out straight from the shoulder and say out loud what they wanted their government to do, and then back it up. This could not be done playing the game differently and alone. Although hardwood lumbermen had their problems and were doing great things to solve them, they knew that organization was a great thing. By gathering together in an association they learned to have confidence in one another and to feel that they were backed up by men who were thinking along the same lines as they themselves.

Mr. Trefz believed that one reason why they were having so much difficulty in the United States to-day was that they were overcapaciated in their factories. If all of their factories would work full time for 90 days, he believed that they could produce anything that the people of the United States would actually want for a whole year.

All of them must work through one common centre. Two years ago the chamber of commerce of the United States had been organized at Washington on the call of Mr. Taft, who realized that the administration ought to be closer to all of the business interests of the country. One thousand men assembled at Washington and organized this Chamber. Within the last two years the Chamber of Commerce had become numerically the strongest federated commercial body in the world; an institution that brought together the lumber people, the shoe people, the steel people, the retailer, the wholesaler, manufacturers, the real estate dealer, all of the men who were engaged in business, and whenever a question came up that had to do with business, insofar as legislation was concerned, a referendum was taken on that subject. In that way, they were gradually getting one million and a quarter of business men to come together in close co-operation. But passing the referendum was not the whole thing. They must get the vote of the people and then back it up. Mr. Taft had vetoed the bill for the prosecution of trusts, which provided that there should be no prosecution of labor unions, or agricultural associations. Mr. Wilson had signed the bill. The Chamber of Commerce was now declaring that it was unconstitutional and contrary to the fundamental principles of American freedom to give any man a right that was not given to another man.

"I think a new patriotism is sweeping over this country and business men are realizing that it is becoming more and more difficult to keep what they have; that the course of many national problems is becoming suicidal and that it is doubtful whether the maxim, 'equal rights to all,' is in truth a fact. They are realizing that with less hammering of business, business men can accomplish a great deal more that will be for the best interests of all; and that is what the Chamber of Commerce of the United States is trying to do. Everything that it attempts to do is out in the open; everything that it does is done openly, is the subject of newspaper comment. There is nothing concealed by it. It simply presents the views of the various business communities throughout the country. When we take action, the result of our work is sent to the members of Congress."

"Our Congressmen and our representatives in the Senate are learning that business men are not asking anything that will harm the country, but that they are asking only for such things, for such legislative action as will bring about stable prosperity and the largest

amount of happiness to the greatest number; and we all know that business prosperity, the prosperity of our business men, contributes more than anything else perhaps to the general prosperity of this country."

"You and I know that we must know as much political economy and the things that are good for the business man as the average workman, who can sit down and talk political economy and do it quite intelligently. He is quite a student although unhappily only on one side of most important subjects. We must try to start a course of counter-education; give the people enlightened intelligence on these subjects and let them understand that the greatest wrong that can be inflicted upon a nation lies in the injustice of the judgment of the masses of the people. So the new patriotism calls to you and to me, to all of us, not to make an extra dollar, more that we are entitled to, in addition to what we already have, but to protect the dollars we have already made, because we are American citizens, and the permanence and stability of this country, the existence of its institutions rest upon your shoulders."

An event of interest to the Canadian members who were present at the meeting then took place, when the president called upon Mr. Gordon C. Edwards of Ottawa for a few words. On behalf of the National Wholesale Lumber Dealers' Association of which Mr. Edwards was recently elected president, he thanked the National Hardwood Association for their invitation to attend the Convention. The National wholesalers were greatly pleased he said at the progress made by the National Hardwood Association.

The Committee on Resolutions presented a number of resolutions which were adopted. One resolution which they had considered, but not adopted, was embodied in their report for the consideration of the Board of Directors. This resolution recommended that a school of instruction for hardwood lumber inspectors should be established at the headquarters of the Association; that an assistant chief of inspectors should be appointed to be in charge of the school of instruction and that he should examine all inspectors, permitting only those who were able to inspect within 2 per cent of the recorded inspection of the Board, to perform any Association work.

After a discussion on this resolution a motion was carried referring it to the executive committee.

The report of the inspection rules committee was presented by Mr. W. E. Chamberlin, chairman. This report referred briefly to the importance of the work done by the inspection department and concluded with recommendations for two additions to the rules.

The first addition was as follows:—

Plain sawn flitch lumber shall be graded according to the generai rule applying to the kind of lumber inspected, with the exception that it must be measured on the narrow or sap side in the centre of the piece between the wane or bark, and graded into any of the grades of No. 3 common and better, to which its quality entitles it. There is no restriction to heart in the grades of common. This rule does not apply to veneer flitches.

The second addition was as follows:—

Wormy beech shall be graded according to the rule for beech No. 2 common and better, with the exception that pin worm holes shall not be considered a defect.

The report was received and a motion was carried to the effect that the recommendations contained in it should be adopted.

The election of officers resulted as follows:—

President, E. V. Babcock, Pittsburgh, Pa.; first vice-president, J. V. Stimson, Huntingburg, Ind.; second vice-president, Hugh McLean, Buffalo, N.Y.; third vice-president, Fred L. Brown, Chicago. The following directors were elected for a term of three years each:—Edward Buckley, Manistee, Mich.; J. L. Kendall, Crellin, Md.; W. E. Chamberlin, Boston, Mass.; Chas. H. Barnaby, Greencastle, Ind.; W. J. Hetherington, Toronto, Ont.; Alex Schmitt, Cincinnati, O.; and M. J. Quinlan, Saperton, Wis.

The Canadian delegation present at the convention included the following:—A. E. Clark and R. L. Clark, Edward Clark & Sons, Toronto; Gordon C. Edwards, Ottawa; Guy Long and J. M. Donovan, Long Lumber Company, Hamilton; W. Gall, Toronto; W. J. Hetherington, Laking Lumber Company, Toronto; Robert Vestal and J. W. Jacobson, Atlantic Lumber Company, Toronto; J. E. Chamberlain, Toronto; Geo. Kinnon, Laking Lumber Company, Toronto; John A. McBean, McBean & Verrall, Toronto; A. J. DeLaplante, Daniel Ferguson, London, and Mr. J. J. Miller, Inspector for the National Hardwood Lumber Association at Toronto.

On Friday evening, June 19th, a complimentary banquet was given to the members by the Association and by the Buffalo Lumber Exchange, in the banquet hall of the Hotel Statler.

The Smart Turner Machine Company, Limited, Hamilton, Ont., are supplying the Imperial Oil Company, Sarnia, Ont., with one of their Vertical Triplex Pumps.

Three Types of Business Management

Second of Series of Three Articles Analyzing The Composition of the Manager's Policy—The Systematic Type

By E. St. Elmo Lewis*

SYSTEM is the rut in which some men are proud to live. It is the rut in which the thoughtless run without fear of serious catastrophe. System at its worst, affords the incompetent and indifferent a nice comfortable, easy way of doing things. They progress along the road that has already been marked for them, beaten down and road-rollered by the hundreds of feet of men who have gone before. Automatically, every New Year's Day, salaries are increased a few dollars a week, to the "soldier" as well as the worker. Automatically each one is checked up. If each has followed the system, he is ignored, but if he hasn't, he is called down. Each has learned a set, prescribed way of going through his work until, as the youngster said, "he could play the piano with his eyes shut." Under a systematic management a man doesn't have to think, but he does something and remembers! A great many go through their work just as they eat their meals. They eat them whether they want them or not. So they do their work whether it is useful or not.

When an Efficiency Commission investigated the Government Department at Washington, it found that government workers were making copies of original documents laboriously by hand. By the introduction of a photographic process of making these copies, a 75 per cent. saving of clerical time and 90 per cent. in cost was effected. $242,000 a year was saved in the handling of public documents. It was estimated that another $850,000 could be saved annually if the departments would properly standardize the handling and filing of correspondence.

Lack of Department Co-operation

The same discovery applies to the majority of business houses. Each department stands alone. To all intents it is separate business. This department files correspondence one way, this one has another, that one still another. If four or five departments have correspondence with the same customer, or prospect, even about the same thing, it is only rarely that the complete correspondence can be brought together without a very great deal of difficulty and trial. Why? Is it not because the management does not see the business as a whole, however thorough may be its grasp of details?

The systematic type of manager is a decided improvement on the rule-of-thumb type. The systematic type recognizes that there are some better methods of geting information about what is going on. He aims to find what is a good way to do things by comparing the results of the good, bad, and indifferent methods of the past. He is making the first step toward finding out the facts about his business The systematic type of manager has one drawback which is so common as to be almost universal—he is still thinking about things and not about people. To him a system is a chart of accounts, or a bunch of cards, or a vertical file, or a loose-leaf ledger with its accompaniment of books and forms and ideas about their handling, but still it leaves out the human element. He continues to believe that the man element is the uncertain, the unsystematic, the untrainable element. He does not think about men—how to train them—but he simply forces them into the grooves of handling a thing in a so-called systematic fashion. He makes them what he thinks they are—automatons.

System is, on the contrary a machine means to a humanizing end. Its primary purpose is to raise efficiency, and a system that doesn't raise efficiency is fallible, weak, impotent, in the way and a nuisance. The purpose of system is—

1. To keep a true record of what has actually happened.
2. To keep this record in such terms that the manager may readily translate it into the most productive action.
3. To insure a reliable, immediate, and accurate record, in order that the manager may determine standards relative to the practice of work, and the conditions surrounding the work, and the operation and their sequence, and fix an adequate reward for the best work.

Caught in the System Net

In the highly systematized type of management the man gets caught in the net of a pre-determined method of following the work, and can make no change from it, without dislocating the whole business routine. How often have you heard when you go into a retail store and you ask them to do something—"Well, we have never done it that way?" I once made a purchase of some hundred odd dollars in a jewelry store and asked them to deliver the purchase to a steamer. The clerk said that "The delivery doesn't go out until three o'clock." I had to have it delivered at two. In his routine way of thinking it never occurred to the clerk that he could have a special messenger

* Advertising Manager of the Burroughs Adding Machine Co.

do the delivering and even the head salesman had to "see if it could be done."

Mr. Harrington Emerson tells the story of a systematic government official. When he was living in Germany, there were only four official religions—Reformed, Lutheran, Catholic and Jewish. When Mr. Emerson was filling out the census blank for his father's family, he told the census official he wasn't a member of any of these four faiths, but he was told that he had to choose one of them or else be fined. Of course he chose!

In a business with which I was at one time connected there was a certain chart of accounts arranged, and you had to select which of these accounts a disbursement was to be charged to. New conditions arose, but the chart of accounts remained the same. Items, for instance, such as were used for the development of the sales organization were charged to advertising accounts, and the management of the company, therefore, got an entirely erroneous idea of the amount of money it was spending for advertising. Nearly a sixth of the amount of money charged to the advertising accounts never even remotely affected the state of mind of the prospective purchaser. The consequence was that the chart of accounts ran the business, and not the business the chart of accounts.

Worshipping Precedent

The systematic type of mind constantly falls back for precedent—it is traditional. Mr. H. G. Wells, in his thought-provoking book, "The Discovery of the Future," hits off this type of mind remarkably well.

"The Systematic type of mind—one might speak of as the legal or submissive type of mind, because the business, the practice, and the training of a lawyer disposes him toward it; he of all men must adhere constantly to the law made, the right established, the precedent set, and consistently ignore or condemn the thing that is only seeking to establish itself."

"The efficient type of mind I might for contrast call the legislative, organizing, or masterful type, because it is perpetually attacking and altering the established order of things, perpetually falling away from respect for what the past has given us. It sees the world as one great workshop and the present is no more than material for the future, for the thing that is yet destined to be. It is in the active mood of thought, while the former is in the passive; it is the mind of youth, it is the mind more manifest among the western nations, while the former is the mind of age, the mind of the 'Oriental.'"

Now, the important thing in management is to realize that we need the strenuous, we need the systematic, and we need the efficient. We need strenuosity to help fix quantity standards, because when the strenuous man is properly guided and handled, he gets a maximum quantity efficiency. But he must be guided.

The systematic type furnishes those reliable records by which we keep track of the efficiency, find it out and establish its standards. But left to himself without guidance, the systematic type of man runs to seed. He becomes petrified in the attitude of changeless superiority. It is only the efficient man that can be left alone, because he will not leave anything alone.

The systematic man, of course, is the stand-pat and conservative mind at work. He prefers to write history rather than prophecy. His mind is set towards the setting instead of the rising sun. He compares today's result with yesterday's result, instead of comparing it with the ideal standard of tomorrow.

The systematic manager inevitably curtails initiative in the plant, for he sets wage limits instead of work limits. He is not concerned about the value so much as he is concerned with the price.

Efficiency Involves Ideals

The efficient man is after what we shall do to be perfect. The systematic man is content if he has properly taken care of today in comparison with yesterday. The efficient man is principally concerned in seeing that tomorrow is taken care of in order that today will automatically be looked after.

Place the systematic man in charge of your cost work. He is perfectly content if he can devise a system that will attach a string to every dollar, with the consequence that in the hands of the small systematic men, a cost system rarely gives costs, though it produces a lot of figures.

The great fallacy in costs, as some of the efficiency experts have pointed out, is to generalize from the whole to a part, to apply data covering a ten-year period to a lesser period, down to a day. Averages are the pitfalls of the system-mad cost accountant. "The average temperature, or rainfall, ought not to be taken as the weather indication for an outing," is the witty way Mr. Emerson has put this failing.

Mr. Emerson in his book brings out one very important item by a very vivid comparison. There is a difference between expense and cost. If a salesman on the road paid 25 cents for a cigar with a hundred dollar bill and neglected to get the change, the trip cost you $100, but the expense was only 25 cents for the cigar. The systematic cost man wants only to know what becomes of the money, the material and the work, where it has gone. The efficient man wants to know what you have gotten for the money, and vitally important. if that you received in return for the money is worth the price. We have crude so-called cost systems which do not reflect the activities of a business at all. Merely because a man is systematic, merely because he has a system, is no indication that the system is telling him any usable facts about his business.

Cost Systems, Scientific and Otherwise

It is important therefore, in the establishment of a cost system to pre-determine what you want it to do.

You can't let a cost system just grow.

If you do let it grow, it will grow in many ways that will be expensive and bristling with misinformation pitfalls for your unwary judgment. Put in a cost system by all means. Bring to bear upon the problem the same concrete information, skill, experience and attention to scientific detail you would in making an installation of an electric power plant, or a transmission system.

As a matter of fact, what do you know about the matter of costs? What do you want a cost system to tell you? If you want to have a cost system to help produce a greater efficiency, then you want it to aid in a real managerial function. If you want it merely as a supplementary historical record to be tied into your accounts, then a mere cost system will do.

But make no mistake, that kind of a cost system will give precious little aid in raising the efficiency of management.

The cost system that doesn't tie up with production standards; that doesn't show how closely you have come to realizing the best way of doing anything; in other words, that doesn't give values as well as costs, is a misnomer, and one that is destined to breed narrow, cribbed and inefficient management. Therefore, any cost system should be, as Mr. Emerson points out, so arranged that it gives:

1. To the comptroller information that will show him where the money goes.

2. To the efficiency engineer information to show him whether standards are being realized.

3. To the manager, information to show him where his losses are occurring and his highest efficiencies are being realized.

In order to do this Mr. Emerson continues: "The requisition system must be increased. You apply requisitions to materials—why shouldn't you apply them to personal services and other charges?"

The Proper Care of Belts

By J. H. Walker, Gen. Mgr. Dominion Belting Co., Hamilton

There are very few users of belts who give them the proper care. In the first place, they should be put on with clamps, or other means adopted, to take all the stretch possible out before lacing or attaching with other fasteners.

Every belt should have a proper dressing applied occasionally to keep it in condition. By this means drying out is prevented, and belts retain their gripping qualities on pulleys, which means a retention of the original power transmission.

A belt dressing containing resin or mineral oils should not be used, as these ingredients are most detrimental. Never use a belt dressing containing animal oils on rubber, balata, or stitched cotton duck belting.

The proper time to apply belt dressing is when the plant is closed down for a day or so; for instance, Saturday, as by Monday morning it has had a chance to penetrate the belt and keep it soft and pliable.

If kept in this condition there is no excuse for anyone resorting to the questionable remedy of applying resin, or any sticky dressing to get the proper power out of belts.

Belts used in saw mills and other plants that are shut down during the winter months should be taken off, rolled up, and kept in a warm place. If left on the pulleys and exposed to the changeable atmospheric conditions of a Canadian winter they will certainly have deteriorated by the spring.

Carlessness in starting up machinery too quickly is liable to cause belts to slip on pulleys, thus injuring them. This can be obviated by putting on the power gradually, which gives belts a chance to get a grip on the pulleys.

Another important matter is to have proper alignment of pulleys, as many belts give out before their time owing to defects in this respect.

Another mistake made by some belting users is practising false economy in getting belts too light for the work they have to do. While a certain weight of belt may at first do the work required, if it is necessary to keep it on a constant strain to accomplish this, both belt and machinery are going to wear out much faster than if there is a "reserve." In other words, heavy enough belts should be used to insure their not being overstrained. This may cost a little more at first, but pays in the long run.

Grading Timber on the Strength Basis

Important Innovation Introduced by Yellow Pine Manufacturers To Establish a Satisfactory Means of Determining Grades

By A. T. North*

Heretofore the grading of timber has been confined to establishing the maximum permissible defects for each grade. There is a demand at present that timber be graded primarily on a basis of strength quality and that secondary consideration be given to the effect of defects and the permissible amount of the same. Timber is divided into groups by arbitrary lines of division and this is necessary because, as with all natural products, the material is not uniform. Therefore each grade is based on a minimum strength quality with a maximum of defects. This lack of uniformity in the material makes it necessary to have several grades for the same kind of timber.

The woods commercially available for structural use are confined to the conifers and of these the southern yellow pines furnish the bulk of the timber cut, with Douglas fir and the softer northern pines secondary in the order given.

Investigators of the mechanical properties of coniferous woods agree on the following laws which are quoted from the Forest Service bulletin No. 108.

"(1) The mechanical properties of timber beams are dependent upon (a) the quality of the wood irrespective of defects; (b) the character and location of defects.

"(2) The mechanical properties of wood free from defects vary directly with its dry weight. The relative dry weight of the different pieces of wood of any species can be approximated by comparing the proportion of summerwood in each.

"(3) The only defects which materially decrease the breaking strength of timber beams are the more serious ones, such as large knots and cross grains occurring where fibres are subjected to comparatively high stress.

"(4) All the species tested seem to be subject to the same general laws regarding the relation of mechanical to physical properties."

The grade of timber must of necessity be determined by visual inspection, owing to the lack of uniformity of the material. The cost of making an exact determination of the dry weight of each piece would be prohibitive, as it would be if each and every bag of cement were tested. Cement, being a mechanical product, is uniform and visual inspection is of no value. In timber we can see the physical characteristics and the defects, and easily determine the soundness of the material.

It is the heavy dry weight which makes the southern yellow pine the strongest of the coniferous woods and its high percentage of resinous content makes it the most desirable of the strong woods. For this reason it is the standard with which all other woods are compared.

The best known species of southern yellow pine are the loblolly, shortleaf and lonfleaf pines. The Cuban pine is not much known, as such, it being commonly grouped with the longleaf pines. It grows along the Gulf coast and owing to the soil and climatic conditions it has larger annular rings than the longleaf and is stronger as shown by circular No. 12, division of forestry.

The illustrations showing the range of the physical characteristics of the first three species mentioned are made from photographs furnished by the Forest Products Laboratory at Madison, Wis.

Loblolly Pine

Figure 1.—This specimen is the weakest grade, due to its having very wide rings and to the very small percentage of summerwood.

Figure 3.—This is an ordinary quality owing to the low percentage of summerwood and the wide rings.

Shortleaf Pine

Figure 4.—This is an illustration of the variation in this species, the specimen at the left having an average of eight rings per inch, with about 20 per cent of summerwood, and the other having an average of thirteen rings per inch with probably 50 per cent of summerwood.

Figures 5 and 6 also show the variation in this species.

Longleaf Pine

Figure 7.—These are very typical specimens of this species, close ringed with a large percentage of summerwood. The eccentricity of the heart centre is notable. J. W. Martin, of Ludington, La., states that this condition is found in trees that are inclined and that the longer radius and the larger roots are always on the upper side of the tree with reference to its inclination. Here is also shown the very small percentage of sapwood characteristic of this variety. The preceding statement concerning season checks is here verified.

Figure 8.—Referring to Figures, 2, 5 and 6 in connection with this figure, it is apparent why the counting of rings should be started at some distance from the heart centre, the scale in this case starting 2¼ inches from that point. This specimen would run probably 20 per cent of summerwood with an average of 12 rings per inch.

Figure 9 is a specimen showing regularity of ring widths, with unevenness of summerwood, owing to climatic conditions.

Figure 10 shows an unevenness of ring widths with a very large proportion of summerwood, ranging from 50 to 75 per cent.

These few illustrations will demonstrate the impossibility of determining the botanical variety of these woods after they are manufactured into timbers. Microscopic examination also fails in this regard.

In 1909, Committee Q of the American Society for Testing Materials presented a progress report on a method of determining the botanical species based on the average number of rings per inch measured over at least 5 inches across the face of the stick. This committee recommended that wood having 15 rings or more per inch be considered longleaf pine; 8 to 15 rings per inch shortleaf pine; any timber having less than an average of 8 rings per inch shall be considered so porous that it is unfit for structural purposes. This finding was based on measuring a large number of trees but not on a sufficiently wide

*An address delivered recently before the Western Society of Engineers, reproduced by courtesy of the Lumber World Review, of Chicago. Readers should bear in mind that this address was delivered before a United States Association and make allowance for a few comparative references to Douglas fir, etc., with which they may not be inclined to agree.

Fig. 1—Loblolly Pine of the weakest grade, showing the wide rings and small percentage of summer wood.

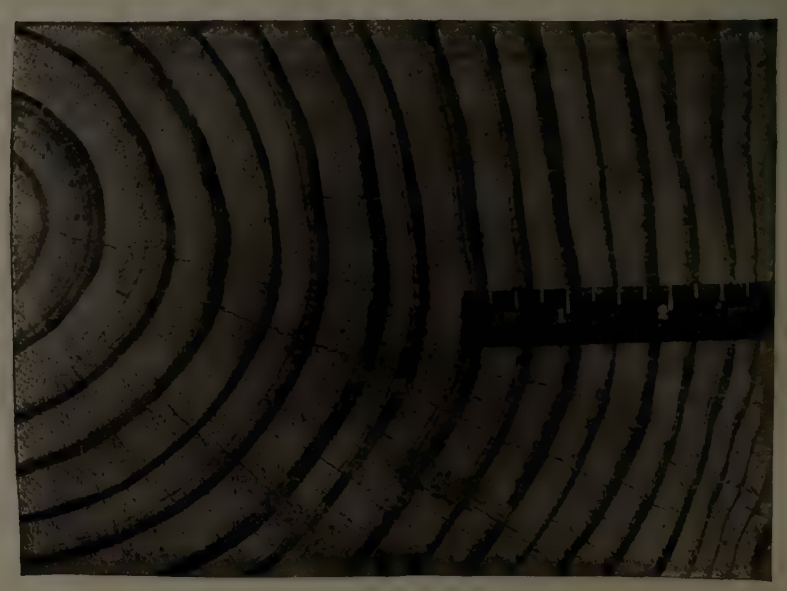

Fig. 3.—Loblolly Pine of the ordinary quality owing to the low percentage of summer wood and the wide rings.

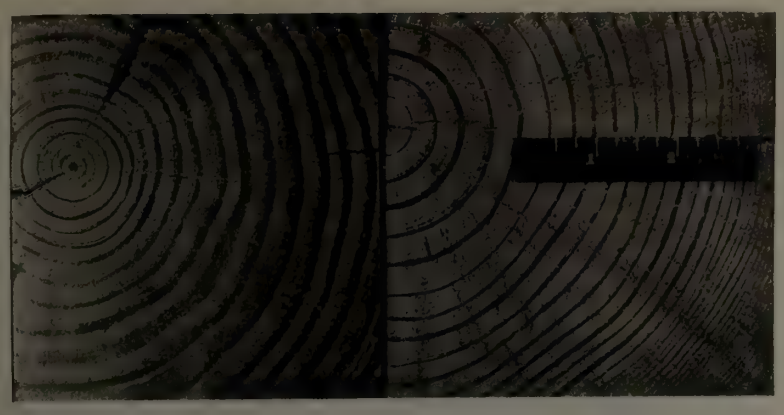

Fig 2—Loblolly Pine showing other specimens of the wide ring variety.

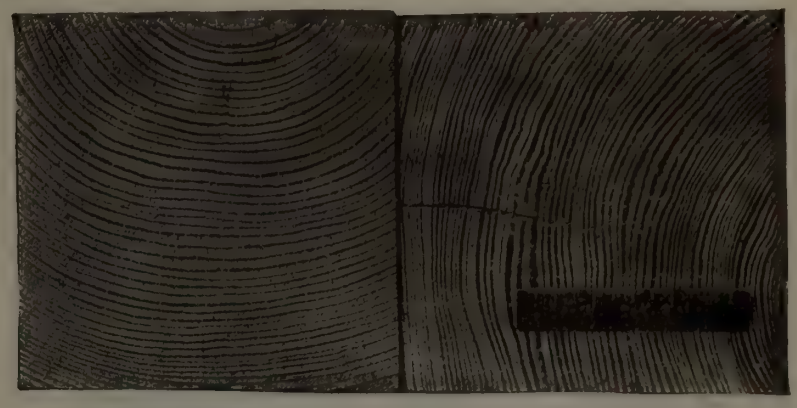

Fig. 4—Shortleaf Pine, showing the variation in the species.

range of soil and climatic conditions to be of value. (See report of the twelfth annual meeting, 1909, American Society for Testing Materials.) Climatic and soil conditions have a very important effect on the annual growth of the trees and a longleaf pine grown in southern Louisiana will look very different from one grown on the hills of central Alabama. It is apparent that this scheme of determining botanical species is not practical. The American Society for Testing Materials has never voted on or adopted any recommendation appertaining to this matter, although such an opinion prevails.

The number of rings per inch, with no other qualification, is not indicative of anything other than the mere fact that this number exists. It serves, however, when considered in connection with the percentage of summerwood, as an index of the dry weight of the timber which has a direct relation to its strength quality.

That there is an appreciable overlapping of the species is shown in Circular 15, division of forestry, wherein it appears that "the average highest 10 per cent of tests" on shortleaf and loblolly pine exceeded the average of all tests on longleaf pine by 14 per cent. This would show that a strict botanical classification would exclude much of the better grade of shortleaf pine which is superior to the "average lowest 10 per cent of tests" on longleaf pine.

The next public appearance of the rings per inch scheme is in Bulletin No. 108, Forest Service, issued September 23, 1912, which was preceded by Circular No. 189 in form of an advance report. From page 11, under topical heading of "southern yellow pine," is quoted: "The term 'southern yellow pine' is applied collectively to practically all of the pines of the southern states which are manufactured into lumber. On the market the manufactured lumber is divided into two classes, longleaf and shortleaf. Material with more than 8 or 10 rings per inch, and containing a comparatively large amount of summerwood and less than 30 per cent of sapwood, is called longleaf pine; while material with fewer than 10 rings per inch, slow-growing material that is light in weight and which contains much sapwood, is called shortleaf pine. Commercially, therefore, the terms 'longleaf' and 'shortleaf' are descriptive of quantity and have little botanical significance." This paragraph has a footnote reading: "See 'standard specifications for structural timbers,' American Society for Testing Materials." This is a very misleading statement. The "standard classification of structural timber, adopted September 1, 1907, reads: 'Southern Yellow Pine.'—Under this heading two classes of timbers are used, (a) longleaf pine, (b) shortleaf pine. It is understood that these two terms are descriptive of quality, rather than of botanical species. Thus, shortleaf pine would cover such species as are now known as North Carolina pine, loblolly pine and shortleaf pine. 'Longleaf pine' is descriptive of quality, and if Cuban, shortleaf or loblolly pine is grown under such conditions that it produces a large percentage of hard summerwood; so as to be equivalent to the wood produced by the true longleaf, it would be covered by the term 'longleaf pine.'" There is no mention of "rings per inch" but it accepts the best grades of the shortleaf, Cuban and loblolly pines as equal to the longleaf variety.

The quotation from Bulletin No. 108, above referred to, gave birth to a large number of specifications promulgated by various persons, corporations and proposed building codes. To an engineer the words "comparative" or "comparatively large amount of hard summerwood" appear ridiculous when applied to a quantity that can be measured by volume, weight or otherwise, and such a phrase incorporated in a specification or building code would only result in disputes and litigation.

On page 60 of this same bulletin is found a tentative grading rule consisting of a set of definitions and rules which can be applied to the grading of structural timbers cut from any of the species discussed in that bulletin, these species being: longleaf pine, shortleaf pine, loblolly pine, Douglas fir, western larch, tamarack, western hemlock, redwood, Norway pine, red spruce and white spruce. It will be noted that the Forest Service proposes to apply a ring rule to all of the woods above mentioned, but this idea is not yet generally accepted.

This tentative grading rule, considered aside from the permissible defects, is based on a definition of "dense wood" which is required in both grades. This quality, dense wood, is defined as:

1.—Wood that shows more than eight rings per inch, or the rings of which contain more than 30 per cent of summerwood.

2.—Wood which is resilient; that is, which when struck with a hammer or similar blunt instrument, gives a sharp, clear sound, while the hammer shows a marked tendency to rebound and the wood to recover from the effects of the blow.

These properties are to be judged from an inspection of the cross section of the timber.

Without discussing the permissible defects in these grades, it can be said that these rules are the first to define the location of defects. For this purpose the timber is divided into three volumes or zones. What is termed volume 1 is the lower quarter of the middle half, or the zone affected by tension; volume 2 is the upper quarter of the middle half, or the zone affected by compression; volume 3 is the balance of the stick, or the zone containing the neutral axis and affected by horizontal shear, compression perpendicular to the grain at ends and vertical shear. The consideration given to the location of defects in this rule is a notable advance in the formulating of such rules.

A recent purchase of yellow pine timbers for the Panama Canal was based on the following rule:

Quality No. 1: In large dimension or timbers there must show on the cross section at least six annual growth rings between the third

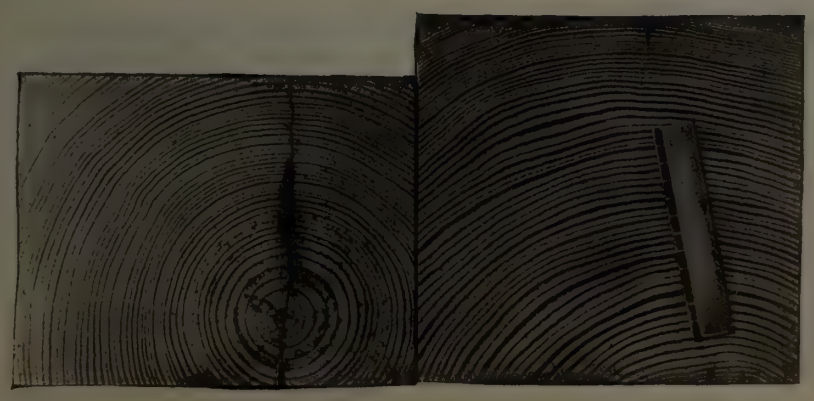

Fig. 5—Shortleaf Pine, showing further variations of species.

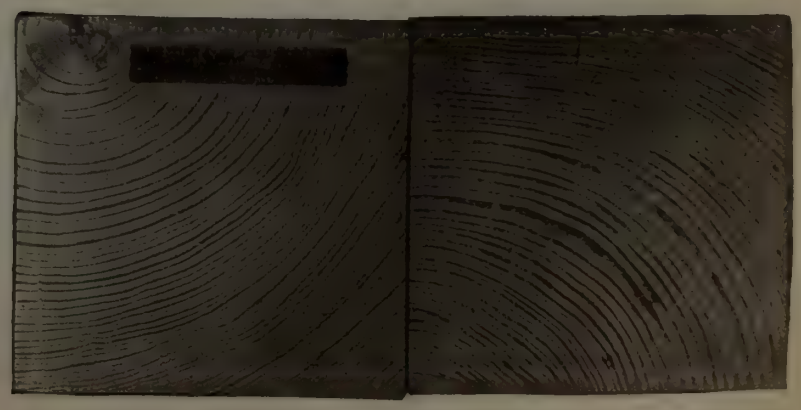

Fig. 6—Shortleaf Pine, showing further variations of species.

Fig. 7—Longleaf Pine; typical specimens, with close rings and a large percentage of summerwood.

Fig. 8—Longleaf Pine; this specimen would run about twenty percent of summerwood.

and fourth inch measured from the heart centre or pith; however, wide ringed material will be acceptable provided that in the greater number of the annual rings the dark ring is hard and in width equal to or greater than the adjacent light colored ring.

In small dimension material (up to 4 x 6's) where strength and durability are the prime considerations, there must be an average of six rings per inch over the entire cross section of the piece.

Quality No. 2: Yellow pine not meeting above specifications.

This rule was devised by O. T. Swan, in charge of industrial investigation, Forest Service, Washington, D.C. Concerning this rule, Mr. Swan states that it originated in a dispute between the Panama Canal inspectors and contractors over a cargo of longleaf pine sold under the Gulf Coast rules. There was a decidedly wide range in the quality of the material delivered and to settle the dispute the Forest Service was called in. By applying the rule above given, the matter was handled to the satisfaction of both parties. Later the rule was tried out in company with inspectors of the Pennsylvania railroad and the Boston Elevated railroad upon material on the different docks and was found to classify material in a way satisfactory for their purposes. Botanists connected with the Forest Service later made further investigations in the woods to afford an additional check on the rule.

The latest development in these matters was the adoption of a rule by the classification committee of structural material of the Yellow Pine Manufacturers' Association on May 4. The board of directors of this association approved the rule and it will be tentative until passed on by the association at its semi-annual convention in July.

There are two grades provided for and called "select structural" and "No. 1 structural."

Select Structural Grade: All timber shall be sound and sawed to standard sizes, dense, free from such defects as ring shake showing on the faces, injurious cross grain, unsound knots and decay.

Stringer forms must not have encased or large sound knots in volume 1; must not have large encased knots in volume 2, or unsound knots in volume 3. Beam, post, sill and other forms may have sound knots or hard, firm encased knots, the aggregate diameter of which does not exceed the width of the face they are in; but no one knot shall exceed 4 inches in diameter; stringer forms shall show three-quarter heart at any point on the narrow faces and post; beam and sill and other forms more nearly square shall show three-quarter heart on ali faces at any point.

The measurement of knots shall be at right angles with the grain of the knot.

No. 1 Structural: Shall include timber answering in all respects to select structural, except that a greater proportion of sap or no restriction as to sap will be allowed, making timbers suitable for treatment and distinguishing them from No. 1 common timber.

In the above rule dense wood is defined as follows: Having the following characteristics showing on the cross-section and appearing in the third, fourth and fifth inches of a radial line from the pith or heart centre; an average of six or seven rings, provided that in the greater number of rings one-fourth or more of the ring is summerwood; an average of six or seven rings, provided that in the greater number of the rings one-third or more of the ring is summerwood; or wider ringed material if in the greater number of rings one-half or more of the ring is summerwood; must show a sharp contrast in color between springwood and summerwood.

It is believed that this rule will supply the proper proportion of summerwood in the various combinations given to give a uniformly strong and durable wood. It is essential that the summerwood be dark in color showing a strong contrast with the springwood. In specimens where the summerwood is light in color it is found to be light in weight and consequently lacking in strength.

The increasing of the proportion of the summerwood in the wider ringed material is made necessary by the fact that this quicker growth material is generally more brittle and less strong than the closer ringed material.

This rule combines the inclusion of the wide ringed material as incorporated in the specification for the Panama Canal timbers and the location of defects as included in the tentative rule given in Bulletin No. 108.

This is the first rule promulgated by an association of producers which attempts to grade structural timbers for building purposes on a basis of strength quality, and is also the first rule that defines the location of defects in a scientific manner.

The classification committee of structural material of the Yellow Pine Manufacturers' Association consists of M. B. Nelson, chairman; I. H. Fetty, C. E. Slagle, W. J. Haynen, J. H. Eddy and J. W. Martin. They had the earnest and active assistance of Geo. K. Smith, secretary of the association; John A. Newlin, engineer in charge of timber tests, Forest Products Laboratory, Madison, Wis.; O. T. Swan, in charge of industrial investigation, Forest Service, Washington, D.C., and the writer. It represents the combined offerings of the practical woodsman, the lumber producer, the scientific investigator and the engineer.

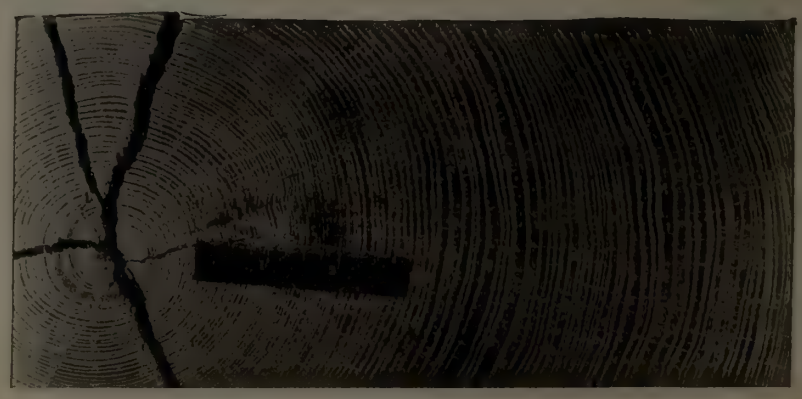

Fig. 10—Longleaf Pine; a specimen showing an unevenness of ring widths.

Production and Use of Pulpwood

Statistics for the Year 1913 and 1912 Prepared by Forestry Branch of Department of Interior

A bulletin dealing with the consumption of pulpwood in Canada during the year 1913 will be published in the near future by the Forestry Branch of the Department of the Interior. This bulletin is based on reports received from 48 firms operating pulp mills in Canada. Altogether 65 mills were operated by these firms as follows:—Quebec, 26 firms operating 34 mills; Ontario, 12 firms operating 17 mills; Nova Scotia, 4 firms operating 6 mills; New Brunswick, 4 firms operating 4 mills; and British Columbia, 2 firms operating 3 mills. In addition to these active firms reports were received from 10 firms whose mills were idle in 1913, and from 5 firms with mills under construction.

The 48 active firms reporting in 1913 consumed in their mills a total of 1,109,034 cords pulpwood valued at the mill at $7,243,368. A total of 1,035,030 cords of unmanufactured pulpwood valued at $7,070,571 was exported from Canada to the United States during the same year, bringing the total production of pulpwood to 2,144,064 cords valued at $14,313,939.

The quantity of pulpwood consumed in Canadian pulp mills in 1913 was an increase of 28.1 per cent over that of 1912. The average price of raw pulpwood at the mill increased by 51 cents a cord, making an increase of 38.9 per cent in the total value of the raw material used in this industry.

Quebec and Ontario still led the other provinces in 1913, as in 1912. British Columbia displaced Nova Scotia from fourth place on the list in 1912 and displaced New Brunswick from third place in 1913. This province now consumes 7.6 per cent of the pulpwood used in Canada and will probably increase this proportion in the future as the pulp industry on the Pacific Coast is still in its infancy. There was an increase in consumption in every province but Nova Scotia where the closing of four mills resulted in a decrease of 21.4 per cent. The increases were:—Quebec, 8.8 per cent; Ontario, 84.7 per cent; British Columbia, 140 per cent; New Brunswick, 2.1 per cent.

The average cost of pulpwood at the mill in Canada in 1913 was $6.53, an increase of 8.5 per cent from 1912. The cost increased in Quebec, Ontario, New Brunswick and Nova Scotia, and decreased in British Columbia.

Varieties of Wood Used

Only five kinds of wood were used in the manufacture of pulp in 1913. Spruce headed the list with over two-thirds of the total. The percentage of balsam fir used in pulp making has increased steadily as the prejudice against this wood have been overcome. In 1911 balsam formed 17.5 per cent of the total; in 1912, 19.0 per cent; and in 1913, 25.5 per cent. The wood has been found to make excellent pulp, equal in many cases to that made from spruce alone, but a prejudice existed against its use.

The manufacture of ground wood pulp still consumed over half (54.1 per cent) of the wood used for pulp making in Canada. This percentage has been decreasing in the last few years. The sulphite process, the most important of the chemical processes, was used in converting a third of the total quantity of wood into pulp in 1913. This proportion is practically the same as in 1912.

The increased manufacture of Kraft papers has caused an increased demand for pulp made by the sulphite process. This process was used with 12.3 per cent of the pulpwood in 1913, as compared to 7.7 per cent in 1912. The manufacture of soda pulp has greatly decreased, only 5,144 cords of wood being used for this process.

The active firms reporting pulp manufacture in 1913 each used on an average 23,105 cords of wood as compared to 18,042 in 1912. Each one of the individual 65 mills consumed an average of 17,062 cords of pulpwood. The largest individual mills are situated in British Columbia where the average mill consumption was 28,058 cords. Quebec has the greatest number of mills, and the average consumption of these was 18,527 cords. The average mill consumption in the other provinces was as follows:—Ontario, 18,897 cords; New Brunswick, 13,280 cords; and Nova Scotia, 5,140 cords.

So many conditions affect the average price of pulpwood that the figures cannot be taken too literally. Some mills purchase pulpwood on the open market and pay high prices for it plus the cost of transportation. Other firms own their limits and pay only the cost of cutting and transporting the material. The prices however, can be depended upon to indicate any important change from year to year.

In 1912 Canada manufactured 46.9 per cent of her pulpwood in her own mills. In 1913 this percentage increased to 51.7 per cent, and for the first time in the history of the industry more than half of the pulpwood produced in Canada was manufactured into pulp in Canadian pulp mills.

During 1913 each province, except Nova Scotia, used an increased proportion of its pulpwood for home manufacture. The greatly increased production of pulpwood in British Columbia together with the fact that this province manufactures practically all (99.9 per cent) of its pulpwood at home, is largely responsible for the increased proportion for the whole of Canada.

Effect of Prohibition of Export

Laws exist in Ontario whose strict enforcement has checked the export of raw pulpwood. In this province 79.1 per cent of the pulpwood is used in home manufacture. The exports of raw pulpwood have increased in Nova Scotia from 0.3 per cent in 1911 to 22.7 per cent in 1913. Laws prohibiting the export of raw pulpwood from Crown Lands in Quebec came into force in September 1, 1910. Since that time the export for the province has decreased steadily from 69.4 per cent in 1910 to 62.0 per cent in 1911, 56.5 per cent in 1912, and 56.0 per cent in 1913. This proportion probably represents approximately the proportion of pulpwood cut on Crown Lands and privately owned limits, and may remain stable for some time. In New Brunswick the restrictive legislation of October 1st, 1911, checked the export of raw material, and in 1913 a slight increase in the proportion of pulpwood consumed in the province is to be noted. This province still exports a greater proportion of its pulpwood in the raw state than any other.

Canada exported in 1913 to the United States 1,035,030 cords of unmanufactured pulpwood valued at $7,070,571 or at $6.83 a cord. Canadian pulp manufacturers operated 65 mills in that year. If the exported material had been manufactured into pulp in Canada it would have been sufficient to supply 60 mills each consuming 17,062 cords of pulpwood, the average consumption of Canada's 65 mills in 1913.

Canadian pulp mill operators paid an average price of $6.53 per cord for their raw material. The exporters received only 20 cents a cord more than this for the wood sent to the United States.

This 1,035,030 cords of pulpwood, if manufactured into pulp would have made 1,035,030 tons of ground wood, or 517,515 tons of chemical fibre. Groundwood pulp is worth at least $14 a ton, which would give $14,490,420 as the value of the pulp made from the wood exported in 1913. Had this wood been made into chemical fibre at an average price of $38 a ton its value would have been $19,665,570. In reality only $7,070,571 was received for this wood. The pulp industry lost the profit which could have been made by manufacturing this wood into pulp, and the country at large, lost the money which would have represented the cost of manufacture in the form of wages, etc.

Decreased Export of Wood Pulp

The export of wood pulp from Canada decreased from 1912 to 1913 by 22.4 per cent in spite of an increase of 25.2 per cent in the quantity manufactured. This would seem to indicate increased activity in the domestic manufacture of paper. Decreases are to be noted in the exports of pulp to the United States, Great Britain and China. New Zealand did not import Canadian pulp in 1913. The only increase reported was in the export of chemical pulp to Japan. The United States still takes about two-thirds of our pulp, of which about 70 per cent is groundwood.

The imports of wood-pulp into Canada in 1913 were valued at $356,862, as compared with $172,797 for 1912. This is an increase of over 100 per cent, the imports from the United States having more than tripled during 1913. The importation from Great Britain more than doubled and those from Germany increased by over half those in 1912.

The following table shows the quantity and value of pulpwood cut in the provinces of Canada during 1912 and 1913.

	No. of Active Firms	Quantity 1912 Cords M ft. B. M.	Quantity 1913 Cords M ft. B. M.	Per cent distribution 1913	Total value 1913 $	Average value Per M ft B. M. 1912 $ c.	Average value Per M ft B. M. 1913 $ c.
Canada	48	866,042	1,109,034	100.0	7,243,368	6.02	6.53
Quebec	26	578,855	629,934	56.8	4,107,689	5.85	6.52
Ontario	12	173,903	321,244	29.0	2,297,389	7.10	7.15
British Columbia	2	35,067	84,173	7.6	401,218	5.51	4.77
New Brunswick	4	52,041	53,121	4.8	342,243	5.52	6.44
Nova Scotia	4	26,176	20,562	1.8	94,829	4.32	4.61

The following table shows the pulpwood cut in 1912 and 1913 according to the kinds of wood.

	Quantity 1912 Cords M ft. B. M.	Quantity 1913 Cords M ft. B. M.	Per cent distribution 1913	Total value 1913 $	Average value Per M ft. B. M. 1912 $ c.	Average value Per M ft. B. M. 1913 $ c.
Total	866,042	1,109,034	100.0	7,243,368	6.02	6.53
Spruce	677,747	754,858	68.1	5,104,221	6.09	6.76
Balsam fir	164,587	283,292	25.5	1,806,911	5.81	6.38
Hemlock	19,178	47,360	4.3	201,480	5.53	4.25
Jack pine	40	19,383	1.7	101,675	4.00	5.25
Poplar	4,405	4,141	0.4	29,081	6.21	7.02

The average price of ground wood pulp increased by 87 cents and that of chemical fibre by $1.20, from 1912 to 1913. The price of mechanical pulp exported to the United States increased by only 2 cents a ton while the increase to Great Britain was $1.78. The price of chemical fibre exported to the United States increased by $1 32 and to Japan by $2.65. The chemical pulp exported to Great Britain was valued at a little more than half the value in the previous year. A reduction in price of $3.09 was also reported for the pulp exported to China.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted–Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 7-tf

Wanted

One or two blocks of Spruce, also Pine, must be well manufactured. Apply Box 31, Canada Lumberman, Toronto. 11-t.f.

Wanted To Buy

Two million No. 1, 2 and 3 Pine Lath and one million Hemlock Lath.

M. BRENNEN & SONS,
12-15 Hamilton, Ont.

Wanted

500,000 feet Hard Maple, 1½-in. to 4-in. Also 1-in. Basswood. Shipment Summer and Fall. Terms Cash. Box 32, Canada Lumberman, Toronto. 11-12

Wanted

1,000,000 ft. Spruce, 1-in., 1¼-in. and 2-in. If not already cut will give sawing instructions. Apply Box 30, Canada Lumberman, Toronto. 11-t.f.

Wanted

Soft Elm, 4/4 log run.
Birch, 5/4 log run.
Quote lowest prices F.O.B. mill for dry or new cut.

E. M. NICHOLSON,
Board of Trade Building,
9-t.f. Montreal, Que.

Wanted To Buy—1000 Birch Logs

fresh, clean, straight and sound, 14-in. and up diameter at small end, 8 ft. to 16 ft. long. Delivery to commence as soon as possible. Terms: 75 per cent. cash when alongside track at railway station, balance when loaded on cars. Write P. O. Box No. 1595, Montreal, stating best price. t.f.

For Sale–Lumber

For Sale

A few thousand slightly undersized ties, ready for shipment. Also cut of Jack Pine Lumber, ready for shipping in thirty days.

ANGUS PRENTICE,
Sellwood Junction, Ont., or
13 189 Arthur Street, Toronto.

Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.

GEO. C. GOODFELLOW,
c Montreal, Que.

A Bargain

150,000 ft. 2 x 4 and up 10/16 Merchantable White Pine.
70,000 ft. 6/4 x 4 and up 10/16 Merchantable White Pine.
1913 cut, bright nice stock, good end all in.
Get delivered price your station.

The A. Sherman Lumber Company,
13 Potsdam, N.Y.

We Own and Offer

subject to prior sale, the following Rock Maple lumber:

200,000 ft. 1sts and 2nds 4/4 in., $33 per M.
30,000 ft. No. 1 Com. 4/4 in., $23 per M.
30,000 ft. 1sts and 2nds 6/4 in., $35 per M.
10,000 ft. No. 1 Com., 6/4 in., $25 per M.
100,000 ft. 1sts and 2nds 8/4 in., $36 per M.
20,000 ft. No. 1 Com. 8/4 in., $26 per M.

These prices are all f.o.b. shipping point, on an easy rate of freight to New York and Boston.

c Apply Box 47, Canada Lumberman, Toronto, Ont.

For Sale–Machinery

For Sale—Cheap

1 Pony Planer, McGregor & Gourlay, 24-in., in good running condition.
1 Iron Saw Table 3 ft. x 5 ft., Ballantyne Tilting Guide.

Box 28, Canada Lumberman, Toronto. 11-13

WOODWORKING MACHINERY FOR SALE: 1 24-in. Champion planer, matcher and moulder; 1 10-in. Hespeler four-side moulder; 1 No. 619 Corporation saw table; 1 6½ ft. Crescent swing saw; 1 40-in. MacGregor-Gourlay pedestal bandsaw; 1 16-in. Ideal wood lathe; 1 Hespeler improved power mortiser; 1 Cowan panel raiser; 21 Cowan veneer-press screws; 1 No. 51 Crescent universal woodworker. H. W. PETRIE, LIMITED, Toronto. 13

Second Hand Machinery

150 to 175 h.p. Corliss Engine, 16-in. x 36-in., new two years ago.
75 to 100 h.p. Brown Automatic, 13-in. x 30-in., in excellent condition.
500 to 750 h.p. Buckeye; a good sawmill engine.
Boilers, 72-in. x 18-ft. and 54-in. x 14-ft.

THOMAS HOBBS,
Mail Building,
7-t.f. Toronto, Ont.

Wanted–Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents.

WANTED—Position as filer, band or circular. Can furnish best of references. Open after July 1st. Address Box 144, South River, Ont. 13-14

WANTED—Position as order clerk or shipper in the retail lumber business. Can take charge of shipping. Quick and accurate with figures. Box 42, Canada Lumberman, Toronto. 13

WANTED—Position in Saw or Planing Mill. Office and mill experience. Could take charge of Sales, or act as Mill Foreman or Yard Foreman. Excellent references. Box 44, Canada Lumberman, Toronto 13-16

LATH MILL man wants position running a lath mill by day or per thousand. Pacific Coast preferred. Fourteen years' experience and steady, but wishes to try the Coast. Good references. Box 45, Canada Lumberman, Toronto. 13

EXPERIENCED SUPERINTENDENT wants position to take charge of lumbering operations, bush, mill, etc. Desires a change. Can get results and furnish the highest credentials. Box 46, Canada Lumberman, Toronto. 13-17

Situation wanted by married man, thirty years old, as Accountant, Chief Clerk or Secretary-Treasurer in a Wholesale Lumber Firm. Ten years' experience. Best of recommendations. Apply to Accountant, P. O. Box 69, Three Rivers, Que. 12-18

A thoroughly practical lumberman wishes to connect with reliable firm either as salesman or buyer. Ten years as partner in well-known Ontario lumber firm—six years' experience selling on road. Familiar with every angle of lumber business. Would consider salary or commission proposition. Best of references. Full particulars from Box 37, Canada Lumberman, Toronto. 12-15

Situation as FORESTRY ADMINISTRATOR or in the LUMBER TRADE, wanted by two Swedish foresters, both of whom have matriculated, and also passed the higher course examination of the Royal Forestry Institute in Stockholm. Afterwards having positions in the Forestry Administration Department of the Swedish Government; in private Sawmills; and in Forest administration. Both speak English, German and French. One is 40 years old and has been for 5 years manager in a Swedish Sawmill, during which period he has personally attended to the planing, selling and dispatch of timber. The other is 33 years old ,and has during the past 3 years been factor on a Swedish estate, and personally handled every matter attendant upon the administration of a private forest. Correspondence gladly received, together or separately, to "Lumberman 40" or "Lumberman 33" c/o S. Gumaelii Annonce-bureau, Stockholm, Sweden. 13-14

Wanted–Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

WANTED—A young man with experience as salesman for sash and door factory. Apply to Box 38, Canada Lumberman, Toronto. 12-15

WANTED—An experienced Planerman, capable of setting up machine. State experience and give references. Address Foley Bros. & Nor. Constr. Co., Scott, via Ruel, Ont. 13

YARD FOREMAN wanted by medium sized factory in Western Ontario. Must be qualified to inspect hardwood lumber, and able to handle men unloading and piling. Apply, stating qualications, to Box 36, Canada Lumberman, Toronto. 12-13

WANTED—Salesman calling on the lumber trade and contractors in the Eastern Provinces, to handle Dr. J. M. Stewart's Veterinary Remedies as side line.

Palmer Medical Company, Ltd.,
10-t.t. Windsor, Ont.

Business Chances

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest. If your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf

For Sale

Rare bargain. Band mill located in best lumber and log center on Puget Sound. Rail and cargo shipping facilities. Excellent log pond. Ten and a half acres of land. Price one-fourth of appraised valuation. Must sell quick. Box 765, Canada Lumberman, Toronto, Ont. 8-t.f.

For Sale

Complete sawmill outfit. Machinery practically new. Capacity 20 M. Two boilers 60 and 40 h.p., with cold blast grates, endless log chain, 8-in. steam feed; 3 block carriage with boss dogs; friction canter and sweep; 3 saw edger; 2 saw trimmers and a full complement of saws and belting. Also Long Mfg. Co. lath mill in first class condition will be sold with sawmill or separately. Mill near White Hall, Ont. Apply to Box 41, Jordan Harbor, Ont. 11-14

For Sale

The best timber berth in Alberta, containing approximately one hundred million feet, four-fifths of which is splendid spruce. A railroad will pass within one mile of the limit this summer. The situation makes it an exceedingly easy limit to operate. Price $2.00 per M., easy terms. On account of its close proximity to the prairie markets and easy logging, this is cheaper than B. C. timber for nothing. For further information apply to Box 25, Canada Lumberman, Toronto. 11-14

Timber Sale

Tenders will be received by the undersigned up to noon of the 6th day of July, 1914, for the right to cut the Red and White Pine timber on Berths 1 B, 1 C, and 1 D, in the Mississaga Forest Reserve tributary to the north shore of Lake Huron, each Berth containing an area of 36 square miles, more or less.

For maps and conditions of sale apply to the undersigned or the Crown Timber Agents at Thessalon, Sault Ste. Marie, Webbwood and Sudbury.

W. H. HEARST,
Minister of Lands, Forests and Mines.
Toronto, April 18th, 1914.

N.B.—No unauthorized publication of this notice will be paid for. 9-13

Timber Sale

Tenders will be received by the undersigned up to noon of the 15th day of July, 1914, for the right to cut the Red and White Pine timber on berths 1, 2 and 3, Township of Blyth, in the District of Nipissing.

For maps and conditions of sale apply to the undersigned, or the Crown Timber Agents at Sudbury and North Bay.

W. H. HEARST,
Minister of Lands, Forests and Mines.
Toronto, May 4th, 1914.

N.B. No unauthorized publication of this notice will be paid for. 10-13

For Sale
Timber Limits and Saw Mill

Limits No. 59 River Gatineau, 3 square miles, and No. 483 Grand Lake Gatineau, 40 square miles, say 43 square miles, under Quebec Government Licenses. These limits are well wooded and contain Basswood, White and Red Pine, Spruce, Birch, Poplar, Cedar, Pulpwood, etc., also New Waterous 8-ft. Improved Double Cut Band Mill, fully equipped and up to date 200 H.P. Engine, 2 Boilers, Alligator, Boats, Booms, Logging Gear, Waggons, Trucks, etc., Buildings, Camping Outfit, etc., situated at Matts Bay, 31 Mile Lake, P.Q., about 50 miles from Ottawa. This plant has only been in use three years and is in condition to start operations at once.

For further particulars apply to

GUARANTY TRUST COMPANY, LTD.,
802 E. T. Bank Building,
263 St. James Street.

Sale of Pine Timber on Metagami Indian Reserve

Tenders will be received by the undersigned up to and including the 6th day of July next for the right to cut the Red, White and Jack Pine timber over eight inches in diameter on the Metagami Indian Reserve, situate on the Metagami River in the District of Sudbury.

For particulars, descriptions, conditions, etc., apply to the undersigned.

W. H. HEARST,
Minister of Lands, Forests and Mines.

Department of Lands, Forests and Mines,
Toronto, May 2nd, 1914.

No unauthorized publication of this notice will be paid for. 10-13

Tenders for Allan Water River Wood Limit

Tenders will be received by the undersigned up to and including Wednesday, the 15th of July next for the right to cut ties from Spruce, Balsam, Banksian or Jack Pine, Poplar and Whitewood trees seven inches and upwards in diameter two feet from the ground sufficient to supply a tie preserving plant for a period of twenty-one years from unoccupied, unsold and unlocated lands of the Crown tributary to what is known as the Allan Water River, tributary to the Grand Trunk Pacific Railway in the District of Thunder Bay.

Tenderers shall state the amount they are prepared to pay as bonus in addition to the Crown dues of $2 per thousand feet board measure for anything not manufactured into ties, and for ties at the rate of 5c each, or such other rates as may from time to time be fixed by the Lieutenant-Governor in Council.

Such tenderers shall be required to erect within the limits of the territory covered by the right to cut ties, or at some other place approved by the Lieutenant-Governor in Council a tie preserving plant.

Parties making tender will be required to deposit with their tender a marked cheque payable to the Honourable the Treasurer of the Province of Ontario for $25,000, to remain on deposit as security for the carrying out of the conditions of their tender.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

W. H. HEARST,
Minister of Lands, Forests and Mines.

Toronto, Ont., April 27th, 1914. 10-13

Miscellaneous

Saw Mill Machinery For Sale

Sawmill near Sellwood, Ontario, daily capacity 60,000 feet. All machinery including:—Log Ladder, Bullwheel, Steam Kicker, Log Loader, Stationary Steam Nigger, 42-in. Steel Carriage, 10-in. Steam Feed, 8 ft. Double Cutting Bandmill, Cast Iron Lumber Table, 5-Saw Slab Slasher, 48-in. Big Champion Edger, Trimmer, Transfers to Edger and Trimmer Tables, Sorting Tables, etc. Also, Independent Lathmill, Filing Room Outfit and Power Plant complete. This machinery is of the latest design, practically new and in excellent condition. Offers will be accepted for all or any part of this machinery, where it stands or F.O.B. cars Sellwood.

The Waterous Engine Works Company,
22-t.f. Brantford, Canada.

Do You Want to Buy or Sell?

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department."

Brazilian Walnut

A cabinet wood from South America, which passes in the market as Brazilian walnut, has made its appearance in England, Germany, France, and Italy, where it is regarded as of excellent quality. There are three kinds in trade, but it appears to be uncertain whether three species are represented or whether all belong to the same species and simply differ in color. The botanical names don't accompany descriptions of timber, and would amount to little as a means of identification if given, because the botanist has scarcely skimmed the surface of that country. The same tree has so many names, and so many woods pass under the same names, that the importer of Brazilian woods is never sure of what he is handling unless he sees them for himself, and even then he may be uncertain.

The Brazilian walnut being sold in England is of a yellow variety, a black, and one a grade between. Logs of this wood vary from sixteen inches to three feet in diameter, and up to thirty feet in length, and the wood has a weight of from forty to forty-eight pounds per cubic foot. The grain is fine and regular, and the wood is easy to work and takes a very high polish. It is the favorite wood for furniture in Brazil and Argentine, and may be specially recommended for the making of furniture, cabinet work, and panelling, as well as wagon construction and decoration, and both for interior and exterior work. Many of the large steamers running between Europe and America are panelled with Brazilian walnut most effectively.

A peculiar characteristic of Brazillian walnut is that it so quickly becomes darker with age, the fresh cut wood increasing in color and beauty a few days after it is cut and exposed, while even the lightest colored species, known as Canary walnut, acquires a rich brown hue, and the grain becomes more apparent when polished.

It is said that the supply of walnut in the South American forests can be depended on.

Waste of Wood in Industries

Each class of wood user is making use of material that formerly was considered waste.

The manufacturers of planing mill products no longer burn shavings and sawdust merely to get rid of it, but sell it for bedding and packing, for refrigerator cars, etc.; while the larger slabs and other pieces go into laths or bundles of kindlings.

Spruce and hemlock slabs and edgings are sometimes sold to sulphite pulp manufacturers.

The general millwork establishments in cities utilize most of their short pieces and odd lengths in one way or another, even to the turning of small pieces of beech into wooden button forms, clear hardwood short pieces into novelties, mirror and brush backs, and small strips into mouldings.

Several minor industries now depend upon the waste from the major industries for part of their raw material.

Toy and novelty manufacturers frequently obtain their stock from the fixture, furniture and general millwork men; camera works obtain the small blocks from the manufacturers of billiard cues; manufacturers of small chair sleds and toy wagons use odds and ends from furniture establishments; while the producers of small mallets and handles obtain much stock from large vehicle establishments.

Practical Briquetting

U. S. Consul-General R. E. Mansfield, of Vancouver, B.C., has made an interesting report upon the briquetting of sawdust as carried on by plants at Victoria and at Vancouver. At the former place bark and slabs are used, as well as sawdust, being passed through shredding machines and reduced to fine particles from the size of a match to a quarter of an inch in thickness. The material is entirely kiln-dried, then compressed by machinery into rolls 3 inches in diameter, which are held together by wrapping with a 7-ply jute string. No other bond or binder is used.

In the other process wood refuse 65 per cent., coal 25 per cent., and pitch tar or oil 10 per cent., are thoroughly mixed together and compressed in a machine having a maximum pressure of 10,000 pounds to the square inch.

The report gives cost of manufacture and of delivery within a mile of the factory at $3 a ton, which is much less than the cheapest grades of Pacific coast coal. Tests of the fuel have shown 8,614 British thermal units to the pound, with 2½ per cent. of ash.

Cleans a building of Rats and Mice in short time, keeps it cleaned, for it is always ready for use. Made of galvanized iron, can't get out of order, lasts for years. Large number can be caught daily. Go to Catcher mornings, remove device inside, which only takes few seconds, take out dead rats and mice, replace device, it is ready for another catch. Small piece cheese is used, doing away with poisons. Catcher is 18 inches high, 10 inches diameter. When rats pass device they die, no marks left on them. Catcher is always clean. One of these Catchers set in a livery stable in Scranton, Pa., caught over 100 rats in a month. One sent prepaid to any place in Canada or United States upon receipt of $3. Catcher, 8 in. high, for mice only, prepaid $1. On account of shipping charges being prepaid, remittance is requested with order.

Review of Current Trade Conditions

Ontario

Lumber trade conditions in Ontario show no important change, but a few reports which have recently been received by the Canada Lumberman indicate that many of the retailers are enjoying quite satisfactory trade, and that conditions may be expected to improve rather steadily, as soon as any important general factors for improvement are reported, such as a really satisfactory crop. One report recently received is of a specially interesting nature. The writer states that up to the present month business has been better than in any previous year and that he is finding great difficulty in filling his orders promptly. The same dealer has on his books more orders than at any previous time. Another firm reports that its trade is increased 150 per cent this year. A third firm which handles finish stock states that it is doing more business in the finish line this year than last. Still another states that he never had brighter prospects, especially in connection with shingles. Another retailer states that his business this year is in a prosperous condition and as good as in an average year.

One may find also many reports of an opposite nature, but it is noticeable that these come more from wholesalers than from retailers. Apparently, the retailers laid in fairly good stocks early in the year and have not yet found it necessary to replenish to any great extent, so that the wholesaler is still finding trade rather quiet. A continuation of present conditions however, and the surety of a good crop, should combine in the near futuer to improve the wholesale trade. This condition, when it develops, is likely to meet with a shortage in production at the mills, as a result of the poor driving conditions which have existed this year. With a little encouragement therefore, it is not unlikely that trade will show a very gratifying improvement towards the end of the present summer or early in the fall. These are not confident predictions, because many things may happen between now and then, but it is unquestionable that the situation points to the possibility of developments such as those which have been outlined above.

Trade continues quiet in the Ottawa district. Continued dry weather has affected the mills to some extent, as it is feared that the supply of logs will be insufficient to keep them all going throughout the sawing season. Some prices have shown a tendency to ease off during the past fortnight, particularly pine good strips which are about $2 lower at $38 to $40. A similar drop is reported in pine good shorts, 1-in. x 7-in. which are now selling at $40 to $42.

Eastern Canada

The lumber trade at Montreal and throughout Quebec province continues very quiet. In the large centres, the high values of land are preventing an increase in building operations. Labor is also expensive and contractors are feeling the pinch considerably. There is a good demand for houses, but the profit for contractors is small. The result is not promising. Collections are slow, especially among retail firms. The outlook for the export season is not very bright, as none of the important shippers will send large amounts of lumber to Great Britain. The groundwood market is quiet and there is not much demand for pulp from the United States. A little improvement is noted in the demand for chemical pulp, but prices are still below those of a year ago.

Trade has continued on a fairly active basis at St. John, N.B., during the past fortnight. Local business growing out of the house building line is good. A gradual improvement has occurred in all lines since spring. English deals have all been sold. Rafting and sorting operations at Fredericton have been going ahead rapidly and successfully. Shippers of English deals are not sending much stock across at present, preferring to hold back so as to steady the market on the other side. The American market is quiet, although in New York considerable improvement is reported. New England business is not as good as it was earlier in the season. Prices show no change.

Great Britain

The lumber trade at London continues quiet and importers are not inclined to make any new transactions unelss they can secure an important advantage in price. There is a feeling of uncertainty as to what the future may show, and buyers are inclined to avoid danger if possible. Last year's stocks are now practically cleared. Joiners stuff is very scarce and continue at a steady price. Deliveries at London docks for the week ending June 6th amounted to 7,819 standards as compared with 6,940 standards in the corresponding week of last year. At Foy Morgan & Company's recent auction sale Quebec spruce, 3 x 9, 3rd, was sold at £11 10s., 5th at £9 5s., 3 x 8 and 3 x 7 unsorted at £9 15s., and £9 10s., 3 x 7, 2nd, at £9 15s.

Board of Trade reports for May show a decrease of imports and exports compared with last year, but a substantial increase over 1912. At Liverpool, a lull is reported in the spruce c.i.f. market. Shippers are not very anxious to place their stocks for future delivery and very little is offering. The Timber Trades Journal, in a recent issue says regarding this point, that there is still a large quantity to come over later on, but a considerable quantity of logs have been hung up in the rivers and it is at present very doubtful if these will be available. "Whether this has anything to do with the shippers' attitude remains to be seen" says the journal, "but it is certainly true that about the only goods on offer are practically all from the lower parts. The better class of deals will not be over plentiful, and importers who have already secured cargoes at reasonable quotations will not be ill-advised to ignore as far as possible existing conditions and wait for their arrival before sacrificing just to realize." Spot demand is not very good, the main idea being to turn over goods in order to avoid putting them into stock. Consumers are buying only for immediate requirements, expecting to do better later on.

Birch c.i.f. transactions are not numerous at Liverpool. Values however, are well maintained. Importers have not been making many contracts for birch logs at the high prevailing prices. The drop in freight rates has made recent quotations more reasonable, but speculation is rather light. Imports of birch planks have been a little heavier than the demand requires. The spot demand is fairly steady, with indications of improvement.

United States

Reports from northern points in the United States indicate that a broadening of business has commenced and that northern pine is showing the effects of the good crop outlook. Retail business is apparently on the increase and orders for stock from retailers are more numerous. Farmers are apparently taking advantage of the lull in field work to make a few repairs. Northern pine is feeling the improvement more than hemlock and manufacturers are expecting improvement as the year advances. A report from Minneapolis states that retail yards are selling a great deal more stock than they were a month ago. Warm weather has benefitted retail trade considerably. Traffic is also showing an increase. In the larger cities, there is quite an extensive consumption of lumber in building operations. The country trade is more or less restricted, but is expected to improve during the next few months. The northern pine situation is fairly satisfactory Although sales have not been as extensive this year as last, production has also fallen off and prices have held fairly well.

The hemlock market is not so satisfactory as the northern pine market, and there is a great deal of difference of opinion as to actual conditions. However, those who are handling hemlock seem to be busy, although most of the buying is in small lots at frequent intervals. Hemlock manufacturers are expecting to share in any improvement which follows the good crop which is now indicated.

Dealers in northern hardwoods seem to be enjoying a fairly steady trade. The demand is just about holding its own. Prices are firm. Furniture factories appear to have been buying steadily and to be enjoying a fair amount of business. Future buying is quite general among furniture dealers. Implement factories have been consuming extensively during the past two months. Car construction has been backward on account of the conservative stand taken by the railroads. The general opinion seems to be that at the end of the season there will not be much of this year's cut of hardwood left in the piles.

At Buffalo, building operations are going ahead at quite a good rate, but no increase has developed in the demand for hardwoods. Some improvement is reported in the demand for hemlock, especially in small lots. Shingles and lath are unchanged, but the demand is good. Southern pine is not showing any improvement. The better grades of northern pine are in small demand, but a fair business is reported in the common trade. A slight improvement is reported in the northern pine trade at Tonawanda. Shingles and lath are not showing any improvement. Small orders for hemlock are frequent. The hardwood market is rather poor.

Mr. William Rutherford, of William Rutherford Sons Company, Montreal, has been elected a member of the Education Committee of the Canadian Manufacturers' Association. Mr. J. A. Riordon, of the Riordon Pulp and Paper Company, Toronto, is a member of the Transportation Committee, and Mr. Carl Riordon, Montreal, of the executive council.

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

Montreal Market Still Very Quiet

Montreal, June 25th (Special to the Canada Lumberman): In almost every direction there is the same complaint of lack of orders. We are experiencing the inevitable reaction from the days of booming trade, and although conditions are not as bad as some pessimists are proclaiming, there is no doubt that business is not, generally speaking, on a large scale. The high values of land are restricting building operations, and the heavier cost of labour is also handicapping contractors. The demand for houses is as great as ever, but many contractors say that there is comparatively little profit in residences and flats. Under all these circumstances, it is only to be expected that the lumber trade is not nearly as brisk as it was, and that the outlook is not promising.

Collections are by no means satisfactory, and this applies particularly to retail firms.

The export season promises to be one of the poorest for several years. None of the principal shippers are sending any large quantities of lumber to Great Britain, and, unless there is a strong revival, the exports will be far below those of last season. A good indication of the small amount of lumber offering is the reduction in steamship freight to 33s. 9d., compared with 42s. 6d. twelve months ago.

There is little change in the groundwood market. The low water conditions in Canada continue, and there is little demand for pulp from the United States. Prices are unchanged.

For chemical, inquiries are slightly better, while in the United States, there is an increase in the demand. Quotations, however, are not equal to those of last year.

The following official figures of exports of chemical and groundwood pulp and newsprint, for the fiscal year ending March 30 last, show a moderate increase in chemical, a slight gain in groundwood, and more than double of newsprint.

Month 1913	Chemical pulp $	Mechanical pulp $	Newsprint. $
April	202,110	143,126	596,554
May	201,276	234,494	810,554
June	121,199	173,445	874,284
July	218,302	251,284	793,898
August	203,542	276,171	889,645
September	232,835	399,057	941,986
October	233,159	467,878	976,028
November	273,278	357,688	1,037,207
December	311,251	450,030	1,057,817
1914			
January	257,194	265,750	928,223
February	254,250	174,522	1,049,778
March	414,687	259,296	1,432,850
Year 1913-4	2,923,082	3,441,741	11,386,845
Year 1912-3	2,100,842	3,408 702	5,692,126

St. John Market Holding Steady

St. John, N.B., June 22; (Special to the Canada Lumberman).—The market at St. John has not lost any of the improvement noted in the last reports. In fact, locally, business is good in the house building line. Of course, no very heavy construction work is going on, but a gradual improvement in all lines has taken place since spring. Prices have not risen at all. All the deals for the English market have been sold. This leaves only the side boards and smaller stock for sale, which in some cases have been disposed of for the entire season.

About all the logs which are being driven down the St. John river have arrived at the Fredericton booms. The rafting operations which began June 10th are being carried on with great rapidity under the new arrangement. This way of rafting has done away with the use of boom poles across the logs and also much sorting of marks. Many mills in the past had a lot of different operators and their marks were all separated and rafted by themselves, which caused a very heavy expense. This has now been done away with and each mill rafts all its marks together, about 40 to 50 million logs are now in the booms.

English deals are not being shipped from here to any great extent, as the shippers are holding back what they can, so as to steady the market on the other side all they possibly can. Of course during July and August the shippers will be forced to take away a certain amount of stock from the mills, so as to keep the mills supplied with piling room.

The American market is not showing any great improvement. In fact, in New England, business is not so good as it was earlier in the season, but in New York business is much better, although it is doubtful if it will continue so, as the heat of summer necessarily retards construction work. Messrs. Stetson, Cutler & Company are shipping quite a lot, especially during the last two weeks, all going to the American market. Prices remain about the same as in the last report. Laths remain unchanged, demand being fair. Low grade stocks are in good demand; shingles show no improvement at all. The box shook trade is not so good as in early spring, but this is always a dull time in the trade, which will undoubtedly show some improvement during the next month.

Prices Easier at Ottawa

Ottawa, June 23 (Special to the Canada Lumberman): Trade continues to be far from brisk throughout the Ottawa district. The prolonged dry weather, which has lasted for several weeks, being broken only by a few hours heavy downpour last Friday, is not helping to improve things. Though none of the mills on the streams tributary to the Ottawa have closed, they are being considerably handicapped through lack of water.

There have been several changes in prices during the last two weeks, chiefly in pine, some of the high grades falling off owing to lack of demand for them. Pine good strips, which formerly sold at $40 to $42 have dropped to $38 and $40; pine good shorts, 1-in. x 7-in., and up have fallen to $40 and $42 from $42 and $44; pine good shorts, 1-in. x 4-in. to 6-in., formerly $32 to $35 are now $30 to $35; pine 8-in., s.c., 12 ft. to 16 ft., which were $26 to $27 have dropped to $25 to $26 and other grades of mill cull, strips and sidings have been reduced from $1 to $2.

When the Ontario government's conservation dam at Lake Kippewa broke last week a large number of logs in the reserve above the dams were washed through into the Ottawa river with the big volume of water that rushed through the broken dam. At this time of the year, when water is none too plentiful in the Ottawa, the break has proven a benefit to lumbermen. The break tore away two large concrete piers and a hole 61 feet long was torn in the concrete work of the dam. This is the second break in the structure within the last two years.

Boston Trade Still Dull

The Shepard & Morse Lumber Company, Boston, Mass., under date of June 19th, report that there are no developments in trade worthy of particular notice, as business continues on the same dull basis, with a tendency towards sagging of prices. The volume of business, they say, is not over 60 per cent of normal, and they do not expect much improvement until the fall, when it may come, or may not. Discussing prices, the company say that they think that there have been no special changes in prices recently, except perhaps that clear cedar shingles have dropped off 10c to $2.90 and clear whites to about $2.45, while the 16-in. Washington red cedar shingles are at about $3.35.

Liverpool Market and Price Report

Farnworth & Jardine in their monthly wood circular under date of Liverpool, June 1st, report as follows:—In the business of the past month there is practically no change to report. The arrivals generally were not excessive, but the demand is quiet, the consumption rather disappointing, and values difficult to maintain. Stocks of some of the leading articles are still too large. Ocean deal freights continue on a low basis.

Canadian woods—Pine timber—There is no improvement in the market to report. Waney pine—1st Class: Arrival consists of one small parcel to Liverpool; consumption is merely nominal; the demand is dull, and stocks, though moderate, are sufficient. 2nd Class: No arrivals, and little enquiry. Red pine—No change. Oak.—No imports; stocks, largely held in Manchester, are further reduced; the demand is dull, but prices remain steady. Elm.—A small import to Manchester, but no deliveries; moderate enquiry, with prices firm; a small parcel of round wood arrived in Liverpool against contract. Pine deals.—Light imports to both Liverpool and Manchester; deliveries have been disappointing; the demand is dull, but prices remain steady. Red pine deals.—Slightly improved consumption, but the demand is far from active.

New Brunswick and Nova Scotia spruce and pine deals.—The im-

Exercise

Exercise your muscles for your physical welfare and Exercise your judgment for your business welfare.

You can exercise no better judgment in the selection of your requirements for Dressed Spruce than to use Fenderson's, the "Quality Stock." This stock is the standard by which Dressed Spruce values are judged.

We have never aimed to make the lowest prices—but we always do give the greatest value for every dollar. It's like your clothes. You can buy them for half what you are paying, not as good, of course. It's the same question of value.

Dry stock—prompt shipment—smoothest dressing—best grades.

Try Fenderson Service

You'll like it.

port during May to the Mersey (including Manchester) amounted to 3,600 standards, against 5,530 standards the corresponding month last year, about 55 per cent. being to Liverpool; deliveries show a slight improvement, and the stock is somewhat reduced, but still too heavy; sales are difficult; values easier. Pine deals show no change.

Birch.—Logs—Arrivals amounted to 39,000 cubic feet, the bulk being from St. John and Halifax; deliveries, chiefly from Liverpool stocks, have been fairly satisfactory, but hardly kept pace with the import; prices remain firm. Planks—Imports came forward more freely, but deliveries have been satisfactory; stocks are still fairly moderate, and values firm.

Prices current on Canadian goods are as follows:—

London Market Report

Churchill & Sim, in their monthly wood circular, under date of London, Eng., June 4th, say:—

There is a reduction in the overside deliveries for May of some 1,900 standard as compared with last season's figures, the total consumption in the London area, as gauged by dock and overside returns, being about 87,000 standards to date, and thus practically identical with the 1913 quantities. These figures must be considered satisfactory in view of the continuing inability of masters and men to come to any agreement over matters in dispute in the building trade. A great amount of caution has been displayed by importers during the month, and large contracts have only been possible where shippers have been willing to meet the market; nevertheless the aggregate of business at about the April figures has been considerable, and, as stocks in this country are getting well reduced, more buyers are coming into the market at the current prices of the day.

The stock of timber, deals, etc., at the public docks on June 1st included the following:—

		1914.	1913.	1912.	1911.
Colonial Pine Deals and Battens in	Pieces	475,000	359,000	329,000	380,000
Red Pine	"	17,000	20,000	36,000	47,000
Spruce ditto	"	629,000	451,000	402,000	452,000
Oak Timber	in Loads	.....	.....	.....	32
Oak Planks, etc. (American)	"	3,695	1,592	1,972	1,271
Birch Timber	"	255	172	151	88
Birch Planks	"	4,243	3,679	2,819	2,373
Elm Timber	"	2,003	243	124	676
Ash Timber	"	28	.....	.....	.....
Yellow Pine Timber	"	873	624	233	125

From the St. Lawrence the importation was as follows:—

Pine deals, 17,000 pieces, against 16,000 pieces in 1913.

Spruce deals, 2,000 pieces, against none in 1913.

Birch planks, none, against 5,000 pieces in 1913.

and from New Brunswick:—

Pine deals, 3,000 pieces, against none in 1913.

Spruce deals, 102,000 pieces, against 227,000 pieces in 1913.

Birch planks, 200,000 pieces, against 184,000 pieces in 1913.

The importation of pine and spruce has so far been limited to one parcel, mostly pine. A considerable clearance sale of pine, mostly in board sizes, shows that the market values quality, but is indifferent to inferior parcels except at heavy reductions. There is still a fair stock of spruce on hand, but the small supply from Riga is holding prices from slipping back, and some few sales of lower port spruce have been effected at no reduction in values. A fair supply of birch planks arrived during the month, and prices were fully maintained.

British Columbian and Oregon Pine.—A sailing cargo, mainly of timber, arrived during the month and the stock is now too heavy. The downward course of the freight market for sailing cargoes appears to have been checked, but a great deal of patience will have to be exercised before values in London can recover their lost ground.

Liverpool and Manchester Stocks

H. W. Lightburne & Company, Liverpool, Eng., furnish the following report upon Liverpool and Manchester stocks on June 18th:—

What Saws Are Best for Small Logs

Editor Canada Lumberman:— Westboro, Ont., June 13th.

As I have had a long and practical experience in building and operating sawmills, I might give you some facts regarding the use of saws. The band saw, if properly fitted up, is the best for certain kinds of work, particularly large and medium sized and defective logs. If we could have strictly sound logs, the same as we once had on the Ottawa, then I would recommend the band and gang, too.

Some would prefer the band resaw to the gang; I would, too, providing that it has proper length of stroke, which, according to my experience should not be less than twenty inches for the above work.

The gang and band resaw both waste lumber if the logs are defective. With the resaw the piece has to be cut double thickness and the sawyer cannot choose the best as if he were taking off only one board in thickness. With the gang, when the cant is passed through it there is no pick or choice, for the lumber is made the same as the saws are set up for, regardless of quality.

Therefore, the band saw and carriage, and that machine alone, to my mind, and according to my experience, is the only one from which can be made the different sizes, according to quality. Some may advise a large circular saw for the above work, but for many reasons the band saw is preferable.

Now we come to the question of small logs, which is of interest to all lumbermen making sawn lumber. The logs are being taken out much smaller now than twenty years ago, and much rougher, too. In consequence of this the machinery for making the lumber requires to be strong and substantial, even if the logs are small. Many of them are taken out of the branches if they will make six inches diameter. In many cases they are a mass of knots and difficult to saw. If they are sawn fast the face of the lumber is rough, and the boards of uneven thickness. If sawn at a moderate speed the quantity is not made, and, as the lumber at best is not a high grade, it makes the small log question a difficult one to solve.

I visited a mill recently where they were sawing logs which averaged about 33 feet board measure. They split the log through the centre with a band saw and finished it on a horizontal band resaw by passing each half through and back. They were making about forty thousand feet per day with twelve men. I must say the face of the lumber was not smooth. Neither were the boards of even thickness, especially from the very knotty logs. In fact, much of the lumber was not merchantable.

It is all very well to see lumber passing through a machine very fast, but the matter is very different when the lumber is being shipped, if the inspector rejects 25 per cent. of it for bad sawing.

My experience has been that to have a saw do good, smooth, straight work there is a limit to the speed of the saw, and to the feed as well, and if we exceed that limit, rough uneven sawing is the result, it matters not what machine or saw is used.—I. N. Kendall.

In connection with new financing recently carried out by this company whereby $150,000 additional working capital was provided by the shareholders, certain changes in the management have taken place through the retirement of Mr. T. F. Kenny as General Manager. In future Mr. T. H. Watso, the newly elected President, will assume these duties and take an active part in directing the company's affairs.

Profit

from

Low Value Lumber

THE LINDERMAN AUTOMATIC DOVETAIL GLUE JOINTER will enable you to solve three important problems YIELDING $4.00 to $6.00 MORE PROFIT PER THOUSAND.

1st. 4-in. COMMON LUMBER.

In most Western Mills this is sold for approximately $7.50 per thousand, whereas 8-in. shiplap brings from $14.00 to $16.00.

THE LINDERMAN DOVETAILER will take two 4-in. strips, convert them into a board 7¾ in. wide, allowing ½-in. for jointing both edges to make the lap, leaving a full 7-in. face, at a cost of .75c per thousand board feet. Add the cost of handling the lumber and of milling it into shiplap, leaves a net profit of at least $4.00 a thousand.

2nd. No. 3 GRADES, 6-in., 8-in. and 10-in. wide.

In most Western Mills No. 3 Grades increase in price perceptibly as it increases in width. One prominent lumber manufacturer maintains by converting 6-in., 8-in. and 10-in. widths of this grade into 12-in., 14-in. and 16-in. lumber, he will be able to obtain fully $4.00 a thousand more for it.

The cost of jointing this lumber on a LINDERMAN MACHINE is .75c per thousand, leaving a net profit of $3.25.

3rd. 2-in. and 3-in. STRIPS.

Practically all mills leave in the slab or convert into lath all lumber, regardless of grade, under 4-in. in width. By installing a LINDERMAN MACHINE and by saving all 2-in., 2½-in., 3-in. and 3½-in. stock this lumber can be converted into any width board desired at a cost which will average approximately $1.00 per thousand board feet. Profit from $4.00 to $8.00.

We are willing to send, at our expense, several pieces of 16-ft. long 8-in. lumber joined by our method, in Spruce, to any Lumber Manufacturer in the Dominion to be milled by his usual method, inspected and put to any test as to strength, durability and equality as compared with 8-in. one-piece stock, or we will join up any lumber which we can purchase in our local markets if spruce is not acceptable, or will join free of charge and will stand transportation charges both ways, any lumber which may be sent to us up to 1,000 feet.

A LINDERMAN DOVETAILER installed in your mill should and can save you at least $5,000.00 a year, if not more. We realize thoroughly this is a large figure, but would like the opportunity of putting our proposition before you so that it may be thoroughly considered by you and your assistants.

Maritime Province Consumption of Wood

Detailed Report of Forestry Branch Tells of Totals Used and Varieties Consumed —Waste Product Conversion Extensively Practised

A bulletin upon the wood-using industries of the Maritime Provinces, compiled by R. G. Lewis and W. Guy Boyce, has been issued by the Forestry Branch of the Department of the Interior, as bulletin No. 44. A number of interesting tables and reports upon the use of various kinds of wood are included in the bulletin and a list is also given of commodities manufactured from each kind of wood, as well as a list of the manufacturers of the Maritime Provinces from whom the information in the bulletin was obtained.

To supply the wood-using industries of the Maritime Provinces, at least 200,000,000 feet B.M. of raw material is necessary annually. This total is made up of twenty-eight different kinds of wood, sixteen of which are native to the province. The greatest consumption is of spruce, namely, 116,269,000 feet B.M. or 56.9 per cent. of the total consumption. The consumption of other woods is far less than that of spruce, the next closest being pine, of which the consumption amounts to 24,095,000 feet B.M. The other woods which are consumed extensively include the following:—hard pine, 17,958,000 feet; birch, 13,159,000 feet; balsam fir, 10,273,000 feet; hemlock, 6,032,000 feet; oak, 3,789,000 feet; maple, 3,091,000 feet; poplar, 1,961,000 feet. Douglas fir is used to the extent of about 943,000 feet.

The manufacturers of the Maritime Provinces are proficient in adapting native woods to their own uses, as shown by the fact that only 12.3 per cent. of the wood used is purchased outside of the three provinces.

Building Construction a Large Consumer

The information from which the bulletin was compiled was received from over 600 firms using wood as a raw material. In building construction, the consumption of wood amounted to 60,991,000 feet. This was 30.3 per cent. of the total consumption. The consumption by other important industries was as follows:—wood pulp, 43,331,000 feet or 21.2 per cent.; car construction, 37,275,000 feet or 18.2 per cent.; cooperage, 21,253,000 feet or 10.4 per cent.; boxes and crating, 17,174,000 feet or 8.4 per cent.; hard wood flooring, 5,488,000 feet or 2.7 per cent.; bolts, etc., 4,530,000 feet or 2.2 per cent.; furniture, 4,416,000 feet or 2.2 per cent.

The highest average price paid by industries for their wood was by the sporting goods people, whose material cost them on the average $40.78 per thousand feet. The manufacturers of pulleys and blocks paid $39.96 per thousand feet on the average. Patternmakers paid $30.06. The wood used in the manufacture of boats, etc., cost $28.81 on the average. The cheapest raw material was that used in the production of fruit boxes, which cost $7.42 per thousand feet on the average. Wood pulp manufacturers used wood of an average value of $9.24 per M. feet.

Referring to the boat building industry the bulletin says: "The manufacture of large wooden sailing vessels was at one time among the most important industries in the Maritime Provinces. The introduction of steel and iron boats, and the scarcity of native timber suitable for this purpose, has reduced this industry to seventh place on the list. The industry is now chiefly confined to the manufacture of small boats. Dories, skiffs and small fishing boats form a large proportion of the products manufactured, although some large vessels are still built. A large proportion of the wood goes into repair work on wooden vessels, wooden parts of steel and iron vessels, and all sorts of pleasure craft, such as canoes, rowboats, yachts and motor-boats.

"Nineteen kinds of wood are used in this industry, pine leading with 28.3 per cent. of the total. This wood is used chiefly for hull and deck planking in all sorts of vessels from dories upward. It is also used for interior finish on both wooden and steel boats.

"Pine is valued on account of its lightness, comparative durability, ease of working and the fact that it holds its place with a minimum of expansion and contraction.

"The boat and shipbuilding industry used greater quantities of cedar and tamarack than all the other industries combined. They purchased the most expensive cedar, Douglas fir, hard pine and mahogany, and the cheapest cherry."

In the production of boxes and crating, spruce leads with 11,397,000 feet B.M.

In building construction the most extensively used wood was spruce, the amount being 37,370,000 feet B.M. The average value of all kinds of wood used in building construction was $17.61 per M. feet. The second wood in order according to quantity used in building construction was pine, the total being 14,543,000 feet, which had an average value of $26.23 per M. feet. Referring to the building industry the bulletin says:—

"In almost every study made of wood-using industries, building construction leads the list for quantity of material used. While brick, stone, steel and concrete are supplanting wood as a structural material to an enormous extent, still the use of wood tends to increase for this purpose, especially in rough temporary structures. Even the most modern fire-proof buildings of steel, concrete and tile have wooden floors, wooden doors encased in metal, and interior finish of wood.

"Twenty-eight different kinds of wood are used, in quantity, by the wood-using industries of the Maritime Provinces, and, of these, twenty-three are used in building construction—a greater number than is used by any other industry.

"Many of the larger firms saw their material from the log and have a planing mill and builders' factory in connection with their sawmill. Others buy lumber and work it into shape for building material. These manufacturers use chiefly native material. Hard pine, cypress, basswood, tulip and Douglas fir form the bulk of the imports, together with smaller quantities of the more expensive decorative hardwoods such as oak, chestnut, mahogany, walnut and cherry. Altogether, only a trifle over three per cent. of the wood used is purchased outside the provinces.

"This industry uses more pine, hemlock and cypress than all the other industries combined, and takes all the butternut used. Manufacturers of pulp alone use more spruce than this industry. On the list of six other woods—Douglas fir, cedar, chestnut, mahogany, tamarack and walnut—this industry also comes second."

Railroad Cars Use Large Quantities

Sixteen kinds of wood are used in the production of railroad cars, a large percentage being hardwoods. Hard pine heads the list with over 17,000,000 feet B.M. or 46.3 per cent. of the total. This industry used practically all (96.1 per cent.) of the hard pine imported into the province.

Spruce forms over a quarter of the total wood consumed in car construction, and is used in freight cars as flooring, sidings and lining and also for the wooden parts of locomotives.

In the production of coffins, caskets, and shells, the Maritime Provinces consumed 1,176,000 feet B.M., of which the average cost was $21.16 per M. feet B.M. The preference of the people of the Maritime Provinces was apparently for pine coffins, as the quantity of this class accounted for the consumption of 680,000 feet B.M. or 57.8 per cent. of the total. The most expensive wood used in the production of coffins was oak, of which 2,000 feet was used, the average value being $50 per M. feet.

The manufacture of barrel stock is the fourth most important industry in the Maritime Provinces. In 1912 the production included the following:—slack staves, 39,939,000; slack heading, 2,746,662 sets; slack hoops 6,227,900; tight staves, sawn, 1,389,083; tight staves, bucked and split, 12,000; tight heading, sawn, 177,113 sets. The average value of cooperage wood was $18.71 per M. feet B.M., and the total quantity used was 21,253,000 feet B.M., of which 78.3 per cent. or 16,644,000 feet B.M. was spruce.

In the production of furniture the quantity of wood used was 4,416,000 feet B.M., of which the average value was $19.60 per M. Over 46 per cent. of this was birch, which was used to the extent of 2,032,000 feet.

In hardwood flooring, 5,488,000 feet of wood was used, the average value being $17.66. Over 60 per cent. of the hardwood flooring was birch, nearly 25 per cent. maple, 14 per cent. beech, and 0.7 per cent. oak.

Consumption of Wood for Pulp

In the production of wood pulp the following quantities were used:—spruce, 38,318,000 feet B.M.; balsam fir, 4,462,000 feet B.M.; hemlock, 499,000 feet B.M.; poplar, 30,000 feet B.M.

Referring to the wood pulp industry, the bulletin says:—

"Seven mills in Nova Scotia and four in New Brunswick in 1912 consumed 78,217 cords of raw material, valued at an average of $5.12 a cord. In addition to this, a total of 156,674 cords were exported from these two provinces in the unmanufactured form. This means that out of a total of 234,891 cords of pulpwood produced in the Maritime Provinces, only one-third is manufactured into pulp in the mills of the region, and a quantity of raw pulpwood is exported sufficient to supply at least twenty mills of the same average size as those in Nova Scotia and New Brunswick.

"This exported pulpwood is usually 'rossed' or barked before being shipped, but is otherwise in the unmanufactured state.

"A total of 55,701 tons of pulp is produced annually. Of this

33,186 tons is ground wood or mechanical pulp; 18,515 tons is sulphite pulp and 4,000 tons is soda pulp.

"There are only five kinds of wood used for pulp manufacture, and of these spruce forms a greater part, as it does in most regions where pulp is produced.

"In the Maritime Provinces ground wood or mechanical pulp is made of spruce, balsam fir, hemlock, poplar and pine. Sulphite pulp is made from spruce and balsam fir only. Soda pulp is made entirely of spruce.

"The wood is purchased in the round, cut in four-foot lengths and is measured by the cord. The material is all native. This industry uses more spruce and balsam fir than any other industry. The average price paid for raw material is below the general average and lower than any other industry except the manufacture of fruit baskets. The prices paid for balsam fir and pine are the lowest reported."

Economical Use of By-Products

An interesting section of the report deals with the production of by-products from wood, in the following manner:—"The economical use of wood by any wood-using industry should include the close utilization of small pieces or pieces of odd dimensions which cannot be used in the main products of the industry. This is often called 'waste utilization,' but such material should no more be considered as waste than coal tar as waste in gas manufacture. In many industries the by-products are an important source of profit, and should be also in wood-using industries.

"It often occurs that one manufacturer is burning material under his boilers which another manufacturer could use as the raw material for his industry. The Forestry Branch has been instrumental in bringing many such firms into communication with each other. This, however, is unusual, especially with raw material at the low prices which now prevail. Manufacturers of brush-backs, for instance, in most cases find it more profitable to purchase rough lumber and cut this to the required size than to purchase waste from vehicle, furniture and builders' factories and to sort this out and select the material they could utilize. This is specially true with the larger firms who handle thousands of feet of lumber in a year. With smaller firms it is often profitable to buy waste from other factories, and the Forestry Branch is prepared to give this interchange of material every assistance possible. Many enquiries are received from firms with waste to sell of certain sizes and many also from firms who wish to buy material of certain sizes, and whenever advisable, buyers and sellers are put into communication with each other.

"The greatest saving of raw material and the greatest increase in profit is obtained when a manufacturer makes a study of the uses of wood and in his own factory manufactures by-products of saleable value. Not many years ago most factories purchased their lumber from the sawmills and manufactured boxes from this. At the present time almost every large sawmill has a box factory in connection with it, and this industry by itself is a source of profit as well as a means of utilizing much of the rough lumber which would otherwise go to the waste-burner.

"This saving can be carried into greater detail with equally satisfactory results where more expensive wood is used in manufacturing more complicated products.

"The following list of uses for wood-waste is the result of reports received from wood-using industries in the Maritime Provinces and in Ontario.

"Sash and door factories sell or use their short ends and trimmings for the manufacture of apple, fish and other boxes, bathroom fittings, baskets, bobbins, brush-blocks, butter-moulds, dowels, fire-work-woods, heading, game-boards, insulator pins, ladder rounds, letters for signs, lobster pots, match-blocks, novelties, skewers, spindles, spools, stakes, tool-handles and woodenware. They bale their common sawdust and sell it to butchers for floor covering, to manufacturers of composition novelties, and to screw factories for cleaning screws. They sell shavings for bedding, packing and for drying wet land. Hardwood sawdust is sold for smoking meats. Small waste pieces are sold for making ground wood pulp, wood fibre for plaster work, and as a substitute for gravel in concrete masses.

"Furniture factories utilize waste in the manufacture of boxes, brush-backs, crates, dowels for export, inkstands, jardiniere stands, waste paper baskets, rosettes, stools, tabourets and toys, and utilize cuttings of quartered oak and mahogany for wood carvings.

"Boat and ship building firms reported the use of their small waste in the manufacture of boxes, boiler blocking, crates, ladder pickets, plugs, surveyors' stakes, skids, skis, toboggans, tent-pegs, wedges, and whiffle-trees. They sold shavings and sawdust for bedding.

"Manufacturers of vehicles utilized their waste chiefly in the manufacture of handles for small tools, such as chisels, files, hammers, or gimlets, and also for the manufacture of dowels, furniture squares, ladder rungs, pump handles and wheelbarrows.

"Agricultural implement makers also have a good opportunity for manufacturing tool handles, which many of them take advantage of. They also utilize waste in the manufacture of washing machine parts and sell sawdust for concrete mixing.

"Box and crate manufacturers use their material down to very small cuttings, and consequently have little useful material left. They make butts of hard maple logs into meat blocks and manufacture some small handles and mouldings and sell their shavings for bedding.

"Manufacturers of store and office fixtures make staffs for railway flags and use basswood in making mail boxes.

"Foundry men and heavy machine manufacturers utilize their waste in making battery boxes, skids, crates, pulleys and small parts of patterns, and sell shavings for bedding.

"Novelty makers use small pieces of waste in the manufacture of 'producer gas.' They sell common sawdust for making pincushion frames, hardwood sawdust for smoking meats, and pine and cedar sawdust for metal polish.

"Sporting goods manufacturers reported using waste for spindles, blind roller parts, brush blocks and pail handles.

"While sawdust is usually considered as more of a nuisance than a commercial product, it can be utilized for some purposes, depending chiefly on the proximity of the market. A number of methods of chemical utilization of sawdust have been experimented on in the past with varying results. A large lumber concern in British Columbia is erecting a $50,000 plant for the manufacture of sawdust into briquettes for fuel. This plant will have an output of thirty tons of briquettes a day, which will sell for about five dollars a ton at the mill."

An Effective Rat and Mouse Catcher

An interesting advertisement of a very effective rat and mouse catcher, invented and manufactured by H. D. Swarts, Scranton, Pa., appears in this issue, to which we wish to draw the attention of our readers. The rat and mouse catcher is a most ingenious arrangement, which, its inventor claims, will clean a building of rats and mice in a short time, and keep it clean, as it is always ready for use. It is made of galvanized iron, cannot get out of order and lasts for years. A large number can be caught daily for the device on the inside resets itself after each rat or mouse passes it. It is only necessary in the mornings to remove the device from the inside, take out the dead rats and mice, and replace it. Two small pieces of cheese are used as bait, thus doing away entirely with poison. The catcher is 18 inches high and 10 inches in diameter. A catcher 8 inches high for mice only is also manufactured.

Every lumber mill and yard keeps a large number of horses and the owners seldom realize the amount of worthless feed their animals

eat on account of the rats and mice having eaten the heart out of the corn and the meat out of the oats. The efficiency of these traps is so great, the inventor claims, that there will be no more loss of feed in this manner, once the trap has been set. One large trap is reported to have caught over 500 rats in three months in one establishment. Readers who are interested may secure further information, prices, etc., by writing to Mr. H. D. Swarts, P. O. Box 566, Scranton, Pa.

Prince Rupert Buys Morris Overhead Crane

An order has just been received by the Herbert Morris Crane & Hoist Company, Limited, through their agents in Vancouver, Messrs. Waddy & Young, for a 10-ton hand operated overhead traveling crane, fitted with Morris Roller Bearings to the main traveling motion. This order was placed by the City Engineer of Prince Rupert after considering quotations from all the leading North American makers of cranes. The new power house is well under way and is expected to be in full operation before the fall.

Harris-Hayes Company in New Quarters

The Harris-Hayes Lumber Company, wholesale dealers in southern stocks, specializing in piling, have opened offices in the Ryrie Building, Toronto. Mr. Harris has had many years' experience in the lumber business in the southern States, and came to Toronto from St. Louis, while Mr. Hayes is a native of Ontario.

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

The Galt Knife Company, Limited

Ward Vair, Galt Ont., Man. Dir.

The new plant of the Galt Knife Company, Limited, Galt, Ont., manufacturers of machine knives, is now in operation, and the company report that they have a large number of orders ahead, on the books, and also that their prospects for future business are most encouraging. Mr. Thomas Vair, president of the Galt Knife Company is well known as the former manager of the Peter Hay Knife Company. Mr. Ward Vair, managing director, whose portrait is published herewith, was formerly superintendent of the Peter Hay Knife Company. The new plant of the Galt Knife Company, Limited, is located on a splendid factory site in the southern part of the town of Galt on the east side of the Grand Trunk tracks and also adjoining the new line of the Lake Erie and Northern Railway. The building is of handsome appearance, its size being 40 ft. x 140 ft. The foundations are concrete and the building is of red pressed brick piers, with steel sash used throughout, giving splendid light and ventilation. Georgia pine has been used in the construction of the building, with the exception of the office, which is finished in cypress. The building is of slow-burning mill construction.

The equipment in all the departments is of the most modern description, quite a number of the furnaces and grinding machines having been built from special designs, worked out by the company, which are said to be the last word in the heat treatment and manufacture of steels for the various requirements of woodworking industries and pulp and paper mills.

The Galt Knife Company, Limited, are also manufacturing a complete line of metal-cutting shear blades used by structural steel plants, boiler shops, stove foundries, etc. The plant is now equipped to handle blades of this description up to 120-in. long.

An Important New Defiance Machine

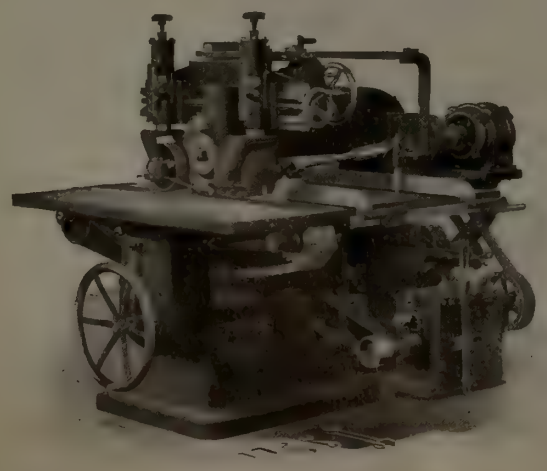
Experienced woodworkers agree that a sawing machine that will cut an absolutely straight edge; make an accurate glue joint and do ordinary ripping, in either hard or soft wood, at any desired capacity from 35 to 155 feet per minute, is "a consummation devoutly to be wished."

Such a machine, complete in every detail, has recently been placed on the market by The Defiance Machine Works, of Defiance, Ohio, U.S.A. It is known as the No. 121 Patent Chain Feed Straight Edger and Rip Saw, and is illustrated in the accompanying engraving.

This over-hung or top-cutting saw is a new departure from the accustomed methods of sawing and was evolved from successful experiments in making glue joints direct from the saw. Although a new machine, its success is assured, for, already, there are some fifty of them in daily use both in America and Europe, and in a wide variety of establishments, including spoke, wheel, wagon, carriage and automobile factories; body and furniture factories; agricultural implement, interior finish, sash and door plants; piano and organ manufactories, etc.

The machine will handle material of any length from 14-in. and up, to 3¾-in. in thickness by 32-in. wide, and with special saw collars will rip stock 4-in. thick. A special attachment is supplied, when required, for sawing extremely short stock. The table is 53½-in. x 56-in., is fitted with a brass scale, graduated in inches or centimeters, as required; has both a short and long friction gauge, and an adjustable sighting device. The machine has six changes of feed, viz., 35, 50, 65, 80, 105 and 155 feet per minute. The feed rolls as well as the patent feeding chain are power driven, having a positive movement without any jerking or vibration.

The feeding chain used on this machine consists of 32 self-lubricating links, each containing an oil reservoir. Its operation is equivalent to a rack and pinion movement. The top surface of the chain is checkered and is provided with a slot to accommodate the saw. The machine can be supplied for direct motor drive, or, to be driven from a counter. Counters for basement, floor or ceiling are furnished, as required. Additional information with reference to this, or any other Defiance machine will gladly be given, upon application to The Defiance Machine Works, Defiance, Ohio, U.S.A., or their agents.



No. 121 Defiance Patent Chain Feed Straight Edger aud Rip Saw

A Revolution in Lumber Stacking

The machine shown in the accompanying illustration is or should be interesting to all lumbermen whether they be manufacturers or dealers. It is the invention of Henry C. Hilke, General Superintendent of the Seattle Cedar Lumber Manufacturing Company of Seattle, Washington, and was patented by him in the United States and Canade. Like practically all other useful mechanical appliances its invention was a result of necessity and the primary idea was to obtain a

D. C. CAMERON, President and General Manager.

means of cheaply piling lumber high. This necessity existed because of comparatively limited space upon which to carry a huge stock of air-drying cedar lumber.

At first glance it is really difficult to grasp the far reaching possibilities of Mr. Hilke's invention and it is doubtful if, even he clearly foresaw its entire effect upon yard economy until after he had constructed and placed in operation his first working piler.

The fact that the machine will save at least one half the cost of piling and unpiling lumber, as against the old and universally prevailing methods, is interesting and attractive, but it is doubtful if the sum of this saving, handsome as it is, will even approximately approach the total annual sum to the machine's credit, through cost reduction of team mileage, alley mileage, pile bases, pile roofing, etc.

The illustration exhibits the manner in which lumber is handled by the machine so clearly, that further description seems unnecessary, but it may be well to say that the lumber to be piled is lifted into the spaced carriers at the bottom and these convey the material over the top and down into the hands of the pilers who usually remove one end of a heavy plank or timber at a point well above the waist line swinging it around into piling position while permitting the carrier to support the other end.

By the time this is done the supporting carrier is low enough to permit removal well below the waist line and yet high enough to prevent stooping or straining on the part of the workman. The chains travel thirty or thirty-three and half feet per minute and deliver all sizes of lumber from 1-in x 4-in. to 4-in. x 24-in. at the rate of from 7,000 ft. to 20,000 ft. per hour.

A proof of the machine's efficiency is found in the fact that two good lumber pilers will remove 1-in. x 12-in. x 16-ft. or 2-in. x 12-in. x 16-ft. from the carriers and pile it accurately at the rate of 20,000 feet per hour, and do the work with ease and without hurry or any form of over exertion.

The machine is built to work on track, planked alleys, macadam, dirt or sawdust alleyways. It operates by electricity and the system of yard wiring recommended by the manufacturers is not only simple but surprisingly cheap. When operating on track, planked or macadam roads the machine is pulled around by the men who work it, but when working on dirt or sawdust roadways it is pulled around by a horse. These machines are built for piling lumber of any size or length and in addition to the standard line of lumber pilers the manufacturers are now bringing out a full line of timber pilers, car loaders and unloaders and special machines for elevating bar iron to any height desired.

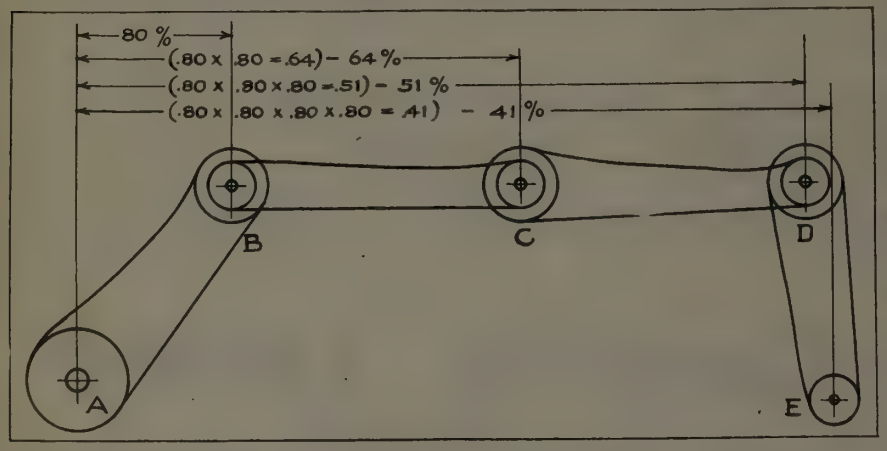
Catalogues can be obtained by writing to the manufacturers, The Hilke Stacker Company, No. 1 Broadway, New York City, N.Y.

Efficiency of Machine Drives

SPECIALLY CONTRIBUTED FOR THE CANADA LUMBERMAN—BY N. G. NEAR

The average man does not like to be bothered with small technicalities—little details. Wherever there is a small power loss he is prone to let it go and argue within himself that "it is too small to bother with." Such is usually the case with belt transmission, but I wish to show here that in many cases the apparently small losses in belt transmission amount to a whole lot in the end.

Take, for instance, such an arrangement as shown herewith, where A is the flywheel of an engine, B a main line shaft, C a secondary line shaft, D a countershaft and E the final driven machine. You no doubt know that a great deal of the power starting at A will be lost before



it gets through this mass of belting and shafting, but, where the efficiency of belt transmission is as high as 80 per cent. between each pair of shafts, it is a fact that only 41 per cent. of the power would come out at E provided all of the power were dispersed through four transmissions as drawn; and, this is not an extreme case. I have seen it time and again. The way we arrive at the overall efficiency is by multiplying 80 per cent. by itself four times, thus:

$$.80 \times .80 \times .80 \times .80 = .41$$

Now, to show the advantage of higher transmission efficiency as by the use of ball bearings, about which I wrote in the June 1st issue of the Canada Lumberman, let us assume a higher transmission efficiency, say, 90 per cent., which is a very conservative figure. We would then have:

$$.90 \times .90 \times .90 \times x.90 = .65$$

If there should be five pairs of shafts instead of four we would get the overall efficiency by multiplying 90 by itself five times; if six pairs, 6 times, etc. Anyway, we find that in this specific instance, with 90 per cent. efficiency instead of 80 per cent., a total of (.65 — .41 = .24) 24 per cent. of the engine power would be saved. At the low rate of one cent per horse power per hour, the saving effected by installing ball bearings and increasing the efficiency of each couple 10 per cent. would amount to $576 per year.

According to some recent tests made by Carl C. Thomas, Professor of Mechanical Engineering at John Hopkins University, there is a great difference in efficiency between plain bearings and ball bearings. He shows that where a temperature of 77 degrees F. is maintained, a plain babbitted bearing consumes from 3 to 4.5 times as much power as a ball bearing under the same conditions, the peripheral speed of the shaft in each instance ranging from 100 ft. per minute to 300 ft. per minute. Where a temperature of 100 degrees F. is maintained a plain bearing consumes from 3.6 to 4 times as much power as a ball bearing. These facts then show very clearly why it is often possible to make a once overloaded engine or motor pull more machines after installing ball bearings as in my June article.

Up to the present time there has been much discussion in technical papers concerning the advantages of direct motor drive over belted drive such as shown in the illustration. There is no doubt that direct drive has many advantages still, in the way of simplicity, neatness, continuity of service, etc., but there has been no appreciable increase in efficiency in motors in recent years, whereas with the advent of ball bearings in transmission service there has been a decided increase in efficiency. It is therefore difficult to state, off hand, which is preferable. Even with plain bearings, belt drive is often preferable and therefore, with ball bearings, belt drive would be even more preferable.

Before installing machinery of this kind, where either belted or direct drive may be used, it is best to give the matter pretty serious consideration. Look at it from every angle. Sometimes, where a certain machine is seldom used, and where it and its belted connections can be cut off by use of a clutch, or by simply throwing off the belt, it is most economical to use plain bearings. First cost would prohibit the use of the more expensive modern kind. Again, where one machine consumes considerable power it is advisable to use direct drive, but in the average woodworking plant where each machine consumes comparatively little power, belted drive with low friction bearings are still most economical.

Above all, if there is any doubt in your mind as to the best kind of drive, do not hesitate to pester the manufacturer with questions. Manufacturers usually enjoy answering questions, especially where prospective sales are in sight, and you can rest assured that a good, old, responsible firm will give you the right answer. When writing to manufacturers give them as much data as you have to submit. The more they know about your conditions the more accurate will be the answer.

C.P.R. Increasing Their Fire Protection Staff

The C. P. R. forestry branch are adding to their staff of fire inspectors. Three men have been assigned to the lines in British Columbia, and three additional men to the lines in Ontario, Quebec, Maine and New Brunswick. The men of the forest fire prevention branch of the company, in addition to collecting information to be used in fire claim cases, help to prevent the occurrence and the spread of fire by personally meeting sectionmen and other employees of the company, thus ensuring that the men are fully informed regarding the very strict instructions issued by the general manager relative to the reporting and extinguishing, by railway employees, of fires occuring along the right of way.

Camp Supplies

Evaporated apples are scarce and high and in their place we are offering a line of California Evaporated Peaches. This fruit is bright quality, a quite good grade being what is called Orchard run, consisting of Fancy Choice and some Standard.

They are packed in 50 lb. boxes and are an excellant substitute for apples. In the camps where they have been used the men like them much better than apples,—and then the price is so much lower, only seven and a quarter cents.

Let us send you a sample lot

H. P. Eckardt & Co.

Church St. & Esplanade :-: TORONTO

A Lumber Piling and Unpiling Machine

A Hilke 30 ft. PILER working in the yard of the Shevlin-Clarke Co., Limited, Fort Francis, Ontario.

This machine will pay for itself from one to six times per annum, all depending on the scope of its opportunities.

It reduces by half your cost of piling and unpiling lumber.

It saves half your cost of alley floors or roads.

It reduces by half your number of pile bases.

It cuts squarely in two your costs of roofing lumber.

It saves just half your yard space and this always means much even where land is very cheap, because it costs money and lots of it to haul lumber round a yard.

It takes lumber down from high or low piles with perfect freedom from breakage or injury.

It sets the pace for your men and helps them do much work with little labor.

It is as mobile as the men who operate it and when placed in front of a pile is instantly ready for work.

It removes at once and forever the need of using elevated tramways with their great first cost, impaired circulation and imperfect drying below their surface.

It is a maker for efficiency because it is itself so efficient that it naturally turns your mind toward other yard economies of which there are usually many never before observed.

Patented in the United States and Canada by H. C. Hilke.

WHY you should install the

Mahony Blower

System in your Planing Mill

Fifty per cent. higher efficiency than any other on the market to-day, uses ¼ less power, costs less to install, no cyclone required, eliminates back pressure on the fan.

I will undertake to increase the capacity of any system now installed 50 to 100% by the application of the Mahony Back Pressure valve on your fan, without using a scrap more of horse power.

YOU NEED this apparatus in your plant

Write to-day for prices

A. Mahony, 512 Wellington West, Toronto

Timber Concessions in the Province of Quebec

Notice is given by the government of the Province of Quebec that, on the 11th of August and on the 20th of October, 1914, permits to cut timber on over 8,000 square miles of Crown Lands will be offered at public auction.

The territory to be disposed of comprises some 1,200 square miles in the basins of rivers Ottawa, Harricana and Bell, in the Abitibi region ; 6,000 square miles in the Lake St. John northern region ; 350 square miles in the Lake St. John East agency ; 242 square miles in the Matapedia division.

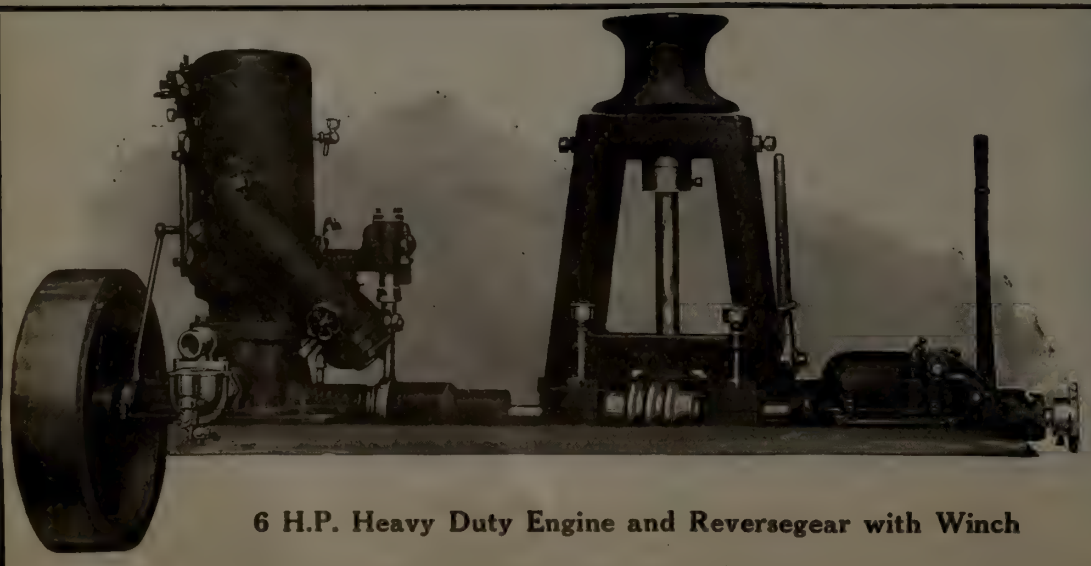
On the first date above mentioned, permits will be offered at ordinary conditions on some 3,000 square miles.

The timber grants advertised for the 20th of October, comprising the basins of three large rivers in the Lake St. John region with considerable water powers, will be subject to the obligation of manufacturing the wood into pulp or paper within the Province of Quebec.

For particulars, please apply to the Department of Lands and Forests, Quebec, Canada.

Elz. Uiville Dechene,
Deputy Minister of Lands & Forests.

Quebec, 11th April, 1914.



6 H.P. Heavy Duty Engine and Reversegear with Winch

River Driving Costs

will be decidedly lower this year if you use Adams Gasoline Towing Machinery in 25 ft. punts for carrying supplies and handling booms and logs. One man does the work of ten. We have both machinery and complete punts for prompt shipment. It will pay you to write us now. Gasoline engines all sizes, 2 to 25 h.p.

If You Use Cross-Cut Saws You Should Have This Book

It contains valuable information on the "fitting" of Cross-cut Saws, shows the action of the Raker Tooth and explains how it leads to faster cutting. It also illustrates and describes the different popular types of Disston Cross-cut Saws.

It will aid you in selecting the proper style of tooth and saw for your particular work, for there is a Disston Cross-cut Saw to meet every condition. After reading this book you can better understand why Disston Saws are found in most of the lumber camps of the world and why they

Run Easiest, Cut Fastest and Last Longest.

Knight

Pony Lath Mill

This mill is built for use with a 10 to 15 horse power engine and as single mill only. It is specially suited to the requirements of thresher and saw mill men operating in small tracts of timber, as both husk and carriage are of a size which will permit of easy loading between the standards of a wagon when moving from one setting to another.

Write for the catalogue of the Knight line of saw mill machinery.

Size "S" Single Mill with 16-foot Carriage

Size Husk ... ... 3 feet by 6 feet 3 inches	Width of Carriages ... ... 33 inches
Diameter and Length Mandrel . 2 3/16 by 55 inches	Trucks ... ... 7-inch wheels and 1¼-inch axles
Size Drive Pulley ... ... 20 by 10 inches	Length Track ... ... 32, 40, 48 or 56 feet
Feed per Revolution of Saw ... ... 0 to 3¼ inches	Style and Opening of Blocks ... ... Cl-36 inches
Feed Belt ... ... 4-inch Gandy	Style Mill Dogs ... ... Pony Excelsior
Largest Diameter Saw ... ... 56 inches	Style Set Works ... ... No. 1 Single Ratchet
Length of Carriages ... ... 12, 16, 20 or 24 feet	

With each complete size "S" mill we furnish one saw, wrench, cant hook, feed belt, pulley with boxes for tightener and foundation bolts for husk.

EDGINGS

Ontario

Campbell Brothers' sawmill, at Spencerville, Ont., was recently destroyed by fire, the loss amounting to $12,000.

The sawmill belonging to Jas. Cluffe, at Maxville, Ont., was recently destroyed by fire. There was no insurance.

The plant of the Consumers Lumber & Box Company, Grimsby, Ont., was recently destroyed by fire. The loss amounted to $25,000, and there was insurance to the amount of $12,000.

The Carlton Construction Company, Limited, Union Bank Building, Ottawa, Ont., are reported to be in the market for about 130,000 feet, B.M., of 6 x 8 in. to 12 x 26 ft., square timber.

Work in connection with the new woodworking factory of J. R. Eaton & Sons, Limited, Orillia, Ont., is progressing satisfactorily. The plant will cost $100,000. The foundations are already in.

The Oakville Basket & Veneer Company, Limited, has been incorporated with head office at Oakville and capital stock of $100,000. Those interested include J. M. Bullen, F. H. Hurley and R. G. Agnew.

Fire, starting from some unknown cause wiped out the East End stave mill at Strathroy, Ont., recently. The property is owned by James P. Pogue. It is believed the loss will amount to ten or twelve thousand dollars.

A fire occurred recently at Mr. Manley Chew's lumber yard, Midland, Ont. The loss amounting to $200,000. The principal losers were the H. H. Hettler Lumber Company, the owners of the mill, Mr. D. S. Pratt and Mr. J. G. Cane, Toronto, also the Georgian Bay Shook Mills.

The Wallaceburg Lumber Company, Limited, Wallaceburg, Ont., has been incorporated with capital stock of $40,000. Among those interested in the company are D. A. Gordon and D. G. Gordon, Wallaceburg, Ont. The company are given the power to build saw and planing mills and conduct a general lumber business.

J. R. Booth, Ottawa, Ont., has commenced construction work upon a new sulphite mill, to cost $35,000. The building will be two storeys, 98 x 50 ft., of reinforced concrete construction. Mr. Booth has also commenced the erection of a timber mill to cost $20,000, which will be one storey, 150 x 45 ft., of reinforced concrete.

The Riordon Pulp and Paper Company have made some extensive alterations at their sulphite mill at Merriton. The main building has been overhauled and the machinery has also been improved, additional screens having been installed. These alterations will increase the output capacity about 10 per cent. At Hawkesbury, the company have put up a new building, and installed another drying machine, thereby increasing the general production of the mill, which will have an output of just over 150 tons per day, while at Merriton the output is about 30 tons per day.

The S. E. Carss Lumber Company, Limited, Orillia, Ont., whose planing mill was destroyed by fire on May 30th, report that the destruction of the mill was complete, and the loss amounted to about $25,000, on which there was insurance for $11,000. The cause of the fire is not known. The company intend to build a modern mill during the present summer. The mill which was destroyed was used entirely for planing, resawing, etc., in transit. The company report that, had it not been that the wind was blowing from the west and a heavy rain falling, all the lumber in the yards and storage sheds, which extend for two blocks south of the mill, would also have been burned.

Eastern Canada

D. H. Pennington, Lyster, P.Q., has sold his saw mill to the Quebec & St. Maurice Industrial Company.

The new Price saw mills, employing 150 men, were opened at St. Gedeon, Lake St. Johns, P.Q., on June 18th.

The Chaleurs Bay Pulp & Paper Company has been incorporated with head office at Sherbrooke, P.Q., and capital stock of $100,000.

The Belgo-Canadian Pulp & Paper Company, Limited, Shawinigan Falls, P.Q., have awarded a contract for an extension to their paper mill.

Fire at Riversdale, Lunnenburg County, N.S., recently destroyed 300,000 feet of lumber, belonging to Nathan Veinot, mill owner and lumberman of that village. At one time the conflagration threatened the village.

Colin McKenzie, Victoria, Cumberland County, N.S., reports that the recent report to the effect that his portable sawmill had been destroyed by fire, was

incorrect. A large number of willing hands saved the mill from destruction by moving it out of the woods before the fire reached it.

Fred Demers and Company, Montreal, sash and door manufacturers, lumber dealers, etc., have been registered. The partners are F. Demers and J. H. A. Bohemier.

The sash and door factory of Jasmin and Cantin, Cartierville, P.Q., has been burned to the ground, the damage to buildings and machinery being estimated at $20,000. The insurance was $5,000. The factory will be rebuilt at once.

The factory of Paul Beaudry, balcony and stair manufacturer, Davidson Street, Montreal, has been destroyed by fire. In addition to the mill buildings and machinery many thousand feet of lumber were burned. The loss is estimated at $60,000.

R. & T. Ritchie, Aylmer, P.Q., who recently lost their sawmill by fire, have commenced work upon the erection of a new mill which will cost $30,000. The building will have a concrete foundation and will be of frame and brick veneer construction. Corrugated iron roofing will be used. The plant will be electrically lighted. The company will be in the market for woodworking machinery.

Chappell Bros., have disposed of their large lumber areas in Quebec to a Boston company formed under the name of the Nouvelle Lumber Company. The timber lands, which comprise some 113,000 acres, were acquired by Chappell Bros. three years ago, and were operated by them exclusively since then. The chance was offered this spring to dispose of the timber tracts on favorable terms, and the final transfer was made during Mr. R. R. Chappell's recent visit to Boston. The capitalization of the new company is placed at $500,000 preferred and $1,000,000 common stock.

Western Canada

The Acorn Lumber Company, Edmonds, B.C., are preparing plans for a new dry kiln and an addition to their sawmill.

The Regina Sash & Door Company, Limited, has been incorporated with head office at Regina and capital stock of $20,000.

The Barclay Shingle Mills Limited, have been incorporated with head office at Vancouver, B.C., and capital stock of $25,000.

The Valley Lumber Company, Limited, has been incorporated with head office at Vancouver, B.C., and capital stock of $50,000.

The H. J. Wells Lumber Company, Limited, has been incorporated with head office at Edmonton, Alta., and capital stock of $50,000.

The E. W. Whittington Lumber Company, Limited, has been incorporated with head office at Victoria, B.C., and capital stock of $75,000.

The North Burnaby Lumber Company, who operate near Burnaby Lake, B.C., will erect a new plant with a capacity of about 40,000 feet per day.

T. M. Michaels, Seattle, Wash., recently paid a visit to Prince Rupert, B.C. Mr. Michaels is considering a proposition for the erection of a mill and box factory at Prince Rupert.

The Guildford Island Lumber Company has been registered as an extra-provincial company to carry on business in British Columbia. The Provincial head office is at Vancouver and the home office is in Wilmington, Del.

The Sprague Lumber Company, Limited, Winnipeg, Man., has been incorporated to take over the business of D. E. Sprague. The capital is $2,000,000 and the directors are H. C. H. Sprague, H. D. Sinclair, D. D. Sprague, H. H. Dunwoody and A. C. Ferguson.

Over 115 square miles of timber limits along Seymour Inlet, B.C., and adjacent waters, containing over three billion feet of high grade cedar are being transferred to a syndicate of California and Denver capitalists, for $3,000,000, by W. M. Gilfoy of Calgary and his associates. It is reported that the new owners will begin logging operations at once and that they are planning to erect several mills.

J. S. Deschamps, Ex-Mayor of Rossland, B.C., intends to build a sawmill in the city of Nelson of about the same capacity as the mill he is now operating at China Creek. This has a capacity of 40,000 feet and employs about sixty men. While in Nelson a few days ago, Mr. Deschamps met W. A. Anstie, general manager of the Forest Mills Lumber Company, and made arrangements for securing the old mill site of the Yale-Columbia Lumber Company, which was burned out a few years ago. Three million feet of logs, now waiting there to be sawn, also figured in the deal and this will be the first supply for Mr. Deschamps' new mill. Building operations will be begun right away so that the mill can be ready for business at the beginning of the season. In addition to the three million feet of logs mentioned, several million feet are cut along Kootenay Lake and Mr. Deschamps expects to secure these. He has quantities of standing timber in the vicinity and will feed the mill from Kootenay Lake.

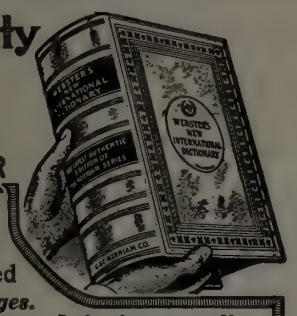
The Supreme Authority

WEBSTER'S NEW INTERNATIONAL DICTIONARY - THE MERRIAM WEBSTER



YOU Need It—BECAUSE

It defines over *400,000 Words;* more than ever before appeared between two covers. *2700 Pages. 6000 Illustrations. Cost $400,000.* It is the *only* dictionary with the new divided page. A "Stroke of Genius." It covers every field of thought, action, and culture; an encyclopedia in a single book. Type matter equivalent to that of a 15 volume set.

TO KNOW means to WIN SUCCESS. Let us tell you about this supreme authority for all who use English.

WRITE for specimens of the new divided page, illustrations, etc. Mention this publication and receive FREE a set of pocket maps.

G. & C. MERRIAM CO., Springfield, Mass.

The Busy Signal

If **you come** to us in quest of timber **now** you will not get that distressing "busy signal."

If you delay we cannot guarantee what the response will be. You will have our attention as a matter of course, but we may be compelled to advise that our present line of bargains is busy.

That will mean that someone else will have taken advantage of the opportunity which today you should turn to your advantage.

Today the Opportunity is yours, without lot or hindrance. If you want to improve it write immediately to

Save All The Hand Fitting!

Use Shimer Cutter Heads in which the Bits are simply filed or ground to sharpen and set to a gauge—no more trouble than filing a saw. They eliminate hand fitting and make the men and machines so efficient that a quality product can be turned out in paying quantities. **They save time, save labor, save material**—do away with the fitting, trying and other annoyances, and cut so easily and clean that power is also saved. **They maintain uniform patterns** because the shape of the pattern is turned into the long-life Circular Bits and never changes when the Bits are sharpened.

Shimer Cutter Heads are provided with the latest developments in the art of reducing friction and wear on the knives. The Bits are bolted to Conical Duplex Bit Seats to secure perfect point and edge clearance. Working in pairs and in upper and lower series upon the Head, they divide the cut in a shearing manner, lessening the tendency to pull out knots and splinters on hard and cross-grained lumber.

The "Shimer Limited" Cutter Heads, with Expansion, Fig. 627 and Fig 628 FOR THE HIGH SPEED MATCHER

These Heads have a chucking device which self-centers them on the spindle and grips firmly thereto when the device is drawn up, overcoming the abjectionable set screw as a means of fastening the Head to the spindle. It is reliable and practically perfect in results.

The Bits carry a larger areal surface and the Bit chambers are of greater depth to compensate for the new chisel point given to the Bits for greater relief to the parts coming into contact with the lumber.

They are simple and strong throughout, have no delicate parts to break down or get out of order, and are safe and efficient tools for matching flooring, etc., at high speeds.

Price, net, for Flooring, $72.46 the set complete.

The edge outline of the Bit only comes in contact with the lumber and shapes it accurately. As the cutters are filed or ground to shape on the inside of the circle the shape never changes. All that portion of the cutting edge is brought into service as the cutter is sharpened and brought around upon its holding bolt to again fit the gauge.

There's a Shimer Cutter Head for every kind of matching and moulding service. If you will state your conditions and give us measurements of your machine we will send you the proper tools on free trial. Write us today.

Educational Talks on Leather Belting.

Proper Selection of Belting
(Widths, Weight and Quality)

The use of belting constructed to meet each condition of service insures low cost of operation and maintenance as well as the maximum production from machinery.

A belt should be capable of transmitting from 5 per cent to 25 per cent more power than is actually needed ; the excess capacity being governed by the type of drive, ranging from 5 per cent for heavy main drives to 25 per cent for machine belts.

Too Wide vs. Too Narrow Belting.

Never use belts full width of the pulley face as a slight misalignment may cause part of the belt to run beyond the edge of the pulley and perhaps against a shifting finger or pulley flange, resulting in loss of power and frequently in a badly damaged belt.

A belt too narrow necessitates high tension to transmit the required power, thus causing excessive journal friction, consequent loss of production and the early destruction of the belt. Thin, wide belts give the best service working vertically. A thick, narrow vertical belt will not grip the pulley well.

Single vs. Double Belting.
Heavy vs. Light.

In general, single belts, if heavy enough to carry the load, should be used on small pulleys. A single belt should never be used where the width is more than 1 1/3 times the diameter of the smallest pulley. Where small diameter pulleys and the load would require an unusually wide single belt, it is advisable to substitute narrower pulleys and a narrower light double belt.

Double belts of medium or heavy weight should never be used on pulleys less than 12 inches in diameter, and it would be better to adopt 20 inches as the minimum diameter.

Belts too heavy for the load weave back and forth on the pulleys. This is best illustrated by a belt working under intermittent loads, the belt running straight while carrying the maximum or proper load, but showing a tendency to weave when the load is considerably reduced.

Center Stock vs. Side or Shoulder Stock Belting.

Belting made from center stock leather (first quality belting) should be used to carry heavy loads or where the conditions are unusual. For certain light work or underloaded countershaft work, side stock or even shoulder stock belting (second quality) will often meet the requirements satisfactorily.

Do not, however, be deceived by so-called first quality double belting made with one-ply center stock and one-ply shoulder stock; the two cuts and qualities of leather do not stretch uniformly and a belt so constructed will soon give trouble.

Oak Tanned vs. Spartan Belting.

Oak Tanned leather belting is recognized as the best belting for ordinary conditions.

For overloaded drives, where it is not feasible to get greater power by increasing the belt speed or the width of pulleys to enable the use of wider belts, recourse must be had to our Spartan Brand of Belting, markable for its pliability and, consequently, increased pulley grip and its great tensile strength. Where abnormal external conditions exist Spartan Belting should be used, as the specially tanned leather and the special cement used in its construction resist the injurious effects of water, heat, steam, oil, gases and acid fumes.

The above suggests only a few of the problems which must be met in installing a drive of maximum efficiency, but it illustrates the importance of carefully considering this question. Our Engineering Department is ready to solve any transmission problem, investigate or design any drive upon request. If you have certain belts or drives which are a source of annoyance and expense, consult us. Authentic engineering advice promptly submitted.

Subject for next month:—"Proper Installation of Belting."

"Wilson Bros." Hardwood Flooring

is the Flooring that is manufactured expressly to supply the demand for the best. It is made by modern machinery from carefully selected stock, and every precaution is taken throughout our entire system to make it fulfill the requirements in every particular. Write us for prices.

Wilson Bros., Limited - Collingwood, Ont.

A Good Belt Saves Money

THE money wasted in keeping a stretching belt taut amounts to a surprising figure. If you use "Goodhue Belts" in your mill or factory you can save most of this money because "Goodhue Belts" stretch less by 15 to 25 per cent. than any other belt. They are made from skilfully selected hides with the stretch taken out of each section before it is made up into the belt.

According to the conditions under which the belt is to run, we recommend "Extra," "Standard" or "Acme Waterproof" belts.

Send for further particulars and prices.

A New Swage

The Best Yet

United States Patent for Sale

This new swage invented by ourselves has all the good features of other swages plus some special patent features of its own. Those practical saw men who have used this swage pronounce it "The best yet."

View 1 illustrates a swage sawn in half to show its method of working. The tooth is swaged by a series of three rollers which cannot bind. The tooth is rolled out and not drawn.

A double thread is used on the locking lever The first thread is rapid so that a slight movement of the lever allows the swage to travel on the saw without being lifted over each tooth. The second thread is slow so that the swage may be securely locked on the saw. The point at which the rapid thread ceases and the slow thread operates is governed by an automatic spring.

We offer for sale the United States Patent If interested write us.

Breeze, Denison & Co.

Newburgh, Ontario

Rutherford's Stock Millwork

KLIMAX

If it's made of wood we can supply it. Our line of stock millwork embraces an immense variety of patterns in doors, newels, mouldings and other trim. Buy from our stock catalogue and you can save money and be sure of prompt shipment.

We are also equipped to cater for special detail work and keep a large plant in operation for this purpose.

The stocks we carry will always be found right up to the minute, and prices will be lower than obtainable elsewhere.

Write us for catalogue.

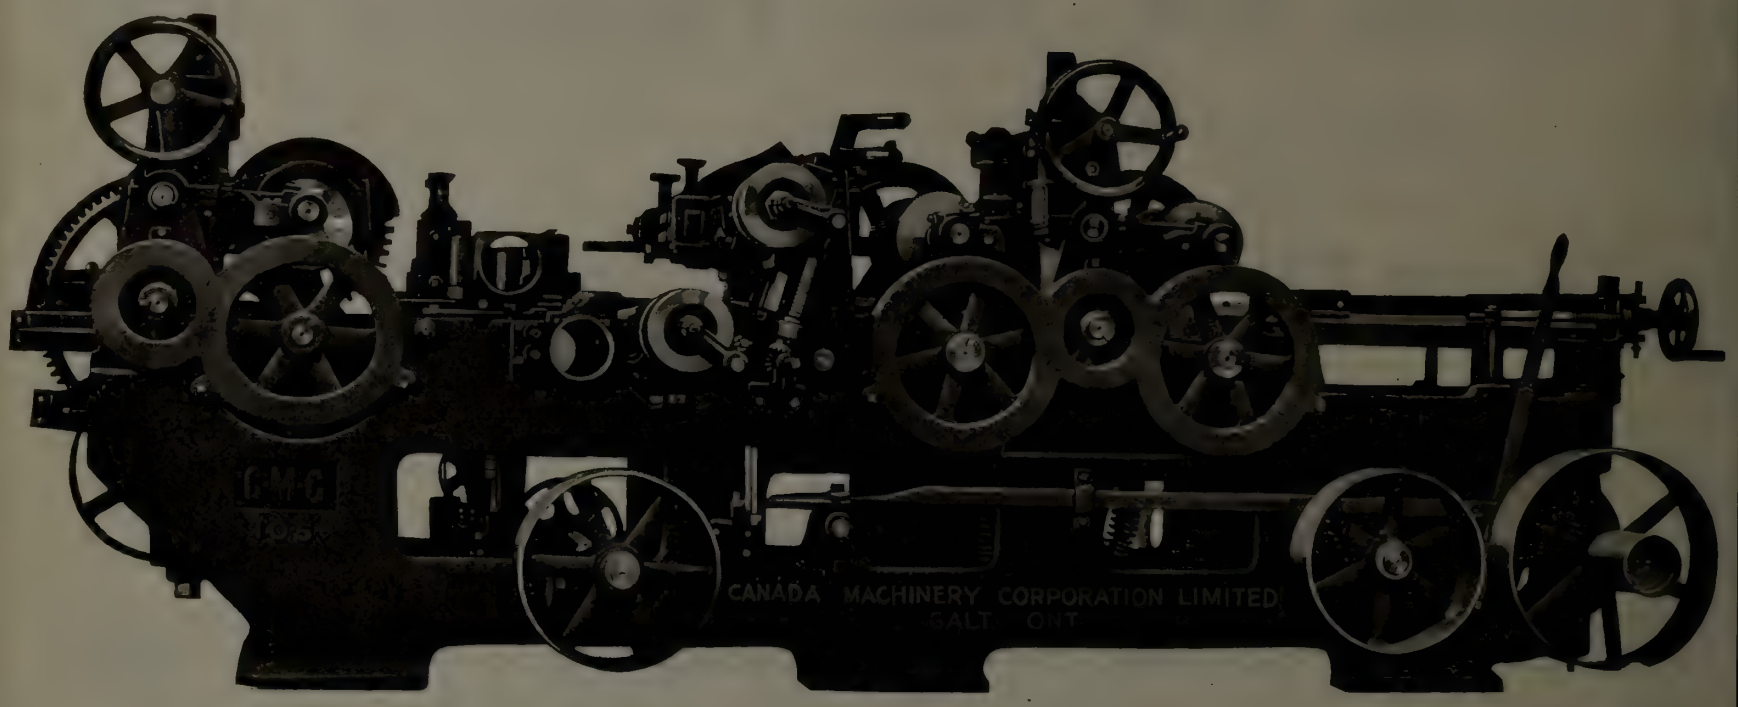
PLANER & C.M.C. MATCHER



15" Double Cylinder Planer and Matcher

Our No. 105 machine is a general purpose, medium heavy machine, especially suited for the general planing mill.

The feed range is from 45 to 100 feet per minute. Planes and matches 15" wide by 6" thick.

Full details and description contained in bulletin No. 105, sent on request.

Canada Machinery Corporation, Limited

Galt - Ontario

Largest Builders of Woodworking Machinery in Canada

This Type "E" Knife Grinder and Saw Gummer

is the smallest size we make. A practical up-to-date Bench Grinder at $65.00.

We make other grinders for sharpening knives up to 130-in. length.

Write for catalog showing the complete Rogers-Buffalo line.

SAMUEL C. ROGERS & CO.,

81 Lock Street :-: BUFFALO, N.Y.

DIXON'S

Solid Belt Dressing

These handy sticks, containing all the elements needed to keep a belt soft and pliable and adhesive can be rubbed on the belt while running. Their use keeps the belt in a condition of maximum service and longest life—cuts down the belting bill and prevents delays and shut-downs. Send for Booklet No. 239, "The Proper Care of Belts."

Made in JERSEY CITY, N. J., by the

JOSEPH DIXON CRUCIBLE CMOPANY

If You Could Make a Safe, Legitimate Investment of $100 Bring You Back $200 in a Year's Time, Would You Do It?

We would and we think You would.

An example:—Mr. Louis J. Landmeir, engineer in the above plant, tells us that scientific treatment of this belt with Cling-Surface costs him only 90 cents per year. Then he goes on to say:

"Belt has had Cling-Surface treatment about 3 years. It is very pliable. No trouble with belt slipping. Never have to take up belt. Used various belt dressings but never had such success as with Cling-Surface."

Can you immagine how 90 cents could have been spent to better advantage?

Don't you think Cling-Surface worth investigating?

Give it a trial and you will be convinced.
We quote f.o.b. Toronto.

4 oz. tins	3.50 doz.

Johnson's Condition Powders (Concentrated)

1 lb. Packages	3.60 per doz.

Johnson's Camp and Household Remedies, such as Cough Syrup, Healing Ointment, Headache Powders, Big 4 Liniment, Stomach Bitters, Cathartic Pills, etc., etc., have stood the test of twenty-five years and are in use all over Canada, from the Atlantic to the Pacific. Prices are lower than those of all other manufacturers. Letter orders receive prompt attention.

A. H. Johnson, Wholesale Druggist, **Collingwood, Ont.**

Are Your Horses in Good Condition?

Horses for all lumber work are subjected to the hardest hauling under the most severe conditions. They should therefore be as fit as all possible care and attention can make them.

In the Lumber Camp, Around the Mill, In the Yard

and wherever lumber has to be hauled the horses are always liable to a multitude of small injuries which if not attended to promptly may develop into lameness or disfigurement, thus reducing the working capacity of the horse and impairing its value from a sale standpoint.

You should always have handy and ready for use

Good Liniment

to reduce bruises, strains, soreness; allay pain and inflammation quickly, be an antiseptic dressing to a cut or burn, or to heal a wire cut, wound or laceration.

ABSORBINE

is an antiseptic healing preparation as well as a resolvent and a discutient. It will assist nature in bringing about a dissolution of the bunch, restore the circulation, gradually restoring the part to its normal condition.

It will produce permanent and complete results without blistering or removing the hair, and will leave no blemish. You can work the horse at the same time.

All enquiries on special cases answered without delay—full information and instruction on request. Absorbine $2.00 per bottle at dealers or express prepaid.

Manufactured only by

W. F. Young P. D. F.

Taylor and Arnold Ltd., Sales Agent, Montreal and Winnipeg

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Department of the Interior, Ottawa, Deputy Minister.
December 20th, 1912.

THE WATEROUS PORTABLE SAWMILL

What Users Say About It—

"Your mill is the best I have ever had."

"Can't be beat."

"If I was going to buy a mill to-morrow it would be a Waterous."

"My No. 0 Mill is capable of sawing 20 to 22 thousand a day."

"I'll back the mill against all the Riding Mountain permits."

"Always in shape for any kind of timber."

"This mill is O.K. For a steady runner you have them all beat."

"There is no mill I ever saw that you can handle so quick as the Waterous make."

"As good as the day it came out of the shop."

"We can cut 10 to 12 thousand feet a day and only four men operating."

"The carriage has no equal."

What We Say About It—

Saw Frame is of 9½ in. x 5 in. Red Pine, 3 ft. 11 in. wide, 7 ft. 11 in. long. Saw mandrel 2⅞ in. diameter by 6 ft. 8⅛ in. long runs in three self-oiling, adjustable capped and babbitted bearings; one set close to the saw—the others, one on each side of the driving pulley. Saw collars 5½ in. diameter, saws are any size up to and including 60 in. diameter, driving pulley 20 in x 12 in. Our direct acting friction feed works are a feature of this rig. They combine the flexibility and smoothness of working of the variable friction feed with a positive, powerful action impossible to obtain in the latter. Fittings include: 15 in. Wheel Splitter, Turn Down Timber Gauge, Waterous No. 0 Safety Saw Guide.

Saw Carriage is 16 ft. 11 in. long, made with knee opening from 24 in. to 40 in. will handle logs up to 32 ft. in length. Timbers of Red Pine, 6 in. x 6 in. Logseats of 6 in. steel girder, knees of cast iron, extra high, with rack cast solid. Set shaft, 16 ft. long is 1 15/16 in. diameter. Regular Fit-Dogs, Waterous Overhead Ratchet Setworks, Spring Receder, Brake Wheel and Lever, also carriage trucks underneath logseat consisting of 1 15/16 in. steel axles and 9 in. wheels. 55 feet "V" and flat track are supplied. Carriages can be driven by rack or cable fed as desired.

Skefko "S. K. F." Ball Bearing

Automatically Self-Aligning

"Ball Bearings in Woodworking Plants," on page 48 of the June 1st Canada Lumberman, gives in a very clear manner some of the advantages of Bal Bearings for power shafting.

In the case of shafting which is not properly lined up or quickly gets out of alignment, the ordinary ball bearing is little if any better than a plain bearing.

The Skefko "S.K.F." Double Ball Bearing is automatically Self Aligning and will operate as efficiently under the worst conditions as if the shafting was in proper conditions.

The perfect operation of Skefko S.K.F. Ball Bearings under conditions which would put every other bearing out of business is due to the spherically ground outer raceway of the bearing. Note how the bearing acts like a ball and socket joint.

Put your plant on the most efficient basis.
Install Skefko "S. K. F." Bearings.

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale:

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.

1 Double cylinder steam nigger, right hand.

1 Log Loader for right hand mill.

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.

1 left-hand steam nigger.

1 Log-loader.

1 Endless chain jack ladder with two kickers complete for right and left hand mills.

2 Roger Gang Edgers for 8-in. cants and lumber.

1 Waterous double edger, 6 saws.

2 2-saw trimmers.

1 20-ft. Slash table.

1 16-ft. Revolving Slash Table.

1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works.

1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.

1 Lath Mill with bolter.

2 Lath Trimming Saws.

FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.

1 Automatic Grinding Machine for 8-in. S.C. band saws.

1 Automatic Machine for circular saws.

1 Hand Machine for cut-off saws.

1 Lap Grinder.

1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws.

POWER PLANT

2 Double Duplex, high pressure Water Pumps.

5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.

2 125 h.p. Water Wheels.

1 Upright Engine for sawdust conveyor.

1 10 h.p. Engine.

1 Mitts & Merrell Hog.

1 Wood Machine for 22-in. wood.

1 Wood Machine for 16-in. wood.

1 Edger for ripping dry lumber, installed.

1 Edger for ripping dry lumber, not installed.

1 30 h.p. Generator, 250 volt.

1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

Columbia No. 2 Triple Drum Sander

(With Sectional Feed Rolls)

YOU ARE FAMILIAR WITH THE SUCCESSFUL APPLICATION OF THE SECTIONAL FEED ROLL TO A PLANER—YOU HAVE ONE ON YOUR CABINET SURFACER—PERHAPS.

Well, we have applied the same principle to our COLUMBIA NO. 2 SANDER with the same purpose in view and the results are most gratifying—you can crowd the machine full of stock of approximate uniform thickness, and, owing to the yielding sections of the Feed Rolls, each piece is carried through the machine independently, and all are equally well and perfectly sanded.

YOU CAN READILY UNDERSTAND WHAT IT WOULD MEAN TO YOUR BUSINESS

if you could use every inch of the bed of your Triple Drum Sander when sanding chair rockers, as shown in the above illustration, or other narrow material, it would mean the greatest possible output at the lowest cost.

Our Sander Catalog will acquaint you with the many other costs-reducing features that characterize our No. 2. We shall be glad to send it to you.

Timber Concessions in the Province of Quebec

Notice is given by the government of the province of Quebec that, on the 11th of August and on the 20th of October, 1914, permits to cut timber on over 8,000 square miles of crown lands will be offered at public auction.

The territory to be disposed of comprises some 1200 square miles in the basins of rivers Ottawa, Harricana and Bell, in the Abitibi region; 6,000 square miles in the lake St. John northern region; 350 square miles in the lake St. John East agency; 242 square miles in the Matapedia division.

On the first date above mentioned, permits will be offered at ordinary conditions on some 3,000 square miles.

The timber grants advertised for the 20th of October, comprising the basins of three large rivers in the lake St. John region with considerable water powers, will be subject to the obligation of manufacturing the wood into pulp or paper within the province of Quebec.

For particulars, please apply to the Department of Lands and Forests, Quebec, Canada.

Elz. Uiville Dechene
Deputy-Minister of Lands and Forests.
Quebec, April 11th, 1914.

For High Speeds and Small Pulleys

Slippage, stretching, parting at the plies, quick ruin—these are the effects of high speeds and small pulleys on ordinary belts. Add sudden overloads and you have a further good reason why belts made to "meet a price" have to be renewed so often.

Goodyear Belts are made to meet actual service conditions. These are the belts Goodyear Engineers have designed for driving Edgers, Trimmers, Planers, Molders—all lumber-mill machinery of high speed, variable load and small pulleys.

"Extra Power"

A high-speed belt for high speeds and heavy drives. This belt shows the highest friction and pull of any belt we know of.

"Extra Power" is made to "stand up" under the most grueling service. The duck is the heaviest and strongest used in any Goodyear belt. This and the high grade rubber friction are laboratory tested for super-service. The stretch is taken out in the making. There can be no ply separation—the Goodyear construction takes care of that.

GOODYEAR TORONTO
Rubber Belting

"Imperial"

Here is the belt for high speed and small-pulley conditions. Its flexibility enables it to readily conform without imposing on the outer plies. This insures a maximum arc of contact, which means maximum power delivery and no slipping. A fine belt for trimmer work.

Ask Goodyear

Put your belt problems up to Goodyear experts. At our Bowmanville factory these men are designing belts to meet actual working conditions.

They can tell you just what Goodyear belt you need—and why. Service being the paramount consideration, the economy takes care of itself.

Also Hose, Packing, Valves

These experts have also designed hose, packing and valves to meet every exact purpose.

Before buying any factory equipment, consult these men. Asking questions costs nothing. The same quality-standards that have won Goodyear leadership in tiredom govern in this field also.

Stop experimenting. Buy service equipment the Goodyear way.

Solid and Inserted Tooth
Circular Saws

We make a specialty of these lines

We remake old Solid Tooth Saws into new Inserted Tooth Saws

Write to us for quotations.

Our saws have been before the public of Canada since 1855, and have won a reputation far excelling any other make of saws, combining as they do so many points of marked superiority.

By the old method the tempering of circular saws was to a great extent a matter of chance.

By our Patent Process that uncertainty is entirely avoided.

Being tempered and straightened by heat and pressure in air-tight ovens at a uniform heat between heavy revolving plates, we produce a perfectly even temper throughout the plate, and being free from that uneven strain or tension caused by so much unequal hammering they are not so liable to buckle, which was a great source of trouble and expense in the old style of saw.

These saws will stand up to their work better under all circumstances, and being made of a higher quality steel than it is practical to use by the old method, they hold an edge longer and will do more work than any other saw on the market.

We are prepared to make prompt deliveries of all Saw Orders—Rush Orders by mail or wire receive immediate attention.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3.00.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 34 Toronto, July 15, 1914 No. 14

Trade Commissioner's Report Stirs Up Disapproval

At a meeting of the lumber committee of the Vancouver Board of Trade held recently, the secretary pointed out that Mr. Egan, Dominion trade commissioner for South Africa, had made reports to Sir George E. Foster, minister of trade and commerce, reflecting upon the standard and inspection of lumber shipped to South Africa. The secretary had received communications, he said, from all foreign shippers in the province, who emphatically stated that lumber in British Columbia was subject to the same inspection as that of Oregon and Washington, and was on no occasion complained of in the markets of South Africa. The matter will be brought to the attention of Sir George E. Foster in the endeavor to remove the bad impressions left by Mr. Egan's report.

Apparently Mr. Egan sought to assist Canadians in selling more lumber to South Africa, and if his information is well founded, the matter is one requiring more than an expression of dissatisfaction with his report. We do not wish to reflect either upon Canadian shippers of lumber or upon Mr. Egan, but simply to urge that Mr. Egan's report should be enquired into carefully by the Government, for he says that all dealers inform him that they would like to handle Canadian lumber more extensively, but that this is impossible as they "cannot depend on any two consecutive shipments from one source; a board received on shipment at equal price and market conditions may be much inferior to the next shipment."

The rest of Mr. Egan's report was as follows:

Sweden grades her lumber Nos. 1, 2, 3, 4, and 5. No. 1 permits a very few small hard knots. No. 2 permits of a few more than No. 1. Nos. 3, 4, and 5 are graded according to the number of knots whether loose or tight. No. 4 and 5 also allow wain, shake and almost every fault lumber can have. Baltic lumber is not graded officially but certain mills have established reputations for standard shipments and they can be depended on by the trade to make standard grade deliveries.

The lumber from British Columbia to the South African market is shipped principally to Durban and is placed usually through London or San Francisco. This has always given satisfaction and is usually delivered on a standard order, "the usual assorted South African cargo."

The demand is not for an improvement of grade in Canada lumber; it is for the establishment of a standard of quality in each grade and, of course, an official inspection of same. This will give a guarantee to the foreign purchaser, which places him in the position of knowing what stock he will have on hand when he receives delivery of his order.

The orders placed now for British Columbia lumber are in the hands of a limited number of coast dealers, and it is certain that the moment it becomes known that Canada or any portion of Canada is prepared to ship lumber according to certain standard grades, the demand will come from many sources. This will mean an increased trade for Canadian lumber in South Africa and other importing countries.

Thinks Canada is Getting too Much

The Wall Street Journal, one of the most important financial papers in the United States, devotes a column of a recent issue to an effort to persuade President Wilson that the depression in the lumber and shingle market is largely due to the recent removal of the duty. Canadians will probably take such an argument with a grain of salt, as they find trade depression general in all the principal markets of the world, and confidently expect those in the United States to improve at the same time as the rest. But, just to illustrate the situation in the United States, and the way it is looked upon by some people, we reproduce part of the Wall Street Journal's article, in the form of a letter to its editor from Charles E. Patten, vice-president of the Atlas Lumber Company, Seattle, Wash., manufacturers and wholesalers of lumber and shingles. Mr. Patten says in part: In May, 1913, our payroll was $29,176.76; in May, 1914, our payroll was $16,622.05; in May, 1913, we had on our payroll 293 men; in May, 1914, we had on our payroll 181 men; our total output in May, 1913, was 6,950,744 feet of lumber; our total output in May, 1914, was 2,423,160 feet of lumber; in May, 1913, we booked orders for 3,615,381 feet of lumber; in May, 1914, we booked orders for 1,747,283 feet of lumber; in May, 1913, we booked orders for 5,216,000 shingles; in May, 1914, we booked orders for 2,976,000 shingles.

In looking over the records of some fifty of the leading mills in Washington. I find the following shrinkage in prices received by them:

	May 1913	May 1914	Dec.
No. 1 VG fir flooring	$28.50	$23.00	$5.50
No. 2 fir ceiling	15.50	12.00	3.50
No. 2 fir drop siding	19.00	14.00	5.00
2 x 4 fir 12 to 16 ft.	9.00	6.50	2.50
Car sills	20.00	11.00	9.00

Will also state that a year ago, one of our greatest troubles was to secure men. We found it almost impossible to operate our mills for lack of men, although we were paying the highest wages ever known in the State of Washington, and our mills were running full time. Last October, a large number of our mills closed down and are still idle, and wages have been reduced from 25 to 50 cents per day, and unless business improves by July 1, the manufacturers will be compelled to make another reduction in wages, in addition to reduction already made. A great many of our men have had steady employment only three months in the past eight.

Prior to the present removal of duty from shingles, it is estimated that the shingle mills of British Columbia were operating not more than one-half time, and under the old law, there were practically no shingles imported into the United States. Since the first day of January, there have been built in British Columbia shingle mills containing a total of 126 addition shingle machines, and even with this additional capacity, every mill is running full time and a great

many of them operating nights. All of the additional shingles manufactured are being shipped into the United States.

Although the Government has refused to furnish us with the number of shingles now being imported, it has been variously estimated at from 700 to 1,200 cars per month, and as the average shipment from the State of Washington for the past ten years has been about 2,500 cars per month, it means that we are now losing one-half of our shingle trade, which means that one-half of our mills must close down and one-half of our present employees secure employment in other lines, and the remaining half work at a reduced wage scale. As Oriental labor is used almost entirely in the shingle mills of British Columbia, it is estimated that their labor cost of manufacture is from 25 to 40 per cent less than our labor cost.

We believe that 75 per cent of the depression in the shingle business is due entirely to the removal of duty, and a very large part of the reduction in the price of lumber is due to the same cause, and the balance is due to the various laws passed by the present session of Congress and the fear of the passage of more freak laws. We believe if Congress would adjourn without passing any more laws, that with the bright crop prospect, business would greatly improve, although the lumber and shingle industries will be seriously affected for years on account of the removal of the tariff.

Small Bush Fires—A Recent Lesson

On the morning of June 9th a small tuft of grass was seen to be smouldering on some vacant land in the southern part of the town of Hearst—a Divisional Point on the Transcontinental Railway, about 130 miles west of Cochrane. Several people appear to have noticed it; but it was too insignificant, too trivial to need attention (so they thought); and they passed on without giving the matter further thought—for the time at any rate. Later in the day they probably regretted that they had not devoted a couple of minutes to smothering the few square inches of smouldering material. However, it was none of their business; it was nobody's business; and the incipient blaze was allowed to smoulder on.

There was a fairly strong south-west wind blowing at the time, but at noon this had increased to a hurricane. Whilst most people were at dinner the fire in the insignificant tuft of grass had, fanned by the furious gale, eaten its way over a large portion of the vacant lot, and was fast threatening the buildings in the vicinity. Then there was general alarm throughout the town; and eighty or a hundred men turned out to fight the flames. They fought bravely and untiringly; but it was too late. What one man could have done two or three hours previously, a hundred men could not now accomplish. One building took fire, and then all hope was abandoned, for in such a breeze it was useless to attempt further to battle with the flames. In an hour or so, half of the town was reduced to ashes, and the bush on all sides, ignited by the flaming debris from the town, was burning furiously; and all because people had ignored a little tuft of burning grass!

The damage in the town itself was about $50,000. What damage was caused to standing timber in the bush it is impossible to say, for no one knows definitely where the fire finally exhausted itself.

There is one lesson to be learned from the Hearst fire—and it should not go unheeded in the North Country where the bush fire menace is becoming more and more serious every year. The public should have the fact impressed upon them that no matter how small and insignificant a portion of bush or undergrowth may be burning, the only safe policy is to extinguish it at once. This piece of advice is so perfectly obvious to even the most simple mind, that it may appear almost an insult to put it into print for the guidance of an intelligent public. That it is necessary advice, however, the Hearst fire may be cited as a recent and conclusive piece of evidence.

It is advice, moreover, which cannot be enforced too strongly or too insistently by the Government on the fire-rangers. There is an impression in the minds of some people that the fire rangers are appointed for the purpose of extinguishing big bush fires when they occur, but when a fire has taken hold over even a very small area a couple of fire rangers are as helpless as a new-born babe. Even a perfect force of fire rangers would be practically useless except for the purpose of extinguishing incipient outbreaks. If they could be trusted to patrol their beats regularly, and attend to every little smouldering mass which they come across, the number of bush fires which have to be recorded annually would probably not be so great.

"Oh, it's only a little affair. There's no danger from that," is the comforting assurance which a ranger or other party gives himself too frequently when he comes across one of these small fires. The weather is too hot or they are too indolent to give it proper attention and they pass on. In some cases it really proves to be a "little affair" with "no danger" but small smouldering patches ignored by the fire-rangers have been known afterwards to develop into serious conflagrations. The fire-ranger who is faithful to his oath, and loyal to his duty will see that every small fire which comes under his ken is properly extinguished before he leaves it. The public should do the same.

"Where there's smoke there's fire" and where there's smoke or fire in the bush there's danger to life and property unless the utmost care is taken to prevent the outbreak from spreading.

Canadian Exports and Imports of Wood Goods

According to the annual report of the Department of Trade and Commerce the imports of products of the forest into Canada free of duty during the year ending March, 1914, were valued at $16,201,612. The exports of forest products for the twelve months amounted in value to $43,386,087. In the year ending March, 1913, the value of the exports of forest products was $43,697,623.

Exports of pine deals during the year ending March, 1914, were valued at $1.408,709 as compared with $1,386,708 for the preceding year. Most of these deal exports were to Great Britain, the total being $1,322,326. During the preceding year the value of the exports of deals to Great Britain was $1,285,863. Exports of pine deals to the United States showed a decrease, being valued at $61,616 as compared with $78,355 during the preceding year.

Exports of spruce deals during the year ending March, 1914, to all countries were valued at $6,547,854. In the preceding year the value was $5,513,543. Most of these exports were also to Great Britain, the value being $5,947,348 as compared with $4,683,821 in the preceding year. The exports of spruce deals to the United States showed a falling off, the value being $513,883 as compared with $743,561 in the preceding year.

Exports of planks and boards to all countries during the year ending March, 1914, were valued at $19,522,675. During the preceding year the value under this heading was $20,839,098. The largest export of planks and boards was to the United States, the total being $15,257,076 which is a falling off from the total of the preceding year which was $16,247,450. To Great Britain the exports of planks and boards during the year ending March, 1914, were valued at $1,772,368 as compared with $1,825,549 during the preceding year. Exports of planks and boards to the Argentine during the year ending March, 1914, were valued at $1,276,295.

Shingles were exported from Canada during the year ending March, 1914, to the value of $1,775,619 as compared with $1,409,116 during the preceding year. Most of the exports of shingles were to the United States, the total being $1,738,879 as compared with $1,374,569 during the preceding year.

Exports of laths to all countries during the year ending March, 1914, were valued at $1,699,221. Practically all of these were to the United States.

Exports of scantlings during the year ending March, 1914, were valued at $1,264,881.

Pulpwood exports to the United States during the year ending

March, 1914, were valued at $7,388,770 as compared with $6,806,445 during the preceding year.

Exports of wood pulp during the year ending March, 1914, were valued at $6,364,824 as compared with $5,509,544 during the preceding year. During the year ended March, 1914, the exports of chemical wood pulp to the United States were valued at $2,660,013. Mechanical wood pulp exports during the same period to the United States were valued at $2,254,621 and those to Great Britain at $1,162,470.

Imports of planks, boards, etc., dressed on one side only, which enter Canada free of duty, during the year ending March, 1914, from the United States were valued at $4,423,245. The total value from all countries was $4,428,341, which is a considerable falling off as compared with 1913 when the value was $6,089,548.

Imports of oak lumber and timber from the United States during the year ending March, 1914, were valued at $2,629,788. During the preceding year the value was $3,227,113. In the year ending March, 1912, the value was $2,449,542.

Imports of pitch pine during the year ending March, 1914, were valued at $2,912,363, during the preceding year the volume was $2,435,376 and during the year ending March, 1912, the value was $1,929,923.

During the month of May, 1914, Canada's exports of forest products were valued at $3,296,455, as compared with $3,039,563 and $2,885,812 during the corresponding months in 1913 and 1912. During the months of April and May the exports were valued at $5,171,194, as compared with $4,909,278 and $4,363,854 in the corresponding periods during 1913 and 1912. For the twelve months ending May, 1914, the exports of forest products in Canada were valued at $43,054,053, as compared with $43,800,484 and $41,410,417 in the corresponding twelve months for 1913 and 1912.

Timber Preservation Increasing in the U.S.

The most notable progress yet recorded in the United States in the chemical treatment of timber to prevent decay was made in 1913, according to a report recently issued by the American wood preservers' association in co-operation with the forest service of the department of agriculture. The report states that 93 wood-preserving plants in 1913 consumed over 108 million gallons of creosote oil, 26 million pounds of dry zinc chloride, and nearly 4 million gallons of other liquid preservatives. With these the plants treated 153 million cubic feet of timber, or about 23 per cent more than in 1912. The output from additional plants unrecorded would increase the totals given.

Impregnation of wood with oils and chemicals to increase its resistance to decay and insect attack, the report goes on to say, is an industry which has become important in the United States only in recent years. In Great Britain and most of the European countries practically every wooden cross-tie and telephone or telegraph pole receives preservative treatment. In the United States less than 30 per cent of the 135 million cross-ties annually consumed are treated, and the proper treatment of an annual consumption of 4 million poles may be said to have scarcely commenced.

Real progress in the United States dates from 1832, when the Kyanizing process, using bichlorides of mercury, was developed. In 1857 two other processes were introduced, the Burnett process using zinc chloride, and the Bethel process using coal tar creosote. These last processes are very largely in use to-day. The idea of timber preservation at first made very slow growth in the United States, on account of the large supply of cheap and durable timbers and the general disregard shown toward economy in the use of natural resources. In 1885 there were only three pressure plants in the United States, and in 1895 only 15.

Lumber Trade Opportunities in Cuba

The lumber trade (imports) of Cuba is chiefly confined to yellow pine, spruce and white pine, which are exempt from customs duties when not manufactured, says a recent Trade and Commerce report.

Cuba imports over 100,000,000 feet of yellow pine (grade 2) per annum, and it is supplied by the United States, shipments being made from Gulf ports, freight rates fluctuating from $5 to $6 per thousand feet. This lumber is used in Cuba in the construction of buildings, etc., and the demand must naturally increase with the development that the Island is now going through.

In the exportation of spruce to Cuba, Canada figures with about 15,000,000 feet. This wood is imported in schooner loads, freight being about $5 per thousand feet; sometimes steamers are chartered. As this lumber is used only by manufacturers of boxes and similar industries, the demand for the time being is likely to remain stationary.

Canada also contributes about 3,000,000 feet of white pine, which like the spruce is exported from eastern ports of the Dominion. This lumber must face the competition of Cuban cedar, and it is estimated that the trade is subject to decrease.

From the data given it will be seen that yellow pine is the only trade worth figuring on for the Cuban market, with reasonable prospects of success. In timber regions where yellow pine cannot be procured it becomes necessary to figure on some other kind of lumber which would answer the same purpose as yellow pine (grade 2) and that could be offered at a price which, with the addition of freight rates, plus canal tolls, would compare favourably with the prices and freight rates offered by the United States Gulf ports. If this is practicable, then western Canada lumber can find markets in Cuba, and be in a position to enter the contest to secure a share of the 100,000,000 feet imported by Cuba every year.

It is believed that Oregon, Washington and California are looking to the Cuban market for the sale of their lumber via Panama Canal. While conditions in these States do not appear to be very different from those of western Canada, it would be advisable that Canadian lumber merchants should take the necessary steps to carry on competition. Samples of lumber would assist the Acting Canadian Trade Commissioner at Havana in carrying on a closer investigation as to possibilities of business, and at the same time full particulars of conditions, prices, freights and prospects should be given in order that no time be lost in preparing the ground in the event of that trade being feasible.

The class of lumber produced in British Columbia most suitable for the Italian market is the Oregon pine, or so-called "Douglas fir," says a recent trade report. Owing probably to climatic reasons it does not give as good results as pitch pine, but it could command a sale in Italy on account of its large width and the absence of knots. Several years ago, due to favorable freights, three full cargoes were imported into Genoa, but since that time small parcels of from 20-50 standards which have been received were sold at a loss.

Austrian and Swedish pitch pine is sold in large quantities at a price of about £12-£12 10s. per standard c.i.f. Genoa, and if Oregon pine could be placed on the market at about the same price it could be sold in competition with the former. Shipments would be most convenient by full sailing ship or chartered steam ship cargoes direct; the small parcels referred to were shipped by liner steamers, which call at Naples, Genoa, and Marseilles, on their way to the United Kingdom.

Canadian timber in logs or in sawn lengths enters Italy duty free.

The Reader's Viewpoint on Trade Topics

Western Crops Promise Improvement in Lumber Market—Ontario Retailers Report Continued Trade Activity

Mr. J. L. Campbell, of the firm of Campbell and Johnson, wholesale lumber dealers, Toronto, recently returned from a two weeks' visit to the Prairie provinces. Speaking of conditions in the west Mr. Campbell said:—"Owing to the lack of rain in the vicinity of Winnipeg, in the Morden district, in Southern Alberta and Southwestern Saskatchewan, there will not be much more than half an average crop. In the rest of the three Prairie provinces the crop prospects are better than they have been for some years. In my experience of twenty-one years I never saw such a grand outlook for the crop. As a rule, you will find districts with good crops and bad in them, but with the exceptions I have already mentioned, the crops are uniformly up to a high standard. I should say there are districts where—if nothing should happen to the crops—there will be an average of from 25 to 30 bushels to the acre. On the first of July the heads of the grain were just coming out. That crop should be ready for the binder about the 12th of August.

"Business throughout the west is very quiet. Everybody is watching and waiting for this crop. Should the prospects be fairly well realized there will be a large profitable crop.

"One prominent feature of the business situation throughout the country is that everyone has been buying very little during the present year; merchants from hand-to-mouth, and farmers only what they cannot get along without.

"The proceeds of the crop should relieve the financial situation a great deal. Ontario especially should feel the benefit of it as collections from the west will be much easier to make.

"The Western country is not affected very much by the world-wide stringency. The time has come in the west when they must depend in future upon production, not upon foreign money which they have borrowed. If they get good crops this year the country will be alright irrespective of outside conditions.

B. C. Trade Looking for Better Times

Editor Canada Lumberman: Vancouver, B.C., July 2.

The practical abolition of the tariff on Canadian lumber by the United States Government has had the effect of materially stimulating the cedar industry in this province. Relatively, we have a much larger stand of cedar than Washington or Oregon.

Lumbermen who make a specialty of manufacturing cedar are making purchases of standing timber, and quite a number of them are preparing to build mills, and would have done so earlier, had it not been for the depression through which we are just passing.

The lumber market, as you know, has been at a very low ebb, but at present the demand is improving, and, while prices remain low, we expect better times in the near future, especially if crops in the North-west turn out as predicted.

The Panama Canal does not exist in the doubtful future, but is a reality, and before the end of 1914 we will be shipping lumber by steamers at a lower rate than we can secure by sail around the Horn, and will be able to deliver lumber to the Atlantic seaboard more quickly than shipments by rail. The opening and operation of the Panama Canal will take a great deal of our surplus lumber, relieve the congestion, and put the industry on a much better basis.

Nearly everyone in the sawmill business realizes that prices have touched bottom, and we are all hopeful for the future. Good standing timber of all varieties, being well located, has held its own in price, and in fact has advanced in price with a few exceptions, where owners were not able to carry same.

With the early completion of the Grand Trunk, the Canadian Northern, and the new line of the Great Northern to Vancouver, our home market will be widened materially.

There has been a good demand for cedar poles and piling during the entire year.—C. S. Battle.

Expects Cheaper Labor This Year

Editor Canada Lumberman: Wilberforce, Ont., July 2.

There is a falling off in the local demand for lumber. This is due to the crop failure of last year. Of course the demand here is very small at any time. Prices however, are not affected. Correspondence with manufacturing consumers at outside points leads us to the conclusion that they are overstocked with hardwood. It does not seem to be a matter of price with them. They simply will not buy until business conditions brighten up or until they require fresh material. Some of them claim that they have stock enough on hand to last for one or two years, and they simply will not buy.

As to the cost of labor; I could employ plenty of local help for a good camp at from five to seven dollars per month less than a year ago. The labor problem has been the greatest trouble of late, and now it looks as though there would be a much needed change. Paying from $35 to $40 per month with better board than you could get in hotels charging $2 to $3 per day, and with work so plentiful that you simply had to take any man and let him do as he liked, has not been in the best interests either of the lumberman or of the employees. The large mills have been the offenders as they have been paying more than the limit and taking chances. This has made it very bad for the man with a small business. In my own case, my lumber cost me more than jobbers would pay. However, as I have sold my little stock direct to the manufacturer, I have managed to make a small profit. With the demand as it is at present it seems to me that the cut this winter will be light and wages at least 30 per cent lower.—H. S. Mulloy.

Toronto Retailer Wearing a Smile

Editor Canada Lumberman:— Toronto, July 6.

We have been doing business for the past two and a half years in the old stand of Martin McKee & Son at 1074 Queen Street E., and, up to the present, have had no reason to complain, as we have always had about as much business to do as we can handle. There are always two or three months in the winter when the planing mill man expects quiet business, but even during these months we had plenty to keep our usual staff of men at work. When we took off our balance for the month of May we found it to be the best month we ever had, and at the end of June we found that it had been a great deal better than the previous month.

Taking everything into consideration we fail to find any cause to murmur, and although many people tell us that times are going to be bad, we intend to keep on smiling and enjoy the present for certainly our district looks as if it will take a large quantity of lumber before the hundreds of buildings now commenced will be completed.

The customers we have in this part of the city all appear to be in a prosperous position, for, as a rule, they pay up their accounts promptly, which is a great help and makes doing business very pleasant.

We can honestly say that at present we have more orders on hand than at any previous time in our history and so long as things remain like this we will be quite satisfied and able to wear a smile. —R. A. Rastall & Company.

Strathroy Trade Fairly Active

Editor Canada Lumberman: Strathroy, Ont., July 2.

I believe the trade in Strathroy and the surrounding country is as good as could be expected and probably better than last year. There are a great many houses going up in town and also in the surrounding country. I believe the reason that the wholesale lumber business is not as good as previous years is the existence of hard times in the United States, making prices of lumber there much lower than they were last year. In consequence, the Canadian wholesalers have strong opposition or competition in the lumber trade with United States cypress, yellow pine and hemlock, which are being delivered from the United States at lower prices than those for which you can buy hemlock from Canadian dealers.

Cypress is a wood that can be used for any purpose. So, naturally, if you can buy cypress of as good a grade as hemlock, and at as low a price, a dealer will take the cypress in preference. I do not think the condition will change for some time, or until the prices have stiffened in the United States, which, I believe, will be in the course of a year.—R. W. Nicholson.

Good Trade at Marmora

Editor Canada Lumberman:— Marmora, Ont., July 3.

The lumber trade is good in our section. We cut our stock to order last winter and have shipped out a lot of it already. The home trade is good, as there have been several fires in our town, and insurance was carried in each case, so that the buildings are being put up again. Some buyers are quoting a little lower than last year; others are paying just as much.—J. W. Bonter.

Editor Canada Lumberman: Tottenham, Ont., July 6.

In our experience during the past 25 years in the lumber busi-

ness we have never found trade so dull or the outlook less promising. The money market conditions have a serious effect on trade, and, as the banks have tightened up on customers, trade in general has slackened seriously.—Wm. Potter & Son.

Finds Trade Still Slow

Editor Canada Lumberman: Mountain Grove, Ont., July 3.

We find that the lumber trade this season is very slow. There seem to be a lot of wholesalers looking for trade, but buyers are all very careful. The wholesalers all report that it is hard to secure orders and that trade is very slow.—Card Bros.

Welland Trade Improving

Editor Canada Lumberman: Welland, Ont., July 2.

I find that trade is picking up very nicely. I am running full handed here, and there seems to be as good a market as last year, and slightly improving all the time.—S. L. Lambert.

Plenty of Business Now Offering

Editor Canada Lumberman: Toronto, July 7.

While business recently has not been as satisfactory as I would expect, we are receiving very nearly all the orders we can handle and hope to do so from now on.—T. H. Hancock.

An Albany Dealer's View of the Spruce Market

In a recent issue of the New York Lumber Trade Journal, Mr. Curtis N. Douglas, of L. Thomson and Company, is reported as having spoken as follows in connection with the market for spruce lumber:—

"Speaking in a general way, the demand for spruce during the last twelve months has been uncertain and feeble. Although the production of spruce in Canada and the Adirondacks has not been excessive, the demand has not been sufficient to sustain prices. Under the inexorable law of supply and demand, prices have been gradually falling until they seem now to have about reached bottom. Of late this opinion has seemed to prevail among buyers of spruce in the Metropolitan District with the exception of the Borough of Manhattan. Some large specifications for 13 and 16-foot spruce have come to wholesalers during the last two weeks, but the buying has not been sufficiently strong to steady prices. Some of the larger wholesalers are accepting orders for round amounts of spruce at going prices, and if the buying continues to increase to some extent, the pressure of spruce from wholesale sources will soon subside.

"One feature of the present situation is the shortage of logs at Canadian mills. A very large percentage of the logs cut last winter has been hung up in side streams on account of the spring floods running away too quickly. Unless unusually heavy rains fall during the summer, some of the Canadian mills will be short of logs and will be compelled to shut down in a few weeks. I hear that some Canadian mills have not yet begun to saw this season, and may not operate at all on account of the lack of enough logs to make it profitable.

"So far as my observation goes, retailers in the Metropolitan District are carrying incomplete stocks of spruce, and I may say that the stock of spruce in Albany at present is smaller than it has been for many years. Under these circumstances it would not take a great increase in the demand to steady the market quickly.

"A number of Canadian manufacturers of spruce are sitting back comfortably and smiling serenely. They have a good reason for doing so. Most of them sold their cuts of spruce last winter at the highest prices on record. At prices prevailing in this market now, the middle man who made the purchases cannot get out even. We can see now that it was a fictitious market that prevailed for Canadian spruce last winter, and some of us, both Canadians and Americans, thought so at the time. However, I am not a pessimist as to the future of the spruce market in the long run. Taking a broad view of the situation, I think we shall see increased activity and steadier and better prices soon after September 1. Nearly all the spruce that was wintered by American owners at Canadian mills has been disposed of. Consumers of spruce who are going into the market now, or who will go in later, will have to depend on this year's cut to fill their wants, and this year's cut, from all sources of information at hand, is very likely to be short of the average annual production. These are my views of the situation as regards spruce, and I give them for what they are worth, realizing that no man's judgment of the conditions that exist at present is infallible.

"There is one more feature of the present situation in viewing the lumber markets of the United States as a whole, and it is a very important one. The greatest crop of winter wheat ever known is now being harvested in Oklahoma and Kansas, and the outlook for winter wheat in the other wheat-growing States is excellent. The effect of this great crop is being felt in an increase of the retail trade in the Western States. In the past, a great crop of wheat has been followed almost immediately by a decided increase in the demand for and the consumption of lumber. If the past repeats itself, and it is very apt to do so, the demand for lumber in the west will take care of pretty nearly the entire production there. It has happened before that a lively demand for lumber in the west has greatly strengthened the markets for lumber in the east, and I think this probability is quite likely to become a reality this autumn."

English Views on Panama Canal Trade

The weekly report of the Department of Trade and Commerce issued on July 6th contains further reference to foreign markets for Canadian lumber, supplementing those which have been published in previous issues. A report from the Trade Commissioner at London, England, states that representative timber brokers are not favorably impressed with the prospects for increasing trade in British Columbia timber after the opening of the Panama Canal. Few however, are willing to express their opinions for publication, preferring to wait until the route is open and freights and tolls have been definitely announced. It is generally considered that the Pacific Coast lumber business is in an unfavorable geopraphical situation compared with other sources of supply.

Freight Rates

Up to the present the freight from British Columbia ports to Great Britain has been usually from one-third to a half greater than from gulf of Mexico ports, and authorities are doubtful that any reduction which may be effected by the canal will nearly approximate this difference. During the recent shipping boom freights from British Columbia were up as high as 100s. per 1,000 feet; at which time gulf of Mexico freights hardly advanced above 50s. One expert, in order to illustrate the nature of the freight competition in various kinds of pine wood which British Columbia has to meet, suggested the following somewhat rough comparative table:—

British Columbia to the United Kingdom ..	1s.	per cu. ft.
Gulf of Mexico to the United Kingdom ...	6d.	per cu. ft.
Eastern Canada to the United Kingdom ..	3½d.	per cu. ft.
Sweden to the United Kingdom	1½d.	per cu. ft.
White Sea to the United Kingdom	3d.	per cu. ft.

A very important advantage which should, however, result from the opening of the canal route will be a considerable increase in the tonnage available, because the absence of frequent and regular means of transportation has undoubtedly been a great handicap to British Columbia ports, even more than to the United States. As a rule this has necessitated the transmission of British Columbia lumber in cargoes, entailing a large financial responsibility which could only be undertaken by the most substantial firms, and although in recent years there have been greater opportunities for shipping "parcels," the cargo practice has to a certain extent limited transactions. The change will not, however, be without its disadvantages, because the business will no longer be so attractive to the large firms who have so far practically enjoyed a monopoly of the business, but upon the other hand, with the timber coming in more freely and regularly, it will doubtless become better known among consumers, and its use become more general.

Opinion of a Principal Firm

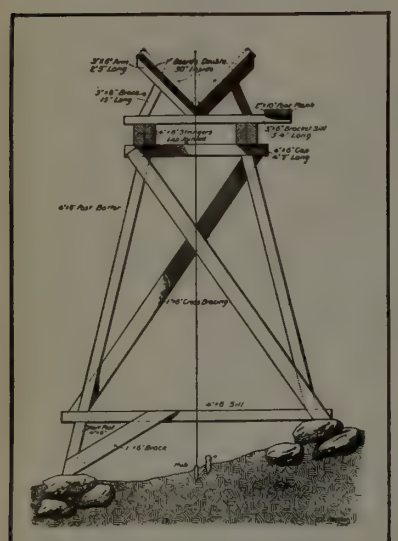
The situation is very well summed up in the following extract from a letter of one of the principal firms of wood brokers, whose opinion was sought on the subject:—"The opening of the Panama Canal is expected to develop imports of wood from the Pacific coast to the United Kingdom, but to what extent it is difficult to forecast, for at present there is only a limited and not a free sale for these shipments, whereas for pitch pine from the Southern States and spruce deals from the lower provinces, there is always a free outlet; however, at the present time market conditions are unsatisfactory. In due time as the supplies of pitch pine become reduced, our opinion is there will be an increased inquiry for British Columbia lumber, but as regards the cheaper whitewoods, such as spruce, Russia has, during the past few years, shipped very heavily, and it is now a strong competitor with Canadian spruce."

The Timber Trades Directory

We are in receipt of the seventh edition of the "Timber Trades Directory," which is a work of unique value to all engaged in, or connected in any way with, the timber and wood-consuming trades. The arrangement is alphabetical throughout, under the following sections:—London and District, the Provinces (arranged in counties), Wales, Scotland and Ireland. The foreign section of Importers and Exporters in the various Foreign Countries for their wood supplies, laying under contribution almost every country in the world. As showing that the book is abreast of the times, we may mention that it includes the names of firms who make a specialty of supplying aeroplane wood, and attention is also given to the important and expanding trade in plywood. The value of the volume is very much increased by the plans of the principal timber receiving docks in the kingdom which are included. This directory is published by William Rider & Son, Limited, 8 Paternoster Row, London, E.C., price 7s. 6d.

The Construction of Flumes for Timber

Methods Used in Erecting Different Varieties of Wooden Logging Flumes— Sectional Metal Type Increasing in Favor



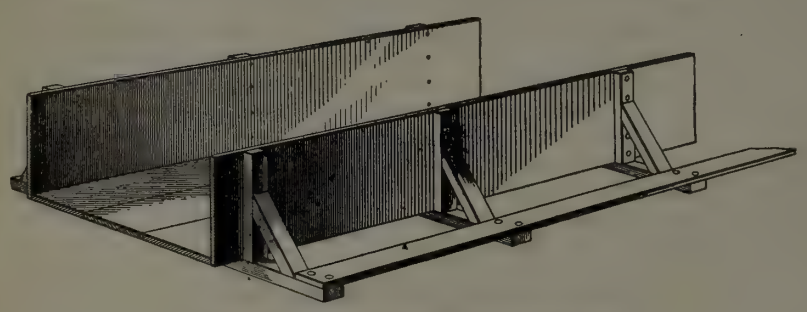
End view of V-shaped Flume

Timber flume construction and fluming are discussed in a bulletin just issued by the department of agriculture. The publication, which is written by the expert lumberman of the forest service, considers the subject from the practical standpoint of the logger who has to get his material out by these means.

The V-shaped wooden flume is held to be superior to the box or square-sided form, because it requires less water and, on the average, less repairs than the other type, is better adapted to act as a slide on steep grades, and offers fewer chances for jams. Concerning a third type the sectional metal flume, semi-circular in form, the prediction is made that it will eventually come into wide use. Such a flume is strong and light, and can be quickly taken apart and transported from one place to another to be set up again.

When building flumes a good plan, says the bulletin, is to erect a small sawmill at or near the upper end of the flume location to saw out the material needed for construction. Such material can be floated down the flume as fast as the latter is built and used for its further extension.

For handling railroad cross-ties, cants, poles, cordwood, and the like, a flume with the sides of the V 30 inches in height is large enough. For handling logs, piling, long timber, or brailed sawed

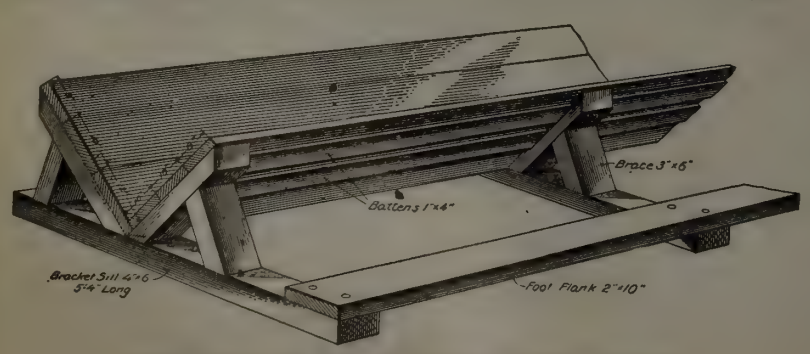


Common Form of Box or Square Flume.

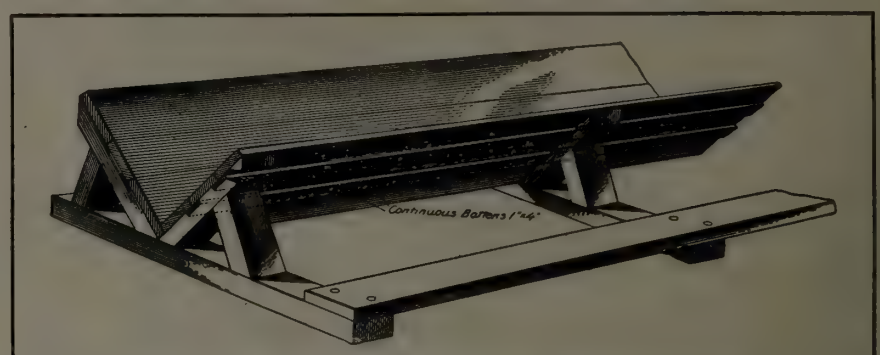
lumber, a height of from 40 to 60 inches is recommended. The best angle for the V is put at 90 degrees.

Flume lines should be surveyed with enough care to ensure evenness of grade. Grades should be kept below 15 per cent wherever possible, and the best results are obtained with grades between 2 and 10 per cent. A careful preliminary survey, followed by a location survey, using a transit and level, will make it possible to obtain a reliable profile map which will serve to show the prospective operator what the grading should be at different points along his line.

Abrupt curvatures in a flume should be avoided, for they are likely to cause jams. Curves should rarely be permitted to exceed 20 degrees. The longer the material to be handled in the flume, the less abrupt should the curvatures be. It may be necessary to blast



View of Flume showing dimensions of different parts.

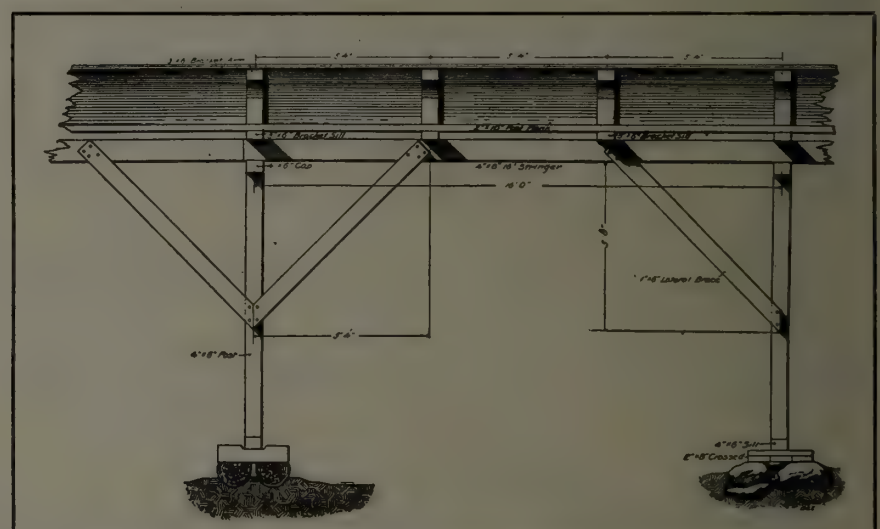


Side view of a Flume constructed with continuous battens.

out rocks and boulders, or projecting points of bluffs, or to trestle, or even tunnel, to eliminate abrupt curves or maintain an even grade.

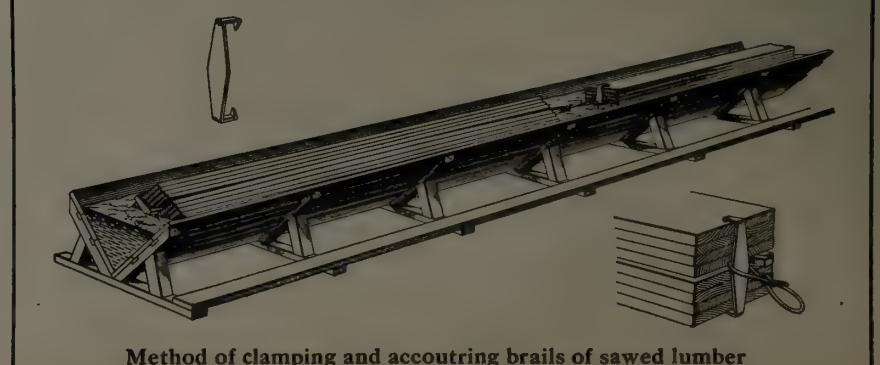
Some flumes are built with only the lining or inside of the box of sawed lumber, the brackets or frames which support the sides of the V being made from round pole wood flattened on one side, and the sills, stringers, braces and trestling of small round timber or poles. Sawed material is recommended for flume construction, however, wherever it can be obtained at reasonable cost.

The "boxes" or sections of a flume vary in length from 6 to 20 feet. Sometimes the boxes are made of only one thickness of boards, but more often of two thicknesses with the joints broken by varying



Side view of V-shaped Flume showing method of construction and lateral bracing.

the width of the boards. Sometimes, also, a single thickness of boards is used, with battens spiked over the joints on the outside in the sections between the brackets. In still another form the battens are continuous. On curves the boxes should be shorter than on straightways, and the bents, arms, and braces correspondingly closer spaced. In general, on curves of from 6 degrees to 10 degrees, the boxes should be jointed at least once in every 12 feet; on curves exceeding 10 degrees and less than 15 degrees, every 8 feet; and on curves of more than 15 degrees, at least every 6 feet. Very abrupt curves also require increased bracing, in addition to shorter spacing of the



Method of clamping and accoutring brails of sawed lumber together for shipment.

arms and brackets. Flumes should also be strongly reinforced at points where extensive shipping is to be done or much material loaded into the flume over the sides.

If the storage facilities at the lower end of a flume are not sufficient for all the material that can be handled during the period in the spring when melting snow and early rains furnish an unusual volume of water, the construction of small holding reservoirs or "catch basins" at different points along the line is recommended. These may be formed by damming up some small stream; or natural ponds, favorably located, may be used for the purpose. In this way such material as it is not necessary to handle clear through at once can be diverted temporarily. A small artificial pond or reservoir at the upper end of a flume in which to "land" or "bank" the material to be shipped is also advisable, especially when handling logs, crossties, or heavy manufactured material of any kind.

Telephones are recommended as adjuncts to the operation of a flume. By their use a serious break or jam can be reported immediately to the head of the flume to prevent further shipment of material. A telephone also makes it possible to notify the men at the upper end of the flume just what material to ship and when to ship it.

A flume recently built on Rochat Creek, near St. Joe, Idaho, is cited as a good example of modern V-shaped flume construction. This flume, which is unusually large and built to handle heavy logs and long timbers, is said to have cost approximately $8,000 per mile for the five miles, including the cost of constructing a wagon road and telephone equipment. Other flumes are cited costing from $2,000 to $7,000 a mile.

Toronto Lumbermen's Club Joins Board of Trade

A meeting of the Toronto Lumbermen's Club was held on Friday, July 3rd, at which it was definitely decided to affiliate with the Toronto Board of Trade. The Board of Trade have completed arrangements for securing the top two flats of the new Royal Bank Building at the corner of King and Yonge streets, where excellent accommodation will be provided for luncheon purposes and meetings. These quarters will probably not be available until about the end of November. It is expected that the lumbermen will form themselves into a Lumbermen's section of the Board, and in this way will be able to exercise a much greater influence upon matters of general importance to the trade than they could in any other manner. Until the new quarters are available, it is planned to hold weekly luncheons of the club at some hotel or restaurant, as has been done during the past few months. These meetings have all been well attended and the members are enthusiastic in regard to the proposal to join the Toronto Board of Trade.

Membership in the Board of Trade, for the balance of the present year will cost $6, and, after the first of the year, the fee will be $25 annually. Those who do not join before the first of January next, will be called upon to pay an initiation fee of $25 in addition to the annual fee. Those who join before that time will escape this payment. The indications now are that practically every manufacturer, wholesaler and retailer of lumber in Toronto, and many from outside points will join the Lumbermen's section of the Board of Trade. Application forms can be obtained from the secretary of the Board of Trade, or from the temporary secretary of the Toronto Lumbermen's Club at 220 King Street West, Toronto.

Vancouver Concatenation a Great Success.

The lumbermen of Vancouver made an excellent record for themselves as entertainers, during the recent convention of the Pacific Ad. Clubs in that city. The convention took place on June 11th and 12th and was largely attended. A magnificent pageant was arranged by the lumbermen of the city of Vancouver in which many other industries and neighboring municipalities took part. Everything from doors to bungalows and large timbers were shown in the lumber floats. In the evening a record Concatenation of Hoo-Hoo was held at which J. G. Robson, Vicegerent Snark for the western district of British Columbia, presided. No less than forty-seven kittens were put through the test and admitted. Those who were in charge at the Concatenation were:—

Snark—L. R. Fifer, Seattle, Wash.
Senior Hoo-Hoo—Ed. McDonald, Vancouver, B.C.
Juniors Hoo-Hoo—George Cornwall, Portland, Ore; T. M. Shields, Seattle, Wash.
Bojum—W. P. Lockwood, Seattle, Wash.
Scrivenoter—Paul E. Murphy, Vancouver, B.C.
Jabberwock—P. V. Fau Vel, Vancouver, B.C.
Custocatian—J. Charles Dietrick, Vancouver, B.C.
Arcanoper—J. V. McNaulty, Vancouver, B.C.
Gurdon—L. E. Snell, Vancouver, B.C.
The following is the list of the kittens:

The Kittens

E. W. F. McMullan, Bradner; D. J. O'Donnell, Eburne; E. L. Munroe, Vancouver; F. C. Armstrong, Vancouver; R. P. Stewart, Vancouver; E. V. Saskett, Vancouver; H. J. Sheehan, Vancouver; A. L. Johnson, Vancouver; R. E. Greenwood, Vancouver; Gilbert Warren Hayes, Vancouver; Mark Richardson, Vancouver; F. C. Taylor, Vancouver; J. F. Fravel, Edmonton, Alta.; S. V. Trapp, New Westminster; D. B. Campbell, Vancouver; George Elley, Vancouver; Harold Bradley, Vancouver; G. E. Wilton, Vancouver; John Hanson, Vancouver; Otto Westendorf, Elmore Station; J. A. McMillan, Vancouver; David H. Loughud, Elmore Station; A. G. Kidd, New Westminster; C. E. Dorman, Vancouver; H. R. Mackenzie, Port Moody; W. B. Cutler, Port Coquitlam; Charles Firth, Vancouver; Thomas Millard, Vancouver; G. W. Rittman, Vancouver; E. P. Demens, Vancouver; R. E. Madland, Vancouver; T. D. O'Connell, New Westminster; H. E. Benner, Vancouver; W. D. Raven, Fraser Mills; G. A. Kirk, Vancouver; E. J. Conner, Vancouver; P. K. Mackedie, Vancouver; R. T. Philbin, Vancouver; E. T. McLennon, Vancouver; Albert Fraser, Vancouver; C. T. Rollston, Vancouver; W. E. Ruemelin, Vancouver; W. H. Nelson, Vancouver; A. S. Fox, Vancouver; H. A. Cheever, New Westminster; N. R. Whitlall, New Westminster; Thomas McLarty, Eburne.

Canal Charges on British Columbia Shipments

The rate established for carrying cargo through the Panama Canal, $1.20 per ton, is regarded by shipping companies on the North Pacific coast as sufficiently low to result in great benefit to British Columbia in the transportation of products of the Province to the Eastern markets, says a recent United States consular and trade report. This is especially true of copper and other minerals. The toll assessment is made on the basis of the vessel ton, the standard measure of which is 100 cubic feet of space, and not on a shipping ton of 2,240 pounds. The canal toll charges will therefore add a comparatively smaller amount per net ton weight to the freight rate on commodities of lesser bulk than on those occupying greater space.

The following tabulation of 18 articles which will figure largely in canal shipments from British Columbia shows the number of cubic feet of bulk of each item per actual ton, the number of shipping tons (2,240 pounds) to each vessel ton, and the toll per shipping ton, on the basis of the Government toll of $1.20 per 100 cubic feet.

Articles	Cubic feet per long ton.	Number long tons per vessel ton.	Added charges (minimum) per long ton.	Articles	Cubic feet per long ton.	Number long tons per vessel ton.	Added charges (minimum) per long ton.
Lead	8	12.50	$0.096	Wheat	47	2.13	$0.564
Copper	18	5.55	.216	Oats	70	1.43	.840
Zinc	87	1.15	1.044	Lard	60	1.66	.720
Cement	40	2.50	.480	Beef (tierces)	60	1.66	.720
Coal (average)	45	2.22	.545	Sugar	47	2.13	.564
Oil (average)	56	1.79	.670	Hides (green)	35	2.85	.420
Lumber (yellow pine)	42	2.39	.504	Hides (dry bales)	85	1.17	1.020
Wood pulp (rolls)	114	.88	1.368	Whalebone	130	.76	1.560
Paper	70	1.43	.840	Tiling (clay)	100	1.00	1.200

It should be carefully noted, however, that the amount of tolls charges per weight ton of cargo as here given does not represent the actual additional charge that will be made by the steamship lines on account of the canal tolls. Every vessel passing through the canal carrying any cargo at all must pay the same tolls as if it were fully loaded, the charge being made on the vessel itself and not on the cargo, and being paid by the owners of the vessel. The amount added to the shipping rate on account of the canal tolls will therefore be higher than the figures given, which assume that every ship is loaded to capacity.

Court Reverses Timber Limit Judgment

The Court of Review, Montreal, has reversed the decision of Mr. Justice W. A. Weir in the action brought by Mr. E. J. Rainboth, surveyor, of Ottawa, against Mr. J. O'Brien, railway contractor, for a quarter interest in timber limits, valued at $2,000,000, in the district of Pontiac, P.Q. The plaintiff based his case on a covenant entered into with O'Brien in 1901, wherein the latter had undertaken to retain the services of Hon. Rodolphe Lemieux, K.C., to acquire for both O'Brien and Rainboth, by private sale from the provincial government, the rights to the timber limits involved. The limits had been put up for sale by the government and it was stipulated in the Rainboth-O'Brien agreement that the price to be paid was not to be greater than the upset price fixed by the provincial authorities. Hon. Rodolphe Lemieux, however, failed to put the deal through, but some time later M. J. O'Brien secured the rights of the limits. A few years later plaintiff commenced an action demanding a quarter interest, by virtue of the agreement. Mr. Justice Weir gave judgment for him, condemning Mr. O'Brien to pay $500,000 should he fail to account to plaintiff for the quarter interest. The Appeal Court, in reversing the judgment, found that Hon. R. Lemieux having failed to carry through the deal, the agreement between the parties was at an end. It was also held that the conduct of the plaintiff subsequent to the failure of the deal and his long silence up to the commencement of the action showed that the defendant's plea was well founded. Plaintiff's action was therefore dismissed with costs in both courts.

Commercial Importance of Douglas Fir

The Great British Columbia Timber Production of Which is Rapidly Increasing —Its Wide Variety of Uses in East and West

By R. G. Lewis

B. C. Douglas Fir

It is only within comparatively recent years that the commercial woods of the Pacific Coast have begun to invade the eastern markets. During that time Douglas fir has won for itself a place among the most important woods of Canada. During 1912 a total of 889,861,000 board feet of this material was sawn into lumber in Canada, forming over a fifth of all the lumber produced in that year and holding third place on the list. The production is increasing relatively to the other woods and will undoubtedly surpass that of white pine in a few years, as the existing supplies of that wood disappear.

The natural range of the tree in Canada is confined almost entirely to the province of British Columbia. Small quantities of the wood are sawn in Alberta from the east slope of the Rockies, but these are of no commercial importance. To the south, in the United States, the tree is found in commercial quantities through Washington, Oregon, California, Idaho and Montana, and grows as far south as Mexico. In British Columbia, the tree is known to occur as far noth as latitude 55, although its northern limit has not been accurately established. Douglas fir reaches its highest development near sea level in southeastern British Columbia.

No tree surpasses this in symmetrical form of trunk and few equal it in size. Larger timbers are sawn from Douglas fir than from any other tree in America with the single exception perhaps of California redwood. If we consider that, in Canada, spruce is cut from at least five different species and white pine from two, it is probable that no other single species furnishes as much of Canada's lumber at the present time. In the United States, in 1912, the wood came second only to the hard pines from the southern states and these are cut from as many as ten species; so, Douglas fir furnishes much more than any other single species in that country.

The Largest Tree in Canada

Douglas fir (Pseudotsuga mucronata) is the largest tree in Canada and reaches, under average favorable growth conditions, a height of 180 to 190 feet, and a diameter of 3½ to 6 feet. It is long lived; one tree eight feet in diameter showing an age at the stump of 435 years, and the average of mature timber being 200 years.

The wood is variable in texture, color and hardness, depending on differences in soil and moisture conditions, and rate of growth. Old, slow growing trees produce wood that is soft, fine grained and straw yellow in color. The wood of fast growing trees is harder, coarser and darger in color. These differences have given rise to the names "yellow fir" and "red fir" among the lumbermen, and by many it is believed that two distinct species exist. The fact that "red" and "yellow" fir can be sawn from the same tree shows that the differences depend entirely on different rates of growth.

The wood of Douglas fir is strong, straight grained, fairly resilient, resinous and fairly hard for a coniferous wood. The lumber is difficult to season without causing case-hardening, difficult to nail without splitting and liable to such defects as pitch seams and twisted grain. When sawn with a flat grain the wood shows an attractive figure and can be stained to imitate more costly woods. In the Western States the wood is sometimes stamped to imitate quartered oak.

In British Columbia and the Pacific Coast States, this wood is used for almost every purpose to which a softwood could be put. To enumerate these uses, which depend on the cheapness and abundance of the wood rather than its qualities, would be of no value in explaining the uses for which it is specially fitted.

Used Most Extensively in Rough Construction

Douglas fir is used in greatest quantities for rough construction work such as, bridge building, wharf construction, and the building of heavy framework of all kinds. It is used in the round for mining timbers and piling, and its use for these purposes depends on its strength, lightness and the dimensions in which it can be obtained clear of defect. More Douglas fir is used in mining operations in Canada than any other wood, large quantities of dimension stock being used for "square setting" in metal mines.

Fir trees form over ten per cent. of all those purchased by Canadian railway companies in an average year, and many poles of this material are also used. The use of the wood for cooperage is restricted by the strong resinous odor and taste that the wood imparts to the contents of the barrel. This resin is difficult to "kill" and when the wood is used for barrels to contain alcohol or food stuffs the barrels must be parafined.

In eastern Canada, Douglas fir is used in greatest quantities by boat manufacturers for planking tugs and wooden steamers and for building heavy barges and scows. Spars for all kinds of vessels are made of this wood which is now preferred to all others for this purpose on account of the superior form of the tree combined with the good qualities of its wood. The wood competes with the imported hard pines for beams and spars of derricks, and for the frames of dredges, pile drivers, and all marine structures.

The next most important use of this wood in the east is in the manufacture of railway rolling stock. Douglas fir can be used in every part of a car from the roof to the sills but as a rule its use is confined to the long body sills and to roofing and siding in freight and baggage cars. In the Maritime Provinces, this wood has been driven out of the market for this purpose, by long-leaf pine which can be sold at a lower price on account of the closer proximity of the supply, but its use in Ontario and Quebec is very extensive.

A Favorite Western Building Material

The use of fir for building material is of course much more universal on the Coast than in Eastern Canada. On the Prairies large quantities are purchased for sash, doors, framing, flooring and interior finish. Further east its use is confined to framing and occasional decorative panel work. On the Pacific Coast, edge grain Douglas fir flooring is valued above all other woods native to the country, and is everywhere considered superior to any other American softwood. For most interior decorative work the resin in the wood must be "killed" by careful seasoning. Panels for walls or door panels are sometimes made of rotary sliced veneer. The logs must be steamed for about three days before being put on the veneer lathe but the resulting tough veneer with its odd, attractive figure, well repays any trouble taken in its preparation.

For all kinds of cabinet work, fir is used to some extent in the west, and while it is cheap and abundant, it serves the purpose well enough for the cheaper class of products. In eastern America there are so many cabinet woods that are immensely superior to it that its use is comparatively rare.

Durable and Impervious to Water

The relative durability of the wood and the fact that it is practically impervious to water has been responsible for its use for making wooden pipes. Continuous stave and jointed conduits are used to an enormous extent in the west in power, mining, and irrigation projects, as well as for water supply pipes for cities and towns. The smaller pipes are made in standard lengths and are usually wound with mild steel wire and coated on the outside with some asphalt or tar preservative, their staves being made of flat grained lumber and grooved at the edges. Larger pipes are usually put together in the place where they are to be used. Their construction is continuous, the staves being placed so as to break the joints. The staves of these larger pipes are not grooved but merely bevelled at the edges and the pipes are made watertight by drawing the staves together with steel bands and bolts. The use of fir in this industry is closely connected with its use for silos, wooden pumps and tanks for water, brine or chemicals.

Douglas fir is often preferred to hard pine for lock gates on account of the large dimensions obtainable, for gates at railway crossings, machinery framework, elevators, cross-arms, flag poles and scaffolding.

Some of the less important uses of this wood include:—poles, reaches and body work in vehicles, saddle trees, hay and stock racks, well drilling machinery, agricultural implements, portable poultry houses, fencing, spokes and arms of transmission pulleys, foundry flasks, cement pipe jackets, pike poles and windmill pump rods.

The utilization of sawmill waste of Douglas fir in the manufacture of turpentine is still in the experimental stage in this country. Wood containing a large percentage of pitch is selected from

the waste at a mill and this is distilled, yielding turpentine, pyroligneus acid, tar oils, wood creosote, pitch and charcoal. The yield depends on the resinous content of the wood and as this is very variable the yield is also very variable. One of the chief obstacles to the development of this industry in the West is the uncertainty of the market for the products.

Douglas fir pulp is sometimes used on the Coast for the manufacture of book and magazine paper being mixed with pulp made from black cottonwood to give this the requisite strength.

An Excellent Paving Block Material

Fir paving blocks have always been popular in British Columbia and the western United States and are becoming more popular in the east. The blocks are given a heavy treatment with some preservative, usually creosote or coal tar, and are carefully laid on a firm foundation of concrete. The failure of many wooden block pavements can be attributed to improper methods of laying and careless work in this respect has been a bad advertisement for this class of pavement. A well laid creosoted Douglas fir pavement is practically indestructible and the softness of the wood and its resiliency make it noiseless, dustless and safe for all kinds of light or heavy traffic.

The preservative treatment of this wood has always been a difficult operation. Seasoned wood is hard and refractory and cannot be treated economically by a pressure method. Most of the wood is now treated when in the unseasoned state by a method which combines seasoning and treating in one operation.

It would be a waste of time to enter into the pros and cons of a long drawn out controversy that has been going on for many years as to the relative strength values of Douglas fir and long-leaf pine. If the differences between the two woods are so small that they can give rise to an unsettled controversy they cannot be of much importance to the manufacturer.

British Columbia Lumber at Glasgow

On account of established custom the credit due to imports into the Clyde from British Columbia is not given, from the fact that all the lumber imported is sold as Oregon, says a recent Trade and Commerce report. The desire, however, is to give to British Columbia lumber a preference so far as market conditions will permit. The limited trade with British Columbia is not due to goods being obtained elsewhere, but from the quietness of business generally, and the demand being anything but active.

The following figures may be of interest:—

Oregon Pine, Logs and Planks

Year	Imported to Clyde.
1911	253,850 cubic feet
1912	571,050 cubic feet
1913	360,000 cubic feet

At March 31, 1914, there was in stock, decks 29,279 cubic feet, logs and planks, 357,864 cubic feet. This quantity is looked upon as being too large.

It is thought that the opening of the Panama Canal will improve the prospects of British Columbia trade and that this lumber will in a measure displace pitch pine from the Southern States. Time and freight has been against British Columbia, but the prospects for future business are good; an active and aggressive campaign will bring results, as buyers here all express the hope that British Columbia will come in for a much larger share of the trade.

The undernoted are the recognized sizes used:—2½ x 5 full, 3 x 5 full, 20 foot and up long—average 26 to 27.

Clear lumber free from sap and all other defects. These are used largely for ships decks.

Three-inch to 6-inch and up, length 12 feet 0 inch used principally by sawmills.

Long square timber 50 to 70 feet by 15 to 20 inches square, also 12 inches square.

The general opinion is that the opening of the Panama Canal will enable business to be done by cable, in order to avoid the expense of carrying stocks. It would be well for British Columbian shippers to take up matters energetically for the future. Buyers here must have some guarantee of probable time of arrival of their purchases; delay of shipments will hinder business.

British Columbia Lumber in South Africa

According to a report presented by the Canadian Commissioner at Cape Town, South Africa, under recent date, the total import of lumber into South Africa in 1913 was valued at £1,220,814 and the import from Canada amounted to £59,732, but there is no record of the proportion supplied by British Columbia. It is probable, however, that three-quarters of the imports of Canadian lumber are from that province, and practically all of this is bought by two firms whose orders go through their London houses or San Francisco agents.

Four months ago there were sent forward and published in the Weekly Report, fifty-three trade inquiries for lumber. This resulted in bringing to the Department 148 inquiries from Canadian producers and out of these there were only three British Columbia firms who asked for information.

With regard to the possibilities of an increase of trade to South Africa from British Columbia on account of the opening of the Panama canal, it is impossible to form any definite opinion as to the immediate future, as no doubt shipment will take place to the nearer markets where a larger mileage is saved.

The larger demand is for a pine shelving 12 inches wide, also for flooring and ceiling. The one essential for a sure and growing trade is some method of official grading such as is used in Sweden; if an official inspection cannot be arranged, let any firm or firms who are anxious for an export trade circularize the trade in South Africa, quoting c.i.f. at any of the ports—Cape Town, Mossel Bay, Port Elizabeth, East London, Durban and Delagoa Bay—and in this letter state plainly the qualities in various grades, and if prices are right, trade is sure to result. The trade buy all qualities; what they want is an assurance that when they order a certain grade they are sure to receive it. Sweden commands this trade and there is no doubt her grading helps her. The grades as accepted from Sweden allow as follows:—No. 1 permits a very few small hard knots. No. 2 permits of a few more than No. 1. Nos. 3, 4 and 5 grade according to the number of knots whether loose or tight. Nos. 4 and 5 also allow wane, shake and almost all faults.

Baltic lumber is not officially graded but certain firms have established a good reputation for standard grade shipments and in consequence Norway is one of the largest shippers to South Africa. There is another quality for which Baltic lumber gets credit by those handling it and that is, it is more easily worked than any other lumber, however, from the many inquiries made for Canadian lumber, it is quite evident the South African trade is anxious for it, if it can be bought under as good conditions as from any other country.

China Needs Railway Ties from British Columbia

A Canadian creosoting company of Vancouver, who produce creosoted Douglas fir ties, state that they are forwarding sample ties to the office of the Trade Commissioner at Shanghai, and quoting prices. The Shanghai-Nankink Railway is interested in the sleeper question, and wants information as to the length of service and c.i.f. prices Shanghai of Douglas fir sleepers, as they will shortly be in the market for sleepers. It is hoped that business will result and be the entering wedge of a large trade with China in railway ties.

The British and Chinese Corporation, who built and own the S. N. Railway, have been recently granted a concession by the government to build a further 1,000 miles of line in extension to the west, and the S. N. R. are also taking over the construction of a line to Ningpo from the Chinese. Ties both for the S. N. R. and the Ningpo line, and possibly the line to the west, will be required, and it is hoped that the sample tie and the price quoted will make a favourable impression.

Other firms might be invited to quote prices for ties c.i.f. Shanghai, both creosoted and uncreosoted.

First Timber Shipment by Panama Canal

A report from Vancouver, B.C., says that a ninteresting shipment of fir has just left the west coast of British Columbia for use in harbor developments in Toronto which the Dominion Government is carrying on. The freighter Robert Dollar carries a shipment of 4,845,000 feet which is said to be the largest timber cargo ever shipped from a B.C. port. In transshipping on the Atlantic coast it will take approximately 165 cars to receive it. It is expected that arrangements will be made for the freighter to pass through the Panama Canal.

Summer Resorter Dislikes Logs

The question whether a lumber company has the right to obstruct a river with its logs and thus prevent a summer resorter from sailing thereon, is in issue in the case of the Holt Timber Company versus Iveson, which was argued before the Supreme Court of Canada recently. The lumber company owns timber in the district of Parry Sound, Ont. In order to market the timber, it must be floated down the Magnetawan River to Byng Inlet on Georgian Bay or down the south branch of the river to the Canadian Northern Railway station and there loaded on cars. In 1912 the mill as Byng Inlet was burned and the logs had to be sent to the station, where a lifting machine known as a jackladder had to be constructed to get them on the cars. Mr. Iveson, who owns a cottage at this point, claimed that the jackladder encroached on his land and that the river was so obstructed by logs as to prevent his sailing on it. The trial judge held that there had been encroachment, awarded him $15 damages and granted him an injunction against unnecessary obstruction of the river. The case was then appealed to the Supreme Court.

Chemical Utilization of Wood Wastes

Outline of the Methods at Present Available for Converting Material into Products of Marketable Value—Report by Forest Products Laboratories

A bulletin upon chemical methods for utilizing wood wastes, prepared by W. B. Campbell, B.Sc., of the Forest Products Laboratory, has been published by the Department of the Interior. After referring to the great quantity of wood taken out of the forests, which never is converted into a marketable product. The bulletin says:

Much has been done by the lumbermen themselves through their various associations to make an asset of many forms of waste wood. This work has been mostly along the lines of using up the small pieces produced by the mills which can be used to advantage by other mills, which do not necessarily require that their raw material be in large-sized sticks. Box factories, spool manufacturers, toy makers and factories making such articles as hammer-handles, etc., are frequently able to use the odd pieces produced in the manufacture of larger articles.

But the vast quantities of shavings, sawdust and edgings mostly go to waste yet, and to these is directed the attention of chemists all over the world, since chemical utilization seems to be the most promising field in this connection.

The object of the following brief statements is to present a synopsis of some of the results already obtained, without going into the details of any of them. While all of these various industries have proved successful—that is, profitable—it should be recognized from the start that in each case much preliminary investigation is absolutely necessary, for what is successful in one locality may prove to be complete failure in another. Most of these industries require a large and constant supply of raw material, expert technical supervision, and frequently a considerable outlay of capital for expensive equipment. The market also has to be considered, particularly in its relation to the particular locality in which the raw material is found. When these conditions are found to be favorable after proper consideration, then it is well worth while going further into the matter.

Manufacture of Pulp and Paper

The manufacture of pulp and paper from wood is an industry which has proved itself stable and of increasing magnitude for a number of years. Almost every kind of wood has been proved suitable for the manufacture of some form of paper, but there are considerations affecting the use of each kind which must always be observed. Most of the pulp is made from the wood cut specially for the purpose, but almost any wood can be used, provided that it is reasonably free from dirt, knots and bark, or that these can be easily removed from it. Sawdust is an exception to this rule on account of the fact that the fibres are cut so short that the pulp produced will not felt properly and the cooking is made considerably more difficult. There are several mills in the United States at present using mill-slabs, shavings and other forms of waste more or less entirely. The advantages of waste wood are, of course, its cheapness and its quantity. There are several disadvantages. It is usually green and full of water, has a large percentage of bark and comes in irregular shapes. Shavings are rather better for the purpose, and, if in sufficient quantity, make very good raw material. Another point to be taken care of in using waste material such as this is, to use the raw material of only one species, or, at least, species sufficiently alike that they may respond to the same treatment. For instance, on account of the relatively large content of resin in long-leaf pine, it will do to treat this in the same way as spruce. Neither will it be satisfactory to work hard and soft woods together in any one treatment, though any of these can be worked satisfactorily if kept separate. The process to be used will depend chiefly on the raw material at hand and on the market for any particular variety of pulp.

Hardwood Distillation

The distillation of hardwood, with the resultant production of charcoal, acetate of lime and wood alcohol, is an industry which is well developed and pretty stable. The latter two products are regularly quoted market articles. Charcoal is usually disposed of locally for domestic purposes, unless there is a charcoal-iron furnace within shipping distance.

Besides the wood cut especially for the purpose, hardwood slabs and other odd pieces of hardwood can be used. Where the wood is not cut especially for distillation, the plant is usually run in connection with a sawmill, so that only the part not suitable for lumber is used for the distillation. Almost any hardwood in pieces three or four inches in length and upward is suitable, but sawdust and shavings are not suitable—firstly, on account of the fact that the small size of the material makes it such a poor conductor of heat that it is impossible to char it completely in the ordinary forms of apparatus used, and, secondly, because the charcoal produced is so finely divided as to make it difficult to cool and handle, and because there is no market for it.

The woods most frequently used are beech, birch and maple, with smaller amounts of other woods as they may occur with the first-mentioned.

Resinous Wood Distillation

The development of the industry of distillation of resinous, or "soft" woods for the production of charcoal, wood creosote and turpentine, is much later than that of distilling the hardwoods, and the practice is not yet standardized to any great extent, though a great deal has been done along this line in the last few years. The value of a resinous wood for distillation is in proportion to the amount of resin, or "pitch," contained in the wood. This resin content is quite variable, even in trees of the same species and in different parts of the same tree, so that some care is necessary in the selection of the wood for distillation to avoid using wood which is too lean to yield a profit.

Pine is the wood most used and is taken mostly in the form of "lightwood." Stump-wood is also used to a considerable extent, but is usually left to the last, since it is much harder to collect and handle. Almost any kind of resinous wood is suitable to some extent, the only question being whether it contains sufficient resin to make the recovery worth while, and so is largely a matter to be considered in connection with the particular location in question. Where sawmill waste is used, the matter of selection is not so important, as the cheapness of this material makes up, to some extent, for the poorer material. This class of material, however, is not rich enough to render the more complex and expensive processes feasible, and the simpler and more rapid steam-distillation processes must be used. This recovers only the volatile oils which were originally present in the wood, and so the process is very wasteful, but is the only one at all successful with this class of material. Destructive distillation plants for resinous wood are the cheapest form to construct. They produce products of rather poor quality, however, and so the market is somewhat restricted. There are also some processes known as "bath processes" in operation. In these the wood is run into a retort and flooded with some high-boiling solvent of the turpentine and light oils. These are heated and extract the oils from the wood, and are then drained off and the oils recovered from the solvent by distillation with steam. Various solvents are used, but rosin appears to be the best at present.

Processes using a low-boiling solvent, such as naphtha, have found increasing use in the last few years, but the decreasing price of turpentine and the increasing cost of solvent has made the business increasingly difficult.

Tanbark and Tanning Extract

Tannin is obtained from the leaves, bark and wood of a great many trees, but only a few of these (practically only hemlock and a couple of species of oak) are used commercially. Usually these are sold in the form of bark and the tanners make the extract themselves. In some cases, however, it may be of advantage to make the extract nearer the bush and save the freight on the bulky bark. The method of extraction is very simple and the extract can easily be concentrated and shipment made easy.

Manufacture of Ethyl Alcohol

This is a process for the manufacture of ethyl (or "grain") alcohol from wood as distinct from the methyl (or "wood") alcohol produced by the destructive distillation. Ethyl alcohol is not poisonous in the same way as wood alcohol, and a very broad market is open for it, if production is made sufficiently cheap. Since the wood used in this process must necessarily be finely divided, almost any kind of waste wood is suitable as the large-sized pieces can be easily reduced to the proper size.

The process used consists of the conversion of the cellulose of the wood into a sugar; the sugar is then fermented to produce the alcohol and this is distilled off. The process is on a paying basis in Europe, and in at least one plant in America.

Cattle Food

Cellulose, or wood fibre, may be converted—at least partially—into a sugar, with comparative ease. There are also several other carbohydrates formed in the process. A considerable proportion of the products so made are digestible by cattle, and, especially when mixed with other products, such as peanut meal, rice meal, alfalfa, it seems to make good cattle food and finds a market.

Manufacture of Oxalic Acid

Finely ground wood fused with caustic soda forms sodium oxalate from which oxalic may easily be produced. The manufacture

of this product may prove profitable, though the restricted market would be against it. A very little wood used in this way would produce all the oxalic acid used in the country. Almost any species of wood is suitable.

Waste Wood for Producer Gas

Several forms of apparatus for the production of producer gas from waste wood have been put on the market lately and are finding considerable favour. The production of power from waste wood in this way is much more economical than burning the wood under steam boilers, especially when small-sized stuff, such as sawdust and shavings, are to be disposed of. The commercial success depends on the demand for the power produced. Any kind of wood can be used, though it is an advantage to have it of fairly uniform size and perfectly dry. The woods with the higher calorific values are, of course, somewhat more efficient.

Further information regarding any of these methods will be gladly supplied by the Forest Products Laboratories, McGill University, Montreal.

Advises Holding Growing Timber

Forestry Expert Tells B.C. Lumber Corporation to Retain Their Limits and Wait for Increased Value

An interesting address upon the timber resources of British Columbia, with special reference to those of the British Canadian Lumber Corporation, Limited, was delivered at the annual general meeting of shareholders of this corporation by Dr. S. B. Sinclair, formerly lecturer at Macdonald Agricultural College, Ste. Anne de Bellevue, P.Q. Dr. Sinclair has been a close student of forestry conditions on the American Continent for many years.

"My investigations during the past year," he said, "have lead to three conclusions; first, the standing timber of the British Canadian Lumber Corporation at the present time is worth at least $1.50 per M.; second, it would be unwise to sell before two years; third, there is special need of co-operation on the part of all.

"For a number of years distinguished foresters, notably Fernow and Pinchot, have pointed out that the amount of standing timber is steadily increasing. There has been considerable uncertainty and difference of opinion regarding the supply of lumber, owing to the lack of reliable scientific data. The Washington Bureau of Labor and Commerce of the United States published, in January of last year, the results of a comprehensive and methodical investigation of the amount of standing timber in the United States, its value and the general outlook for the future. We have now a report which is generally admitted to be fairly accurate as far as the United States is concerned, and it is largely upon the findings of this report that my conclusions are based.

After referring to the total stand of timber in North America and to the prevention of forest fires, Dr. Sinclair said:—"There is universal agreement amongst forestry experts that those who own standing timber and can hold it till the supply in other parts of the country is gone, can ask and get their own price. Corporations who know the situation and are able to hold and wait for this time are doing so. For example, three holders, the Southern Pacific Company, the Northern Pacific Company, and the Weyerhaeuser Timber Company, together own nearly ten per cent. of the entire standing timber in the United States and the Washington report says: 'The first two are not cutting any timber, and the third only a comparatively small amount.'

"Fifty per cent. of the standing timber of the United States is found in California, Oregon, Washington and Idaho, but over four-fifths of the present cut of lumber is from the timber in the Eastern States. It is estimated that the Southern pine will be practically cut out in seven years. My observation is that the period will be shorter.

"In the Eastern States the price is high and the rise so small that there is a rapid cut. In the Pacific North West the rise promises in most cases to equal a high rate of interest and accordingly the cut is small.

"Speaking of the forests of Oregon and Washington the report says: 'Their price is low as yet, partly because the freight rates to the markets are so high, but they will sooner or later play an overwhelmingly important role in the lumber markets, and their importance will, in all reasonable probability, be attested by an enormously increased price.'

"The report gives the results of two hundred and sixty-six returns on the stumpage value of Douglas fir and says: 'In the Coast and Puget Sound sections of Washington State, the great centres of Douglas fir lumber production, the extreme stumpage prices quoted were fifty cents and five dollars per M., with an average of about $1.75 per M.'

Upward Tendency of Stumpage Values

"'Stumpage values have, at intervals, come to a standstill temporarily, but the tendency has been steadily upward and no advance has ever been lost. There has been no retrogression except on the manufactured product. This has been uniformly and invariably true; depressions in the lumber market have at times lessened transactions in timber lands, but no decline from fixed valuations has ever been recorded.'

"In this connection, a prominent mill-owner in Western Oregon informed me that, owing to the low price of lumber, he had run his mill at a loss during the past year. His timber supply being sufficient for only six more years, he found it necessary to look for new timber limits and he found to his surprise that it was impossible to secure anything of standard quality for less than $2.50 per M. The Washington report places the price of Western Oregon timber below that of Puget Sound near your limits.

"In so far as I could learn the situation in British Columbia is similar to that in Oregon and Washington. There is a temporary lull in milling operations, owing to the general business depression. Except in the case of companies, however, who are compelled to sell to avoid liquidation, it is impossible to buy timber such as that owned by your company for less than $1.50 per M.

"In estimating the value of standing timber the following points are to be considered—species, quality, logging conditions, freedom from danger from forest fires, accessibility to mills and market and neighboring holdings.

Dr. Sinclair spoke of the average value of timber upon the British Canadian Lumber Corporation's limits and, in conclusion, said:—"Speaking generally slow growth produces good lumber, rapid growth poor lumber. The average growth of good pine is about one inch diameter in seven years. The Southern pine of the United States has been grown in less than fifty years. Your timber has taken more than three hundred years to grow and could not be produced in a shorter period. The supply of the highest grade timber, such as I saw in your Vancouver and New Westminster mills, is limited to a small area in America.

"The opening of the Panama Canal promises a reduction of about fifty per cent. on freight rates to the Far East, a most important consideration for higher grade lumber.

Depression Followed by Rapid Advance

"There was general depression in the price of timber lands from 1896 to 1900 and this depression was succeeded by a rapid and continued rise. For example, a tract of Mississippi land of seven thousand acres was offered in 1899 for $5 per acre and was refused. It was sold in 1906 for $22, and in 1907 was bought at $30 by the company that refused to pay $5 eight years before. The weight of evidence is that the general increase from 1897 to 1907 was threefold, and there is reason to believe that during the next ten years history may repeat itself.

"In the light of foregoing facts it would seem unwise to sell (unless under compulsion) for several years to come.

"In my opinion, it is important that every shareholder inform himself as fully as possible regarding the genuine value of your assets. It is also desirable that nothing be said or done to depreciate this value, that all realize that a few years of patient waiting will probably be necessary, and that all stand loyally together in their efforts to cope with the present depression, which bids fair to be of but short duration."

Forestry Magazine Will Study Lumbering Problems

Having inaugurated a policy of keeping in the closest possible touch with the forestry and lumbering problems in the chief forest regions of the United States and Canada, the American Forestry Association has arranged with E. T. Allen, of Portland, Oregon, Forester of the Western Forestry and Conservation Association, to assist it in presenting through its magazine, American Forestry, those of the Pacific Coast. These are the problems which face the owners of the forests, those who cut, manufacture and market the lumber, and those who wish to secure the best use of the forests and their products. Mr. Allen is thoroughly well informed regarding the Pacific Coast conditions and his wide knowledge of the subject and his grasp of future possibilities will enable him to render valuable aid in this important work. This series of articles, now being prepared, for American Forestry, will treat of every important phase of forest and lumbering conditions, and they will give to the general public a knowledge of what the forests of the western coast mean to users of lumber,—such a knowledge as comparatively few people now possess.

Hydro-Aeroplane Flights at Canadian National Exhibition

Visitors to the Canadian National Exhibition this year will have the opportunity of witnessing hydro-aeroplane flights. Arrangements have been made whereby W. A. Dean will fly his machine daily, starting from the lake and circling over the Exhibition Grounds. There flights will be given at various intervals during the afternoon, but one will be held at the fixed hour of six o'clock every day. A sufficient height will be maintained over the grounds that in case of accident there will be time and room to glide out over the water before descending.

Three Types of Business Management

Third of Three Articles Analyzing the Composition of the Manager's Policy—the Efficient Type

By E. St. Elmo Lewis*

THE efficient manager has one object constantly before him—the elimination of waste. He realizes that every bit of material in his place can be used at 100 per cent. efficiency or less; that every bit of energy that he pays for can be used at 100 per cent. efficiency or less; and that time can be used in the same way.

He knows that things do not happen, that there is a cause for every effect.

He knows also that men can be taught, for he is teaching them. He knows that stenographers in an office can be taught accuracy, speed, English, or how to write a letter. He takes from his department manager the time wasting job of acting as primary school teacher to his stenographers.

He knows that foremen should simply supervise, they should not be expected to teach men the best ways of doing work. He knows that men vary in capacity, but he knows also that men learn to do better work at twenty-five than they did when they started as apprentices; that the best men have a certain way of doing things that can be taught to others, and therefore a plant can be taught how to increase production. It is a question of analysis, planning and executing. Therefore he goes at the proposition of raising efficiencies in a definite, concrete, tangible way, something like this:

Analyzing Efficiency Factors

1.—He makes time studies of the work.

2.—He places these studies in the hands of trained thinkers and scientific men who plan the work and fit the schedules.

3.—He establishes the idea of functional foremanship.

4.—He makes improvements in shop methods necessary to get the greatest possible product from the worker.

5.—He puts a wage system at work that will place a premium upon a man who exercises the greatest efficiency. A big problem? Of course it is, but it must be solved as nearly as may be, must it not? Its bigness does not affect its pressing call for a solution.

The efficient manager, after analysis, adopts a plan starting with the Taylor System, or the Emerson System, or any of many, which all come under the general term of scientific management. He starts from somewhere to go somewhere in his management.

Suppose he decides to start with the Emerson System. He tests his present management against the twelve Principles of Efficiency as Mr. Emerson calls them:

1.—Definite Plans and Ideals.
2.—Supernal Common Sense.
3.—Discipline.
4.—Competent Guidance.
5.—The Fair Deal.
6.—Despatching.
7.—Reliable, Immediate and Adequate Records.
8.—Determination of Standards.
9.—Standard Practice Instructions.
10.—Standardized Conditions.
11.—Standardized Operations.
12.—Efficiency Reward.

While this is not a treatise on efficiency, but on cost keeping efficiency, intended to show how to eliminate the waste of time, work, thought, material (all of which spell m-o-n-e-y in business) in the handling of costs, yet it is necessary to explain the philosophy of efficiency if we are to handle costs efficiently.

No manager can escape the necessity for knowing the value of what he does when it comes to costs any more than he can of any other part of his work.

"Increase the net," is the cry.

This manager realizes that all work in a factory, in an office, goes by dependent sequence. No man's work stands alone.

The other day a manufacturer was asked what he thought his efficiency was in different departments. He said that—"He thought his efficiency was 75 per cent. at least," and he forgot the law of dependent sequence. If the raw stock department was 75 per cent. efficient, and the department to which it first went 95 per cent. efficient and the next two were each 75 per cent. efficient at the end of the fourth operation, the end result would be only 40.1 per cent. efficient. If each of the four departments were 80 per cent. efficient, the end result would be 41 per cent. efficient.

If one department were 75 per cent. efficient and another department were 125 per cent. efficient, the end efficiency would only be 93.75 per cent. efficient. The efficient manager, therefore asks of the cost department such records as will assist in the establishment of a complete record of the efficiency and of how much it has cost to gain the amount of efficiency that has been attained.

Establishing Standards of Value

Values must be established as well as costs, and for this purpose we must have every order that goes through a plant, every function of department standardized, establishing the best as a standard of value, by which to judge our efficiency.

Out of that will come the best—

1.—Rate of pay for each man and woman.

2.—Number of people to be employed in doing a particular work.

3.—Kind of men for each kind of work.

4.—Standard time for the operation.

These standards should be indicated on the same records by which the system tells the actual things that were done in the work. In other words, it should show standards as well as performance on each record.

If the comptroller is necessary to show where money goes, then the efficiency manager is necessary to show what is obtained for the money. The cost accountant should be concerned principally with arranging his systems of cost-keeping so that reliable, immediate, and adequate records may be kept of the value of the commodities received for the money invested.

The same record should show:

(a) The comptroller or auditor where the money goes.

(b) The manager where standards of value have been realized, and where losses are occurring in—1. Time; 2. Labor; 3. Material.

In the past the cost accountant has too frequently been merely a man of figures, having little or no conception of what the figures really meant. He was essentially a bookkeeper who didn't know the significance of the things he was handling, and he was only concerned with totals, averages, percentages. So long as he secured his balance, he was satisfied with his results. He knew of no standards for comparing with values.

In failing to realize that accounting really furnished balance sheets which are used as efficiency charts, he failed to set up a practical standard for his own work. Balance sheets can be veritable miles of misinformation. Paper profits have misled many a manager.

A plant can be made to show fine profits on the balance sheets for a time. Efficiency charts would show up the starvation at a glance.

The Cost Accountant and the Manager

Before the cost accountant can become efficient, the management must become efficient. If the management is not efficient, the cost work will not be organized, functionalized, so that it can reflect truly, adequately and completely the real value of the business performance. Therefore, the cost accounting has to reflect what is actually being done. No matter how efficient the cost accountant may be, he cannot make an inefficient plant, or an inefficient organization, efficient. He can reflect only what an organization is doing, showing blanks for those kinds of records which the management handling the business does not permit him to make.

On the other hand, no matter how efficient may be the plan or organization, no matter how efficient may be the individual member of the organization, if the cost accounting records are not efficiency records, there will never be any adequate information placed before the comptroller, or the general manager, that will give them an opportunity to gauge accurately, in the first place, what has been received for the money, and in the second place, where inefficiencies may be eradicated.

The manager under any efficient plan of organization must realize that wastes, principally those which he does not now see, are the most vital concern of management. The "door" type of American manager wants volume of production, volume of sales, volumes of this and volume of that. He does not realize that efficiency is concerned with the net. That is the final as well as the primal test of his efficiency, of his real worth to the organization.

Waste is the Largest "Fixed Charge"

An engineer of national prominence said the other day—"It is absolutely bewildering to note how managers will permit continuous, relatively large wastes to continue rather than incur a pay roll expense that will stop it." Let such men understand that waste is the largest "fixed charge" in most factories."

The efficient manager will therefore develop his cost system along

*Adverising Manager of the Burroughs Adding Machine Co.

the line of obtaining efficiencies as against standards set up by those who are most familiar with what machines and skilled men can produce when all these are at the highest efficiency of production.

He knows a cost system to be a means to an end, and not an end in itself.

He knows that knowing costs is but the beginning of knowledge, and that unless he has some ideal standards with which to compare his costs he is still running the business with but half the information necessary to realize its greatest possible success.

What is the real difference between the rule-of-thumb manager and the systematic manager?

The former guesses at what happened and the latter knows what happened. Neither necessarily knows what the value of the happening really is—the latter knows what it cost, the former can't be sure, but he can "pay his bills"—sometimes.

The difference between the systematic manager and the efficient manager is fundamental. The former occupies his time in writing. manager is fundamental. The former occupies his time in writing history. He is thinking of yesterday; he is always at least one day behind the work; generally he is from a week to a month behind.

The efficient manager is writing prophecies. He is scientifically determining what is going to happen the day after tomorrow. He is systematic, too, but his system is projected into the future. He does not care what happened last week. He is never later than to-day. He was preparing for to-day six months ago.

Step into a great business—get behind the scenes a moment, peer into the laboratories. There are unique furnaces for steel making, there are schools for man training, there are machines that will not be placed on the market for five years—there are careful analyses of markets to be developed two years from now.

The researches are being made—men with note books and open ears and eyes are travelling—engineers are experimenting—all preparing for to-morrow.

When the day comes managers go ahead methodically developing their day-before-yesterday plans, and the game of doing business pays for the prophetic vision. As battles are not fought under the inspiration of the moment, "so the efficient manager never waits for the fighting. He always forces it."

That is the difference between the various types of managers—the difference between their business—the difference between their cost systems. It appears in the net!

Ontario Sells Three Mississaga Timber Berth Rights

The right to cut white and red pine on three timber berths in the Mississaga forest reserve has been sold by the Ontario Department of Lands, Forests and Mines by public tender. The privilege on berths 1B and 1C went to J. J. McFadden, of Renfrew. On lumber cut on the former limit he will pay a bonus of $3.55 a thousand feet, in addition to the dues of $2 a thousand and ground rent of $10 a square mile. On lumber cut on the latter he will pay $4.56 a thousand feet, the dues of $2 and the ground rent of $10 a square mile. Berth 1D was secured by the Hope Lumber Company, of Bay City. It will pay $5.55 a thousand feet in addition to the dues and ground rent. Each berth contains 36 square miles. In each case the highest bid was accepted.

Lower Ottawa Forest Protective Association

The staff of the recently organized Lower Ottawa Forest Protective Association, Limited, to which all the lumbermen and paper manufacturers of the Ottawa and Gatineau districts now belong, will comprise a manager, three inspectors and 50 rangers. In order to co-ordinate the efforts of all the agencies interested in protecting the region from fire, the manager of the association has been appointed an officer of the Forest Protection Branch of Quebec, as well as of the Fire Inspection Department of the Dominion Railway Commission. To reduce the fire hazard as much as possible a close degree of co-operation with the settlers and with the railways operating in this territory is also proposed. The association now represents over 10,000 square miles of timber lands on the watersheds of the Gatineau, Lievre, Rouge, Coulonge and Nation Rivers.

Protection for the Dominion Forests

Adequate protection is to be given the forest areas of northern Canada by the Dominion Government, and with the object of formulating a system, an inspection is now being made of the timber lying all through the interior right to Dawson City. With this purpose in view W. J. Bold and E. S. Davidson left Prince Albert via overland and water routes for the Yukon, and will travel about 3,000 miles. They will secure extensive data concerning not only the timber but the country in general.

E. H. Finlayson, inspector of fire protection for forests of the Dominion Government, is making summer headquarters at Calgary. He will superintend the making of trails and will improve the system of protection in the federal forest reserve on the eastern slope of the Rockies.

Cost Accounting for Woodworkers

Outline of System Which Enables the Manufacturer to Know the Cost of His Product

Third Article of a Series by Jonas Howe

TO know the point at which profit ends and loss begins, a manufacturer must have his expense accounts classified to the accommodation of the cost system. With such an accommodation, each manufacturing department of a concern should put the management in a position to compare the cost of production with the charges made by each department to the sales or shipping department. Unfavorable conditions sometimes make it necessary for a foreman to lay off some of the direct or productive workmen. Under such circumstances the indirect expenses will not decrease in the same proportion as the direct expenses and subsequently the cost of production will become greater. After an examination of the monthly cost report, it may be seen that the cost of production is greater than it should be in some part. Some of the product is changed or certain expenses are transferred which may be better utilized elsewhere. A good cost system throughout a plant is continually the means of reducing or doing away with items of superfluous expense.

Distribution

Expense made up of labor and material are classified as "direct" or "indirect." The direct expenses are consumed directly in the process of manufacturing and are chargeable to the productive jobs. The indirect expenses are not chargeable directly to the productive jobs and are sub-classified in order that a fair charge may be made by adding location rates to the direct hourly rates of employees to cover the operating expenses.

In most of our larger manufacturing enterprises, the cost system is dependent upon fixed percentages which the cost clerks figure on the productive labor to cover the indirect or non-productive expenses. This method of rating would be altogether impracticable in a woodworking plant. Instead of having a fixed percentage to add to the hourly rate of each productive operator, it would be more effective to have the expense rates for the various machines or benches—"locations."

In this system the operator's pay-roll hourly rate, and the hourly rate of his location are added together. If an employee works on a certain job at a certain machine, and his pay-roll rate is 30 cents per hour and his location rate (machine or bench expense) is 16 cents per hour, by adding these together we have 46 cents per hour, which is equivalent to the manufacturing expense in the process of that specified part.

General Upkeep

The General Upkeep, known as the general overhead or general indirect expense, is that part which cannot be charged to a department or a location. Therefore it is not proper to make allowance for this indirect expense in the location rates. The direct labor rates plus the location rates will give the cost of manufacturing, but the general indirect is not controlled by the factory.

When a large part of the business is done apart from the factory through salesmen or shipping clerks in the selling of lumber, in the rough, or imported merchandise, it can be readily understood that this portion of the business is done under the same general indirect expense as the manufacturing product is. Therefore the general indirect may be formed into a percentage based on the general indirect expenses in comparison with the cost of the whole business. The proportion of the General Overhead should however be made the subject of careful and expert analysis.

New Issue of Disston Handbook

A new issue of the Disston handbook on saws has recently been issued. All who are familiar with previous issues of this book understand its unique nature and appreciate the large amount of important information which it contains. Others who have not as yet made the acquaintance of this little book will be fortunate if they secure a copy, because it contains, in very brief form, an exceptionally valuable assortment of illustrated information relating to the construction and use of saws, together with advice in regard to keeping them in order. Henry Disston & Sons, Inc., Philadelphia, Pa., are the publishers of this handbook.

Forestry Convention Arrangements Progressing

Arrangements are progressing favorably for the 16th convention of the Canadian Forestry Association which will be held at Halifax, N.S., from September 1st to 4th. Although the convention will be national in scope, special attention will be given to Nova Scotia and its forestry problems. Forest administrators of the Dominion Government and the timber owning provinces from Ontario eastward, and probably from British Columbia, will be at the convention, and there will also be many lumbermen, forest engineers and others.

Cost Systems and Efficiency

Several years ago a young man walked into the office of a well-known firm whose line of business was the manufacture of mining machinery says L. M. Wilson in the Woodworker, Indianapolis. He asked for the general manager and in a few minutes was ushered into his office. He told the manager that he was very interested in the line of work done there and would like very much to be shown through the plant. After they had gone through all the departments and were again seated in the office the visitor said: "Would you like to increase your output without any additional cost in the way of machinery?" The manager told him that they were always willing to try an experiment to a certain degree. The young man was hired for sixty days, and in that time he reduced the cost of manufacturing over 15 per cent. That man had trained his eye to be so efficient that he could see the small extravagances of the shop, that count up so fast.

A few years ago I was employed to install a cost system in a mill employing about 250 men. One day the superintendent came to me and said: "Peetz, do you think it would pay to employ a man capable of looking after our daily expenditures and losses?" I told him I felt he would never regret doing so. He then secured the services of a young man who came highly recommended. After studying the methods used, for several days, this man asked me how the per cent stood on the manufacture of window frames. I told him it varied from 12 to 14 per cent. He said, "Have you any idea why this should be so large?" I told him I was very busy getting the cost system in order, but I knew that some days it was easier for the men to turn out more work than on other days. "Yes," he said, "but that is not the real trouble. I believe it comes in the arrangement of the machines. Some of them are on the first floor, some on the second, and a few on the third. When the work is finished on the third floor it all has to be carried back to the second to be nailed up. The same situation prevails in the sash department. I believe the machines will have to be rearranged before there is any material difference noticed in the percentage."

This man went to the superintendent and explained how the trouble might be overcome, but the superintendent was afraid to make the changes (that is, at that time), and suggested that they wait awhile. After several vain attempts to get other changes that he knew would be beneficial, the man left in disgust. In about two weeks the superintendent informed his foremen that the work was costing too much; something would have to be done. He wanted each man to explain the workings of his own deparement. After the men had done so, he gave them some suggestions and changes to be made—of course, they were those suggested by the other man. After the changes had been made the cost was reduced about one-third.

The president of this company informed me that the cost of its veneered doors was running too high; the last lot of 100 had cost about 26c per foot. In looking over the cutting bills I found one item of 20,000-lin. ft. of 1 x 2-in. core stock, tongued and grooved. Upon looking up the time, I found twenty-eight hours for sticking, eight hours ripping and twenty-two hours cutting off, making a total of fifty-eight hours for machine work on the core stock alone. The time required to glue up these strips was sixty-two hours, but they were put up by boys ranging from sixteen to eighteen years of age, whose time was figured at 25c per hour. I asked the superintendent why the time was so far out of reason, and he informed me very curtly that the time was alright. "Well, if the time is right, how it is that you have twenty-eight hours' time for sticking the core stock alone, there being just 20,000-lin. ft. on your stock bill? If the sticker which you run this core stock on won't feed 2,000-lin. ft. per hour in softwood, you had better get a new one." "Yes, but you know we have to run the core stock twice." Here was an up-to-date mill man putting 1 x 2-in. strips through a 6-in. sticker twice. I asked him if the bottom head was out of commission. He saw my idea and said: "Peetz, I have so much to contend with that it never entered my mind to run both top and bottom heads."

This concern asked me if I could recommend a first-class man on veneered doors, but, calling to mind the fate of the previous efficient man, I told them I did not know of any one. In about three weeks they secured one from the east, but he was wiser than his predecessor. After spending some two days' time in looking through the plant, he informed the president that he would accept the position providing he was given absolute control, and so, they made a contract for one year. In a short time this man had reduced the manufacturing cost about 16 per cent, most of which was accomplished by stopping small leaks.

If I were the proprietor of a plant and a man came to me for a position, with the recommendation stating that he had been employed by the writer of his letter for twelve or fourteen years, I would be somewhat skeptical about giving him a berth. Take a man that has been in the employ of one firm for years, and he only knows one way of accomplishing a certain piece of work. On the other hand, take a man who has travelled and worked in numerous plants and under different conditions, some good and some bad, and that man has a larger storehouse to draw from than the man who has worked for one firm the best part of his life, and in most cases under only one foreman.

To illustrate: Several years ago, after returning home from one of my trips, I paid a visit to a friend who was the owner of a plant which made a specialty of all kinds of government work, such as field cases, filing cases for enlistment officers, and, in fact, almost anything made of wood and used by the government. He engaged me as machine room foreman, also to install a cost system, saying: "I feel sure there are several places in the mill that are costing me too much." After I had been there for two or three weeks a man applied for a position. I asked him if he had ever had any experience on a shaper, and was informed that he had, so I gave him the berth. We had no glue-jointer in this plant, all such work being done on the double-spindle shaper, using the regular Shimer heads. That man commenced work at noon, and was actually set up, ready for work, at twenty minutes past 4 o'clock—three hours and twenty minutes doing a fifteen-minute job. He told me he had worked for one firm eighteen years, six years on a shaper. I wondered what his work cost that firm, and what success a cost clerk would have with a dozen such men in a wood-working plant.

One of the greatest obstacles I have had to contend with in getting a correct cost is getting the men to send in the correct time, and there are various causes for this. Some men seem to think that it is a piece of foolishness, others become so interested in their work that they neglect turning in their time when they have completed the work, or fail to put it down on their time card, and some spend more time on the time card than on their work. When a foreman meets with these irregularities he must use sound judgment in trying to overcome them.

As an illustration, some time ago we received an order for four yellow pine shelves, 4-ft. by 18 by ⅞-in. We used eight pieces 10-in. wide, and, of course, only had one glue joint, but the time sent in by the different workmen was away out of reason. The stock-cutter had thirty minutes, the jointer man fifty minutes, and the gluing-up man one hour and fifteen minutes. I tried to trace the matter up, but no one knew anything about it. The stock-cutter and gluing-up man were new employees, and I came to the conclusion that they had failed to write down their time, and the jointer man informed me that it was impossible for him to remember two days back.

Another trouble in obtaining a correct cost is the stock we have to contend with. The loss will be greater one time than another, but, of course, is not so great in plants where they manufacture a small line of goods. In planing mill work I figure 25 per cent on yellow pine, 33 1-3 per cent on poplar and cypress, 40 on plain oak and 50 on quartered oak. Of course, it won't run so high on some work, but take it year in and year out, and you will find these losses very nearly correct; and I know of several firms which figure more. As an example, suppose you had a stock bill that required 400-ft. face of 4/4 yellow pine. Have your yard man send you in just the exact amount required on the bill, and you will find, as I have, that 25 per cent is a reasonable loss to add to actual amount required.

Losses can sometimes be reduced by ripping stock first and then cutting it off, and sometimes by cutting it off first, whichever the case may be. As to the loss of 50 per cent on quartered oak (I have reference to planing mill work), suppose that you have a bill with thirty sets of 4½-in. casings, free from all defects and sap clear, what width of stock would you have your yard man send in? Some of you will say 6-in., some 10-in. This is a question which I will answer soon, also give some true figures for adding such a large loss on quartered oak.

Just a few words to superintendents and foremen who are opposed to the cost system: A few years ago the writer received word to come to a city located in central Ohio, and install a cost system. During my ride to this city a new idea came into my mind. It had always been my custom to present my card at the office first, but I decided to ask permission to go through the plant before disclosing my identity. Upon arriving at the office they readily gave me permission to visit the different departments, and, after making my tour of inspection I presented my card at the office. It was my ill luck for my card to fall into the hands of the superintendent, and if the general manager had not been present at the time I am satisfied that there would have been no cost system in that plant, and I would now have one less friend. For two weeks that superintendent used all the means that lay in his power to give me trouble, but about the middle of the third week he came to me and said: "Peetz, I have been wrong in this matter and wish to apologize for my conduct. This cost system has done as much good as installing some new machines that I wanted." There are a great many superintendents who think that a cost system will be to their detriment, when it is as much benefit to them as to the firm.

The Chaleur Bay Pulp & Paper Company, Limited, Sherbrooke, P.Q., has been incorporated with capital stock of $100,000. The incorporator is H. R. Fraser, Sherbrooke, P.Q.

Lumber Prices in Diagram Form

In the June issue of the Labour Gazette, issued by the Department of Labour, Ottawa, the following review of the lumber trade during 1913 is published: "The financial depression of 1913, which was the most pronounced factor in the lumber market, was largely offset by reduction of stocks at the end of 1912. Operations in the woods and mills during 1913 were curtailed, so that stocks did not accumulate and flood the market as a consequence of the lessened demand. Prices held, except in a few grades and localities. At the end of the year the financial situation showed signs of improvement, though it was found necessary to restrict the granting of credit to retailers. On the whole, the dull period came at an opportune time for lumbermen, and no disastrous results to the industry were experienced, the activity of the two years preceding having left the trade in good shape.

"Uncertainty as to tariff changes in the United States during the first nine months of the year caused a considerable falling off in exports, as dealers there bought supplies only in a hand-to-mouth way. The high freight rates to England and the scarcity of ships were also deterrent influences on trade. By October, however, the settlement of the United States tariff question led to a considerable increase in

business. Shipments to Great Britain also increased in the autumn, with more ships and lower freight rates."

The following diagram illustrates the relative prices of lumber during 1912 and 1913. The commodities included are pine, all grades, good sidings, shipping culls, box boards, No. 1 cuts; N. B. spruce and shingles; lath, hemlock, oak, birch, maple, (soft); B. C. fir and shingles. The average of prices during 1890-1899 is considered as 100, and the diagram shows a comparison with this average.

Canadian Railway Ties for India

As a result of the efforts of the British Columbia Government, an order has been received from the Bengal Northwestern Railway of India by the Dominion Creosoting Company, Limited, of South Vancouver, for 160,000 railway ties. The government has been conducting a campaign for extending the trade in lumber and was instrumental in interesting the Indian railway in the timber of British Columbia. Ties used in India have come mostly from Australia, the hardwoods of that country being immune from the ravages of the white ant, which prey upon the native woods of India. Australian ties are becoming dearer in price, which is one reason why attention is being given Pacific Coast fir. The Dominion Creosoting Company will specially treat the timber on order, and before shipment it will be inspected by one of the members of the forest branch of the provincial government. Local lumbermen are sanguine that once the creosoted fir has been tried out in India it will come into favor as suitable material for railway ties in that country.

The Short-Log Saw Mill

The short-log saw mill is an equipment that is growing in usefulness in about the same ratio that we clean up our forestry resources and go back after the leavings. This, however, is not the only source of development in the short-log mill. It is also being developed in connection with the wider tendency to manufacture furniture and other wood work, other special small dimensions, right in the woods. Also, it has been to quite an extent developed along with the making of handle and spoke blanks.

There are different types of the short-log saw mill, and probably some that are really not entitled to be so called, though it is hard to place the line of distinction between the regulation length and a short-log mill. Some people think that a mill that will not cut logs more than 16-ft. long is a short-log mill; others conceive that a short-log mill is one which cuts stock from 2-ft. up to 6 or 8-ft. These two probably characterize the types of short-log mills, and, in a way, give a clew to their different uses.

The true short-log mill has a multitude of uses in making small dimensions of various kinds. Sometimes it is used as a sort of side industry to other work, such as with a veneer mill for cutting up the cores. Again, it may be used for working bolts and cutting heading and short lengths of hardwood of various kinds. Down east they have a type of short-log mill used to cut clapboards or a kind of bevelled siding.

While considerable dimension stock is made on rip and cross-cut saws in the saw mill, there is lots that is made on short-log mills, from timber that might otherwise go to waste; and there is room to save a lot more good timber in the same way. That is, there is room for many a hardwood saw mill plant to install, as a side issue, a short-log mill, then bring in all the short lengths of timber and even take some that shows defects, and cut it up after it is on the yard into any of the variety of products that can be made of short lengths.

Then there is a development in the other type of short-log mills—those handling logs up to 12 or 16-ft. and down to as short as probably 4-ft. In many sections of the country the cream of the timber has been cut out; still there is a lot of what was formerly termed scrub timber, that may be worked to advantage. For this work often the best equipment is a light short-log mill that can be moved about from place to place to save hauling—a sort of portable rig. In a way it should be a successor to the old plantation mill, and right here there is indecision and trouble now and then. There is a natural inclination for a man to want a short-log mill generally, yet want it so that now and then he can cut a few long logs, say up to 20 or 24-ft. Occasionally he can get something of that kind, and he wants to be able to supply the demand for such stock. It is pretty hard to resist the temptation to hook on an extra length of carriage and add extra track, but really the short-log mill should be regarded strictly as such, and should limit its production.

An ideal short-log mill of the second class, or rather of the latter type portrayed here, might be limited to 12-ft. and under in the length of logs. It is better to equip them for cutting the extremes of shortness rather than seek for more length, because it is here we will get economy and utility in cleaning out the scrub stock from our forest resources. So, if you are interested in short-log mills, don't try and make a compromise or mixed mill of it. Study your limitations, and while it may cut you out of some business, you will probably find that you will fare better in the end.—J. C. T. in The Woodworker, Indianapolis.

How to Estimate Net Profit

Here are a few pointers from the National Association of Credit Men on estimating net profit:

1. Charge interest on the net amount of your total investment at the beginning of your business year, exclusive of real estate.
2. Charge rental on all real estate or buildings owned by you and used in your business at a rate equal to that which you would receive if renting or leasing it to others.
3. Charge in addition to what you pay for hired help an amount equal to what your services would be worth to others; also treat in like manner the services of any member of your family employed in the business not on the regular pay roll.
4. Charge depreciation on all goods carried over on which you may have to make a less price because of change in style, damage, or any other cause.
5. Charge depreciation on buildings, tools, fixtures, or anything else suffering from age or wear and tear.
6. Charge amounts donated or subscriptions paid.
7. Charge all fixed expenses, such as taxes, insurance, water, lights, fuel, etc.
8. Charge all incidental expenses, such as drayage, postage, office supplies, livery or expenses of horses and wagons, telegrams and telephones, advertising, canvassing, etc.
9. Charge losses of every character, including goods stolen or sent out and not charged, allowance made customers, bad debts, etc.
10. Charge collection expense.
11. Charge any other expense not enumerated above.
12. When you have ascertained what the sum of all the foregoing items amounts to, prove it by your books, and you will have your total expense for the year; then divide this figure by the total of your sales, and it will show you the per cent. which it has cost you to do business.
13. Take this per cent. and deduct it from the price of any article you have sold, then subtract from the remainder what it cost you (invoice price and freight), and the result will show your net profit or loss on the article.
14. Go over the selling prices of the various articles you handle and see where you stand as to profits, then get busy in putting your selling figures on a profitable basis and talk it over with your competitor as well.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 7-tf

Stumpage Wanted

Wanted to buy white pine stumpage in Algoma District. Address Box 53, Canada Lumberman, Toronto, Ont. 14-14

Wanted

One or two blocks of Spruce, also Pine, must be well manufactured. Apply Box 31, Canada Lumberman, Toronto. 11-t.f.

Wanted

One or more cargoes of 1 and 2 in. Spruce for delivery at a Lake Erie Port,

E. C. BRADLEY LUMBER CO.,
14-17 Cincinnati, Ohio, U.S.A.

Wanted To Buy

Two million No. 1, 2 and 3 Pine Lath and one million Hemlock Lath.

M. BRENNEN & SONS,
12-15 Hamilton, Ont.

Wanted

500,000 feet Hard Maple, 1½-in. to 4-in. Also 1-in. Basswood. Shipment Summer and Fall. Terms Cash. Box 32, Canada Lumberman, Toronto. 11-12

Wanted

1,000,000 ft. Spruce, 1-in., 1¼-in. and 2-in. If not already cut will give sawing instructions. Apply Box 30, Canada Lumberman, Toronto. 11-t.f.

Wanted

Soft Elm, 4/4 log run.
Birch, 5/4 log run.
Quote lowest prices F.O.B. mill for dry or new cut.

E. M. NICHOLSON,
Board of Trade Building,
9-t.f. Montreal, Que.

Wanted To Buy—1000 Birch Logs

fresh, clean, straight and sound, 14-in. and up diameter at small end, 8 ft. to 16 ft. long. Delivery to commence as soon as possible. Terms: 75 per cent. cash when alongside track at railway station, balance when loaded on cars. Write P. O. Box No. 1595, Montreal, stating best price. t.f.

For Sale-Lumber

For Sale

1,600 good Cedar Poles, 25 to 55 ft. long, ready for immediate shipment.

LYNCH & RYAN LUMBER CO.,
14 Marmora, Ont.

Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.

GEO. C. GOODFELLOW,
c Montreal, Que.

We Own and Offer

subject to prior sale, the following Rock Maple lumber:

200,000 ft. 1sts and 2nds 4/4 in., $33 per M.

Wanted-Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents.

WANTED—Position as filer, band or circular. Can furnish best of references. Open after July 1st. Address Box 144, South River, Ont. 13-14

WANTED—Position in Saw or Planing Mill. Office and mill experience. Could take charge of Sales, or act as Mill Foreman or Yard Foreman. Excellent references. Box 44, Canada Lumberman, Toronto 13-16

WANTED—Position as sawyer, circular or band. Can furnish good references; open middle of July. Box 77 South River, Ont. 14-15

Position wanted as practical sawmill foreman. Twenty years' experience. Can furnish the best of references. Address Box 51, Canada Lumberman, Toronto. 14-t.f.

EXPERIENCED SUPERINTENDENT wants position to take charge of lumbering operations, bush, mill, etc. Desires a change. Can get results and furnish the highest credentials. Box 46, Canada Lumberman, Toronto. 13-17

A thoroughly practical lumberman wishes to connect with reliable firm either as salesman or buyer. Ten years as partner in well-known Ontario lumber firm—six years' experience selling on road. Familiar with every angle of lumber business. Would consider salary or commission proposition. Best of references. Full particulars from Box 37, Canada Lumberman, Toronto. 12-15

Situation as FORESTRY ADMINISTRATOR or in the LUMBER TRADE, wanted by two Swedish foresters, both of whom have matriculated, and also passed the higher course examination of the Royal Forestry Institute in Stockholm. Afterwards having positions in the Forestry Administration Department of the Swedish Government; in private Sawmills; and in Forest administration. Both speak English, German and French. One is 40 years old and has been for 5 years manager in a Swedish Sawmill, during which period he has personally attended to the planing, selling and dispatch of timber. The other is 33 years old ,and has during the past 3 years been factor on a Swedish estate, and personally handled every matter attendant upon the administration of a private forest. Correspondence gladly received, together or separately, to "Lumberman 40" or "Lumberman 33" c/o S. Gumaelii Annoncebureau, Stockholm, Sweden. 13-14

Wanted-Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

WANTED—A young man with experience as salesman for sash and door factory. Apply to Box 38, Canada Lumberman, Toronto. 12-15

WANTED—A first class foreman for retail lumber yard, one accustomed to handling men. Good wages. Apply York Lumber Co., Ltd., 1000 Gerrard Street East, Toronto 14

WANTED—Salesman calling on the lumber trade and contractors in the Eastern Provinces, to handle Dr. J. M. Stewart's Veterinary Remedies as side line.

Palmer Medical Company, Ltd.,
10-t.f. Windsor, Ont.

Business Chances

For Sale

Timber Limits, principally Hemlock, also Pine, Spruce and Hardwood. Also Saw-mill, logging and driving outfit. About quarter million burnt timber to be disposed of at a reasonable price. For particulars address Box 52, Canada Lumberman, Toronto. 14-17

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest. If your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf

For Sale

Rare bargain. Band mill located in best lumber and log center on Puget Sound. Rail and cargo shipping facilities. Excellent log pond. Ten and a half acres of land. Price one-fourth of appraised valuation. Must sell quick. Box 765, Canada Lumberman, Toronto, Ont. 8-t.f.

For Sale

Complete sawmill outfit. Machinery practically new. Capacity 20 M. Two boilers 60 and 40 h.p., with cold blast grates, endless log chain, 8-in. steam feed; 3 block carriage with boss dogs; friction canter and sweep; 3 saw edger; 2 saw trimmers and a full complement of saws and belting. Also Long Mfg. Co. lath mill in first class condition will be sold with sawmill or separately. Mill near White Hall, Ont. Apply to Box 41, Jordan Harbor, Ont. 11-14

For Sale

The best timber berth in Alberta, containing approximately one hundred million feet, four-fifths of which is splendid spruce. A railroad will pass within one mile of the limit this summer. The situation makes it an exceedingly easy limit to operate. Price $2.00 per M., easy terms. On account of its close proximity to the prairie markets and easy logging, this is cheaper than B. C. timber for nothing. For further information apply to Box 25, Canada Lumberman, Toronto. 11-14

For Sale
Timber Limits and Saw Mill

Limits No. 59 River Gatineau, 3 square miles, and No. 483 Grand Lake Gatineau, 40 square miles, say 43 square miles, under Quebec Government Licenses. These limits are well wooded and contain Basswood, White and Red Pine, Spruce, Birch, Poplar, Cedar, Pulpwood, etc., also New Waterous 8-ft. Improved Double Cut Band Mill, fully equipped and up to date 200 H.P. Engine, 2 Boilers, Alligator, Boats, Booms, Logging Gear, Waggons, Trucks, etc., Buildings, Camping Outfit, etc., situated at Matts Bay, 31 Mile Lake, P.Q., about 50 miles from Ottawa. This plant has only been in use three years and is in condition to start operations at once.

For further particulars apply to

GUARANTY TRUST COMPANY, LTD.,
802 E. T. Bank Building,
263 St. James Street,
13-16 Montreal, Que.

Miscellaneous

Saw Mill Machinery For Sale

Sawmill near Sellwood, Ontario, daily capacity 60,000 feet. All machinery including:—Log Ladder, Bullwheel, Steam Kicker, Log Loader, Stationary Steam Nigger, 42-in. Steel Carriage, 10-in. Steam Feed, 8 ft. Double Cutting Bandmill, Cast Iron Lumber Table, 5-Saw Slab Slasher, 48-in. Big Champion Edger, Trimmer, Transfers to Edger and Trimmer Tables, Sorting Tables, etc. Also, Independent Lathmill, Filing Room Outfit and Power Plant complete. This machinery is of the latest design, practically new and in excellent condition. Offers will be accepted for all or any part of this machinery, where it stands or F.O.B. cars Sellwood.

The Waterous Engine Works Company,
22-t.f. Brantford, Canada.

Do You Want to Buy or Sell?

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department."

Record Car Shortage Predicted

What is regarded by railroad experts as the forerunner of a sharp falling off in the number of idle cars is indicated in the semi-monthly report of the committee on relations between railroads of the American Railway Association in its statement of car surpluses and shortages as of July 1, 1914, issued July 7. The statement shows that on July 1

the surpluses of cars on 189 railroads throughout the country totalled 220,875. On the date of the previous report, June 15, there was a surplus of 232,994 cars and on June 1 of 242,572 cars, a falling off in the surplus of 22,000 cars in 30 days. It may be safely anticipated that the semi-monthly statements issued for several months to come will show a steadily declining surplus.

It is the opinion of competent railroad authorities that the car shortage this fall will be the worst ever known, despite the fact that there was a surplus on July 1 of 220,875 cars. The last report received as to the condition of cars showed that there were over 200,000 in shops for repairs.

Taking the winter wheat crop on the basis of 655,000,000 bushels, as shown by the agricultural department at Washington, it will require 1,092,000 cars to carry it to market. The spring wheat crop will need 458,000 more cars and the oats crop will require several hundred thousand more cars. The problem of how to do this on the basis of present equipment facilities is one of grave importance to railroad officials everywhere.

New Market for Pacific Coast Lumber

Especial attention should be given to the new lumber market in Spain that is bound to be created immediately upon the opening of the Panama Canal to commercial traffic, says a United States Consular report. The opportunity will be further increased upon the establishment of a regular freight service from the Pacific Coast of the United States to Spanish and Portuguese ports by way of the Isthmus.

The import lumber trade as it now stands in Spain is in a flourishing condition. Oregon and California woods, particularly Oregon pine, are well liked here for their quality and especially for their large size. Several consignments have come to Spain, in reality trans-shipment from France, England and Germany, which puts the local quotations for this lumber at a high figure and renders it practically impossible to compete always with the pitch pine (long-leaf yellow pine) from the Atlantic and Gulf of Mexico ports. Pitch pine is extensively used in Spain and would, it is stated, be still further employed had there not been disputes between sellers and buyers as to quality of lots ordered. This unfortunately has led to a gradual rearrangement of conditions, so that now most importers buy through the large English wood brokers who guarantee fulfillment of contracts and allow a good portion of the payment to stand over until the goods have been received and approved. Moreover they agree to the insertion of a simple arbitration clause in the lumber contracts. At the present time only entire cargoes could profitably be brought direct from United States ports on the Pacific to Spain. This would be too considerable an undertaking regularly for any single importer with the existing high freights and would render a successful competition with pitch pine impossible. When smaller lots can be delivered direct, as is hoped will be possible by the opening of the interoceanic waterway and consequent reduced freights, there will be a certain increasing market for the woods of the Pacific coast.

With regard to American hardwoods and fancy woods, the difficulties of purchase have been thus far so numerous as to induce leading Spanish firms to have their own agencies in the United States, buying at first hand on favorable terms from forest and mill owners and personally supervising the shipment of goods. These importers keep fairly large stocks here, sell at retail, give long credits and at prices which practically give them a preponderating influence in Spanish trade in this line.

Oak staves are handled in the same way as hardwoods and there are two large local firms that have their houses in America and well-nigh control this trade in Spain. The more important firms, whether dealing in lumber, fancy woods or staves are credited with financial responsibility well above anything they might buy. They generally ask, however, for the privilege of paying cash less discount or four months' acceptance, an option they use according to the rate of exchange, which is subject to appreciable fluctuation.

British Columbia Red Cedar

British Columbia is regarded as the last stand of red cedar in North America, says the U. S. Consul-General at Vancouver, in a recent report, and it is predicted by millmen that within the next few years hundreds of new shingle mills will be established in this Province to participate in the profits to be derived from the manufacture of cedar shingles. It is predicted by those who have investigated the subject that British Columbia will have almost the exclusive market of the continent for its red cedar lumber and shingles, and with the opening of the Panama Canal the industry will probably receive great stimulus. Cedar logs and shingle bolts are not exported, except from Crown lands, and this prohibition will result in more mills coming to the Province, as the product must be manufactured here. Washington State has 435 shingle mills with a daily output of 15,000,000 shingles. The capital invested in the Washington mills is estimated at $20,000,000, and they employ 14,000 men with a daily wage approximating $14,000,000 a year. Whatcom County, Wash., has 113 mills, as compared with 60 in British Columbia. More than half of the shingles produced in this Province are exported to the United States, and as there still remains a plentiful supply of cedar timber in British Columbia the industry promises to increase in importance and to become ultimately one of the most profitable in the Province.

Lumber Statistics

The monthly report of the National Lumber Manufacturers' Association showing the cut and shipments of lumber during the month of May, has recently been issued by the secretary of that organization. Taken as a whole, the showing is not very favorable as compared with that of the same month of last year. Both hard and soft woods were shipped in less quantity than the previous year. Out of twenty-seven states from which reports were received, only eight showed a gain in shipments of either hard or soft woods. The net decrease in hardwood shipments for the month was about eight million feet, and in soft woods, about sixty-six million.

The summary shows a decrease in the amount manufactured during the month, as compared with May of last year, of about one hundred million feet. The total decrease in shipments was seventy-four million. The various mills included in the report manufactured 125,500,000 feet more than they shipped during May of last year, and 100,400,000 feet more than they shipped in May of the current year. These latter figures are not unusual, however, for May is an active manufacturing month, and stock always accumulates then.

Circular Saws of Paper

Microscopists well understand the art of cutting thin sections of wood and other materials with rapidly revolving paper discs, acting as circular saws. The centrifugal force developed by the rapid motion holds the paper rigid and it cuts without being equipped with teeth as saws usually are. The use of paper saws are being put to more ambitious purposes in England, according to a trade paper of that country, which recently published an article, saying that a factory is said to exist in England which is manufacturing circular saws from paper. These paper saws are used for the manufacture of fine furniture, veneer, and other thin plates of wood which must be treated especially carefully. Some time ago circular saws made from drawing paper were shown in an England exposition. The saws were driven by an electric motor, and produced fine boards, which could not have been made better even by the finest steel saw. The veneers made in this way are so smooth that the cabinet-makers can use them without further planing.

In a "confidential circular" issued by the United States Department of Commerce under date of July 2, a considerable amount of advice is given catalog houses for their guidance in gaining the trade of consumers in Canada, and the Mississippi Valley Lumberman says that this is evidence that the Postoffice Department of the United States government is not alone in its effort to wipe out the business of the small merchant.

Cleans a building of Rats and Mice in short time, keeps it cleaned, for it is always ready for use. Made of galvanized iron, can't get out of order, lasts for years. Large number can be caught daily. Go to Catcher mornings, remove device inside, which only takes few seconds, take out dead rats and mice, replace device, it is ready for another catch. Small piece cheese is used, doing away with poisons. Catcher is 18 inches high, 10 inches diameter. When rats pass device they die, no marks left on them. Catcher is always clean. One of these Catchers set in a livery stable in Scranton, Pa., caught over 100 rats in a month. One sent prepaid to any place in Canada or United States upon receipt of $3. Catcher, 8 in. high, for mice only, prepaid $1. On account of shipping charges being prepaid, remittance is requested with order.

Review of Current Trade Conditions

Ontario

Ontario wholesalers are reporting some improvement both in city and in country trade. One prominent firm in Toronto state that the month of June was quite a fair one, so far as volume of business was concerned. This firm have also been doing a good business during the present month. Similar reports are made, rather cautiously, by several other firms, all indicating that, possibly, a change in the business situation has commenced. Others, however, who report similar slight improvements do not place much importance upon them, considering that they are simply indications of the spotty nature of the trade, which is sometimes up and sometimes down.

In Toronto, the trade during the early part of the present season was rather dull, but it is now reported that many of the retailers are running short of stocks and are coming into the market with fair orders, so that business is picking up slightly already, and by the first of August may show a fairly average volume. In the eastern part of Toronto an exceptionally active trade is in progress, dealers claiming that they are having much difficulty in keeping up with their orders.

Lath are very scarce. Many customers throughout the province who have allowed their stocks to run down are wiring for delivery. Shingles are commencing to move again, as the yards which were over-stocked earlier in the season have worked off their supplies pretty well. Crop reports from many parts of Ontario give promise of excellent results, which are expected to have a strengthening effect upon the market early in the fall.

The bursting of the dam at Lakes Temiskaming and Kippewa recently caused an extensive rise in the Ottawa River, which was increased by heavy rains, with the result that driving operations on the river were greatly benefitted. Throughout the Ottawa district, trade continues dull, with no noticeable indication of improvement. It is not thought that active trade will revive until fall at the earliest. The export trade is very quiet.

Eastern Canada

A slight improvement in the lumber trade is reported from Montreal, although the volume is still less than it was a year ago. Retailers continue purchasing only for immediate requirements. Prices are likely to continue steady, because of the shorter cut of lumber expected this year. Building returns continue to show a decrease. The export trade is very quiet.

A prominent Albany dealer in Canadian spruce reports that buyers are showing some indication of going into the market more extensively and relieving the pressure from wholesalers which has continued for some time past. Retailers in the Metropolitan district are carrying short stocks of spruce and the stock at Albany is, today, smaller than it has been for many years. It would not take a great increase in the demand to steady the market. Those who are short of stock will now have to depend upon this year's cut, which, it is expected will be short of the average annual production.

Recent reports from St. John, N.B., state that general business conditions are showing signs of improvement. Farmers are encouraged by the good weather and fine crop conditions. House builders are reported to be busy with the erection of a large number of new dwellings and the improvement of old ones. Harbor development enterprises are giving employment to a large number of men. Manufacturing plants are feeling the trade depression a little more keenly than some other lines, but are hopeful of an early recovery.

United States

In the Metropolitan district of New York, trade, while not by any means normal in volume, is sufficient to keep most of the yards going. Competition however, is very keen. Building figures in greater New York for the month of May show a total gain of 21 per cent., which is a little greater than the gain for the previous month. The wholesale market shows a number of slight changes in value. Practically the whole list has been affected, but no large declines are reported. Among the hardwoods, ash, birch, beech and maple are firm, but chestnut, gum, plain oak and poplar are off, on the average about one dollar. Spruce prices in New York are unchanged as a whole, although a few items in short spruce are a little lower. The yellow pine market also shows a reduction of about 50 per cent. At Albany the lumber trade is quite erratic, sometimes showing exceptional activity, and later, exceptional dullness. Business of all kinds appears to be at low-water level. At Buffalo the trade in white pine is unusually slow. Small lots of shingles and lath are in fair demand. Hemlock is quiet, buyers only looking for what they require immediately. The larger buyers in Northern pine are taking only small stocks at present. Eastern spruce is quiet, with prices about as low as dealers can make them. The hardwood trade shows no change of any importance.

At North Tonawanda an improved demand is reported for hemlock. There has been an excellent demand for lath during the past fortnight and stocks at local yards have been wiped out. Northern pine shows no important change. The demand is off for the better grades, especially shop, and prices are uncertain.

Lumber prices in the south, the far west, and the inland empire have advanced during the past fortnight by from 50c to $1 a thouand, and it is generally conceded that the advance is thoroughly justified. This improvement seems to be the result of the better feeling coming out of the excellent prospects for a large and successful crop.

Recent sales of eastern spruce at Boston have been at the lowest base price accepted by wholesalers this year, viz., $23.50 and even $23. In spite of this, there are good indications of improvement, as most retail stocks are low, and orders now coming in are frequently for immediate delivery. Some manufacturers are still getting $24 and a few say they have orders booked ahead at $24.50. There is a fair demand for random, especially 2 x 3 and 2 x 4, which are bringing $21 and $22 to $22.50 respectively. A fair volume of trade is reported in lath at Boston. Sales of 1⅝-in. at $4.15 are not so frequent; $4, $4.05 and $4.10 being more often quoted. Shingles are about steady. White cedar extras have sold lately at $3.45. Some specially high grade brands have been bringing $3.65. The range for clears is from $2.80 to $3.10. Red cedar shingles are rather quiet.

Great Britain

A fair amount of trade is still in progress at London, in spite of a very gloomy outlook in connection with the building trade, involving a possibly general lockout of workmen. Importers have been disposing of their stocks at a fairly satisfactory rate, although very few of them claim to be making any satisfactory profit. At Foy, Morgan & Company's recent auction sale second Quebec spruce 3 x 9 brought £12 and 3 x 7 £9 15s. per St. Petersburg standard. Fourth Quebec spruce 3 x 9 was sold at £10 7s. 6d. and fifth brought £9 5s.

Trade at Liverpool has been very quiet with no noticeable new features to report, so far as soft woods are concerned. The demand is irregular and both agents and importers are finding it difficult to do any important business. It is a long time since there was so noticeable a disposition on the part of consumers to adopt a waiting policy. Everyone reports that orders now being placed are exceedingly small and the turnover is much below normal. Spot prices for spruce are unchanged, but steady. The demand shows no sign of increasing. Only a limited business is going on in the c.i.f. trade.

The trade at Manchester shows no developments of interest, but the volume of trade is fairly well maintained. Small orders are plentiful and total to a considerable amount. Spruce is maintaining its price level in spite of rather heavy arrivals.

The Timber Trades Journal in a recent issue, referring to the spruce and pine markets says:—"In spruce deals from New Brunswick and Nova Scotia there is little doing at present in this district, as shippers are, so far as can be ascertained, playing a waiting game, in the hope that they may do better later on in the season; but they will have to wait until the position shows itself more prominently than it does at present. Much, of course, depends upon the freight market, and should it become necessary for the owners to withdraw their tonnage on account of the labour troubles, there might be a big jump in prices for tonnage for the autumn shipments. This contingency, should it arise, would affect the Quebec pine deal shipments in the same degree. But at the same time it would help off the stocks here, much to the benefit of the importers who have their remainders left over and their present importations left unsold."

A New Herbert Morris Crane Bulletin

Bulletin B7 which has just been issued by the Herbert Morris Crane & Hoist Company, Limited, is devoted exclusively to the Morris Type S1 Hand Operated Overhead Travelling Crane, which is a very light crane, designed in various sizes up to 1½ tons. By making all the main parts of rolled-steel section the weight of the crane itself has been kept very low, thus avoiding that disproportion between the dead weight and the live or useful weight which is so often a discouraging feature of all overhead travelling cranes. An interesting feature of the bulletin, is that it describes a large number of alternative constructions of the lifting gear, which are available for use under the varying conditions found in the many different factories in which this type of crane can be used to advantage. Copies of the bulletin will be furnished on request, directed to the company at their works, Peter Street, Toronto, or their branch office, Coristine Building, Montreal.

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

Ottawa Drives Helped by Rising Water

Ottawa, July 10 (Special to the Canada Lumberman): The heavy rains of the first few days in July, following the bursting of the conservation dam at Lakes Temiskaming and Kippewa caused the water to rise about two feet in the Ottawa river, at the foot of the Rideau canal locks, where measurements are taken. The rainfall for the past month measured 2.12 inches compared with .33 in May and now there is sufficient water in the streams in the Gatineau district to float the logs, consequently helping business at the saw mills.

Business throughout this section of the country continues to be rather dull and the prospect of improvement before next fall is not hopeful. A prominent lumberman speaking to the representative of the Canada Lumberman recently, and discussing the business situation and the money market said: "Money is getting a little easier, but not easy enough to warrant the speculative builder in going into operations on an extensive scale. Lumbermen do not look for conditions to improve very much before the fall, and then only if the harvest is bountiful in both Canada and the United States, which will ease up the money market. There is a noticeable feeling among all classes of business men that trade will revive before very long."

No alterations in price have taken place recently and there are not likely to be for sometime. There is comparatively little moving in the export end which indicates that trade is not very active in Great Britain the largest importer of lumber from this country.

Owing to a big section of the platform in front of the sawmill at J. R. Booth's plant collapsing about 10 days ago the sawmill was put out of business and about 200 men thrown out of employment. The platform, in falling, destroyed two or three small frame buildings near the mill and also did considerable damage to the mill itself. Luckily, nobody was nearby at the time of the accident. It will be three weeks before the mill will be in operation.

Among the candidates elected to the Ontario legislature in the election on June 29th were two lumbermen from this district, namely, Mr. G. C. Hurdman, president of the Hurdman Lumber Company, who won the contest in West Ottawa, and Mr. E. A. Dunlop, president of the Pembroke Lumber Company, who was returned for North Renfrew.

Mr. R. R. Williams, of the Williams Lumber Company, Ottawa, left yesterday on a business trip through Western Ontario.

Montreal Trade Showing a Little Life

Montreal, July 10th (Special to the Canada Lumberman): On the whole, business has slightly improved of late. There are still complaints that orders are below those of this time last season, but there is less gloomy talk than there was. The retailers are purchasing, as a rule, from hand-to-mouth, and are not disposed to buy in large quantities. The prospect is that prices will be maintained in view of the shorter cut which will result from the poor drives. There is little to report in hardwoods.

The sash and door section is by no means satisfactory, although one of the largest firms in the city report that there has been a distinct revival, and that they are fully occupied.

The building returns are not encouraging and are characterised by the same features as previous permits this year—a falling off in large structures and an increase in houses, apartments, and flats. For the month of June the permits totalled $2,278,424, a decline of $334,828, as compared with June, 1913. The figures for the six months show a decrease of $1,420,375.

Exports are still very slow, Watson & Todd being the only shippers who are sending any amount of pine to the other side. A limited quantity of birch is being exported, but trade in the export branch generally has fallen off in a very marked degree.

The business of the late J. H. Redfern, Charlevoix Street, Montreal, has been purchased by the Redfern Lumber Company from the Montreal Trust Copmany, in whose hands the estate was placed for disposal. Under the will of Mr. Redfern the business was to be disposed of within eighteen months. Tenders were invited by the Trust Company, but none was accepted owing to the low prices offered. Since then, however, the estate has been sold to the Redfern Lumber Company, in which local capital is interested. Mr. F. T. Marie is the manager.

The Eagle Lumber Company, Limited, Montreal, are constructing a planing mill at St. Jerome, P.Q. The site is 180 by 123 feet.

The Upper Fraser Lumber Company, Limited, has been formed with a capital of $3,250,000, to take over the assets and liabilities of the Upper Fraser River Lumber Company, Limited, with its head office at the Board of Trade, Montreal. The incorporators include the Hon. W. C. Edwards, Messrs. Alex. MacLaurin, Montreal; C. J. Booth; G. W. Farrell, Montreal; and J. M. Mackie, Montreal. The company is erecting a sawmill at Dome Creek, B.C., which will be driven by electricity and steam.

New York Trade Marking Time

Chase, Talbot & Company, New York, report under date of July 1st, as follows: Our lumber market is stagnant. Such small consumption as there may be is adequately supplied from local yard stocks. Buyers are reluctant to increase their indebtedness through new purchases, while they still find it an effort to provide for their current obligations. Prices are unsatisfactory, and, in the main, quotations of last month are unchanged, excepting in such instances as might be noted of sales at fractional reductions.

Since the beginning of the year the yellow pine operators have predicted an advancing scale of prices, while the fact is the reverse, with to-day's prices the minimum notch.

So few eastern spruce cargoes have arrived that a record would be superfluous. The fact is that the vast consumption of stumpage in New England through the production of wood pulp is so heavy a percentage, that, with normal consumption, New England to-day can produce no more lumber than is required for use within her own borders.

Increased Canadian Shipments to Barbados

Although the general imports into Barbados during 1913 showed a large decrease in value, the imports from Canada increased. White pine, spruce and hemlock were imported to the value of over £40,000 and shingles to the value of over £15,000, the greater part of which came from Canada. All the pitch pine and nearly all the staves and shooks came from the United States, and a falling off took place in the quantity of the latter from Canada. For some years past an effort has been made to substitute other woods for the American oak known as the Portland pack, and in 1911 the quantity coming from Canada was valued at £5,395. The requirements of this trade have been pointed out frequently and the dimensions of the staves given. This resulted in an attempt being made, but evidently the effect is being relaxed as it is believed that staves made of Canadian birch, if properly shaped and made to dimension would replace to some extent the oak stave now in use. The imports of wood from Canada during the past four years have been valued as follows:

Wood	1910.	1911.	1912.	1913.
White Pine and Spruce ...	£31,409	£43,771	£32,122	£38,126
Shingles	12,856	11,685	10,891	14,473
Staves	4,086	5,385	3,334	429
Manufactures, Furniture ...	685	796	766	807
Total value of principal and other articles	151,985	188,281	183,800	192,495

S. P. Musson, Son and Company, Barbados, report under date of June 5th as follows:—

Lumberstuffs—White pine—there have been no arrivals during the fortnight, but stocks on hand are sufficient to last for some time to come. Spruce—No receipts, but we are expecting a cargo, which will supply present requirements. Pitch pine—No arrivals, market amply supplied. Shingles—Arrivals consist of 2,347,000 extra No. 1 cedar laying by the Trn. Schr. "Alvina Theirault" and from St. John, N.B., and 86,000 Long Gaspe by the S. S. "Chaudiere," both lots to our address, and which are now on offer. Shooks—The only arrival is 400 bdls. by the S. S. St. "Ninian," imported on dealers' account. Wood hoops—Receipts consist of 270 bdls. by the S. S. "Savan" imported by a dealer.

Gordon Grant & Company, Ltd., Port-of-Spain, Trinidad, reported under date of June 8th that stocks of white pine and spruce are running low at that port and that both are saleable.

Oak Staves and Spoolwood in England

The Canadian Trade Commissioner at Leeds, Eng., in a recent report dealing with the market for oak staves, says:—A demand exists in this district for oak staves and one local firm import as many as 50,000 at a time. The staves required should be made from quartered white oak and are used in the manufacture of churns, casks and for tightwork generally. At present, supplies reach here from New Orleans and it would be interesting to learn what Canadian makers can offer in this line. The sizes in demand range from 18 inches upwards in length and 4 inches upwards in width. The thicknesses

Exercise

Exercise your muscles for your physical welfare and Exercise your judgment for your business welfare.

You can exercise no better judgment in the selection of your requirements for Dressed Spruce than to use Fenderson's, the "Quality Stock." This stock is the standard by which Dressed Spruce values are judged.

We have never aimed to make the lowest prices—but we always do give the greatest value for every dollar. It's like your clothes. You can buy them for half what you are paying, not as good, of course. It's the same question of value.

Dry stock—prompt shipment—smoothest dressing—best grades.

The Wilson Lumber Company, Portland, Me.

The Wilson Lumber Company (Incorporated), Portland, Me., U.S.A., who have recently joined the advertisers in the Canada Lumberman, are wholesale dealers in an interesting variety of lumber stocks. The office of the company is at 462 Commercial street, Portland, Me., and their yard is located on Hobson's Wharf at the foot of High street. In this yard the company carry several million feet of lumber, composed mostly of cypress and North Carolina pine. They operate their own cypress mill under the name of the Wilson Cypress Company at Palatka, Florida. Throughout the United States, the stock produced at the Palatka mill stands second to none. In North Carolina, the Wilson Lumber Company handle stock from the Atlantic Coast Lumber Corporation, Georgetown, South Carolina. The latter company have one of the largest and most up-to-date North Carolina plants in the south, and the stock which it produces is exceptionally choice. The Wilson Lumber Company represent the Atlantic Coast Lumber Corporation in the State of Maine, and also in Northern New Hampshire and Vermont, and the Canadian provinces. In hard pine, the Wilson Lumber Company have close connection with two or three successful southern firms. They handle a large quantity of rift flooring which comes from a first class mill in Alabama. They can also secure from the same mill rough strips, which they believe are cheaper to ship into the Canadian provinces, because in this way the heavy duty charge is avoided.

With connections of this nature, the Wilson Lumber Company is in an excellent position to supply the Canadian trade with either car shipments direct from the south, straight or mixed cars from their wharf at Portland, full cargoes of North Carolina or full cargoes of cypress and hard pine from their mills at Jacksonville and Palatka, Florida.

The president of the company is Mr. A. E. Wilson and the vice-president is Mr. F. H. Wilson, both of whom are officers of the company in the south and are personally interested in the Portland Company. Mr. R. B. Wilson is treasurer and manager of the Portland end of the business.

April Report of B. C. Forestry Department

The April report of the British Columbia Forestry Department, issued recently by H. R. Macmillan, Chief Forester, is as follows:

Total amount of timber scaled: —		
Saw Logs	44,011,322	F.B.M.
Spars, Poles, etc.	892,139	Lin. Ft.
Mining Props	1,945	Cords
Railway Ties	3,241	Cords
Cordwood	17,343	Cords
Timber Exported:—		
Saw Logs	2,394,290	Ft. B. M.
Spars, Poles, etc.	157,673	Lin. Ft.

Forest Branch Revenue, Fiscal Year 1914 to 1915

Total amount of forest revenue for the month of April was $136,227.14, made up as follows:

Timber License Fees	$ 88,701.00
Timber License Transfer Fees	330.00
Timber License Penalty Fees	1,285.00
Timber Lease Rentals	6,759.59
Timber Royalty	29,151.53
Timber Tax	2,424.10
Timber Bonus	3,226.90
Scaling Fees	2,128.67
Scaling Expenses	200.55
Trespass and Penalties	1,226.14
Timber Sales Rentals	132.08
Scalers Examination Fees	95.00
Handloggers License Fees	175.00
Miscellaneous Revenue	391.58
	$136,227.14

Collections for the Forest and Protection Fund amounted to $9,905.48.

Timber Sales completed during April, 1914, together with location, estimated amount, total value and purchaser:

Range 1 Coast—Douglas Fir, 136,000 at $1.25; Hemlock, 221,000 at 60c.; Cedar, 978,000 at $1.25; White Pine, 16,500 at $1.25; Balsam Fir, 23,000 at 60c.; equals 1,364,500 ft. B.M., $1,559.55; A. P. Allison, Green Point Rapids, B.C.

New Westminster—1,045,000 ft. B.M., at 50c., $522.50; George Black, Vancouver and (Lund).

Cranbrook—200 cords, $20.00; Alex. Kerr, Morrissey, B.C.

New Westminster—1,536,955 ft. B. M. at $1.25, $1,921.20; W. G. Dickinson, Victoria.

Total, 200 cords; 3,956,455 ft. B. M., $4,023.25.

Pipe Sizes for Woodworking Machines

Much progress has been made in the way of installing mechanical systems for removing shavings, dust, gas smoke, etc., in factories says the annual report of the Chief Inspector of Factories for Ontario, but it is apparent that there is still room for improvement, and the following table of sizes may be found advantageous when either improving or installing such systems.

Cut-off Saws:—	No. of Pipes	Size of Pipes
10-16 inch diameter	1	4
18-24 inch diameter	1	5
Rip Saws and Re-saws:—		
10-16 inch diameter	1	4
18-24 inch diameter	1	5
24-60 inch diameter	1	6
Band Saws, small	1	3
Buzz Planer	1	4.7
Pony Planer	1	4.7
Diagonal Planer	1	4.7
Four-sided Planer	4	4.7
Bull Planer	2	4.7
Planer and Matcher	4	4.7
Matcher Heads, each	1	5
Moulder	4	4.7
Sash and Cabinet Shaper	1	4
Door Tenoner	1	5
Sash Tenoner	1	4
Sticker, each head	1	4
Panel Raiser, each head	1	4
Mortiser	1	6
Router	1	4
Jointer	1	4.7
Sand Drum, 24-inch long	1	4
Sand Drum, 30-inch long	1	5
Sand Belt	1	4
Floor Sweeps		6

Sizes of Pipes for Planers, Moulders and Similar Machines With Knives or Saws

Lower Knives		Upper Knives	
Length	5 inches	Length	5 inches
Length	10 inches	Length	10 inches
Length	14 inches	Length	14 inches
Length	24 inches	Length	24 inches
Length	30 inches	Length	30 inches
Size of Pipe	4 inches	Size of Pipe	4 inches
Size of Pipe	5 inches	Size of Pipe	5 inches
Size of Pipe	6 inches	Size of Pipe	5 inches
Size of Pipe	7 inches	Size of Pipe	6 inches
Size of Pipe	7 inches	Size of Pipe	7 inches

For planers handling timber the pipe sizes must be increased 25 per cent. High speed planers and matchers require 50 per cent. more area than indicated in the above table.

Canadian spruce and white pine are now being exported to Cuba in considerable quantities. Cuban importers are looking to the opening of the Panama Canal to figure on lumber from western Canada.

The United States Supreme Court recently made a decision in the Los Angeles Switching case, which is of special interest to lumbermen. It dismissed the appeal of several railway companies against the decision of the Interstate Commerce Commission preventing them from making an extra charge of $2.50 a car for placing them on side tracks serving industries within established switching limits.

A Correction

In the Canada Lumberman of July 1st an interesting article was published in regard to the best class of saws to use for small logs. The article was contributed by the well-known consulting millwright, Mr. I. N. Kendall, of Westboro, Ont. Unfortunately, owing to a typograhical error, a line of the article was omitted in the second paragraph, which destroyed the point made by the writer. Referring to the band resaw, as compared with the gang, the article should have read, "Some would prefer the band resaw to the gang, I would too, were it not for the fact that the gang would make more even sawing, providing that it had proper length of stroke, which, according to my experience should not be less than twenty inches for the above work."

SUPPLIES

With apples scarce as hens' teeth and mostly poor at that you had better try the plan which a great many lumbermen have adopted of using in the camps, California Peaches, Selected Valencia Raisins and Prunes. We have some specials in these lines and here they are:

California Evaporated Peaches in 50 lb. boxes	7½
4 Crown Selected Valencia Raisins	6⅞
Oregon Italian Prunes 80/90 in bags 90 lb.	7½
Oregon Italian Prunes 70/80 in bags 90 lb.	8½

Send us an order.

Grind! Grind! Grind!

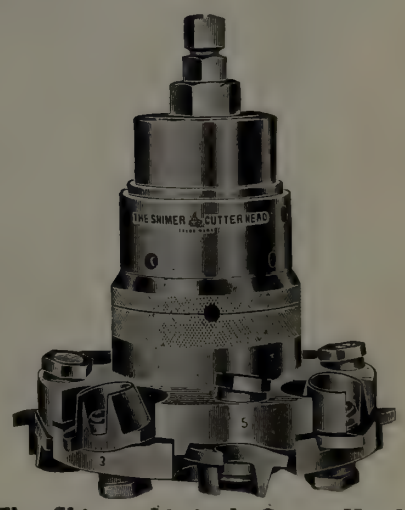
Many a good dollar is wasted at the emery wheel altering cutters to shapes for which they were never intended, often changing them back to the original shape in a few days and ending in wasting more of the steel than is used up in service.

Shimer Cutter Heads stop this waste of time, waste of steel, waste of emery wheels, and enable the mill man to manufacture uniform patterns from year to year. The long-life Circular Bits have the pattern turned into their outer circles in our factory. To sharpen you file or grind them from the inside of the circle, which keeps the original pattern intact as long as their is a piece of the Bit left on the Head. When entirely used up a few dollars will duplicate the Bits and the Heads are again good as new.

The steady demand year after year for the Shimer Cutter Head is substantial proof that they have been making good in the planing mills of this and other countries, and that mill men everywhere are finding it pays better to use Shimer products than to do the grinding on knives of their own manufacture.

A trial convinces the most skeptical. Over 185,000 Cutter Heads have been sold on the trial plan, and we are willing to make tools to cut your patterns and send them on 30 days trial.

Send measurements today!



The Shimer Limited Cutter Heads with Expansion for High Speed Matcher

This High Speed Matcher Head has a chucking device that is self-centering, overcoming the objectionable set screw as a fastening device—reliable and practically perfect in results.

It has a special construction of the bit seats, a bit designed for faster cutting and a greater strength of the holding bolts.

Price, net, for Flooring $72.46 per set, complete.

Fancy Woods and Veneers

THEIR ORIGIN, VALUE AND USE—COMMENT AND VIEWS ON AN IMPORTANT BRANCH OF THE TRADE.

Red Gum—Its History, Stand and Cut

The people of the United States are beginning to take inventories of natural resources. Formerly that was not done, because it was customary to consider that all-bountiful nature would go on forever supplying the necessities if not the luxuries of life to the fortunate inhabitants of this country. People are beginning to learn better. They now understand that a natural resource may be compared to a checking account in a bank; it must be taken care of or it will not last indefinitely. Timber belong in that class, and red gum may be given special consideration because it has reached a prominent place in the country's industries, says Hardwood Record. That position has been attained quite recently. The oaks, pines, yellow poplar, walnut, and many other woods were well known long before the general public had heard of red gum; but when once it had attracted attention its capture of a large market quickly followed. Inquiries are frequently made as to the length of time the gum supply will last. The answer depends upon the available quantity, and the rate of cutting.

The range of red gum begins in the Northeast in Connecticut, and follows a fairly straight line southwesterly to Missouri, and from there the boundary of its range veers sharply toward the south to Trinity River, Texas. This tree is found in all the states south and southeast of that line; that is, in the southern states. The largest stands are in the lower Mississippi Valley. Estimates based on statistics collected by the Bureau of Corporations place the total stand of this wood in the United States at about 50,000,000,000 feet, board measure. In amount it is equal to about one-fourth of all the oaks in the country; two and a half times the hickory; three times the ash; one-fifth more than cypress; nearly three times the maple; many times the elm; and except the oaks, it exceeds in amount any other hardwood, or group of hardwoods in the United States. In fact, it is estimated that one-eighth of all the hardwoods of this country is red gum. It is, therefore, apparent that it is a timber of great importance.

The next question is how much is cut annually; for, if the available quantity is known, the rate of cutting will determine the probable time it will last.

The enormous drain on red gum will not exhaust the supply now available in less than half a century. By that time stands now young will be almost ready to cut, if the growing trees are given a chance.

Red gum is a wood entirely different from black gum and tupelo. These three trees are generally spoken of commercially as being closely linked but there is no justification for such an assumption either from a botanical or a lumberman's standpoint. Neither black gum nor tupelo gum commands anywhere near the important position of red gum. Its nearest relative among the trees of this country is the small and worthless witchhazel. If they were human beings they would be rated as first cousins. Good trees, as well as worthy people, sometimes have very shabby relations.

Native Woods in Furniture

The reviewers of furniture styles and tendencies are now predicting a much more extensive use of native woods in furniture because of the pretty general tendency toward the brown tones, says Hardwood Record. This comes according to these predictions as a part of the high favor now being found for black walnut, Circassian walnut, and gum, which woods in their natural colors run to varying shades of brown. Meantime the brown stains in oak are quite popular and the general tendency is toward colors and tones for which native woods seem better adapted than some of the imported woods.

This is about the best news that could come from the furniture trade to the hardwood lumber industry. Furniture manufacturers of late have been falling far short of what the hardwood fraternity feels they ought to have been doing in the way of native lumber consumption. Part of this is because the furniture trade has been a little slow, but it is evident that part of the drag in the furniture lumber market has been due to an extensive use of imported woods and not enough interest in exploitation of native hardwoods in good furniture.

At the furniture expositions mahogany has been strongly in evidence, and this with other imported woods has made up too high a percentage of the good furniture exhibited for the welfare of the market in native woods. One of the best things, therefore, that could happen to the hardwood industry would be for the furniture manufacturers of the country to turn more interested attention to the use of oak, birch, maple, and gum in furniture manufacture.

If the brown tone era in woodwork is going to help this along we are naturally for the brown tone. This tendency, however, might well include most of our native woods in their natural color and with only enough in the way of staining and treating to equalize or harmonize the tone. Yellow birch has much beauty in its natural color, and this goes well, too, in association with brown tints. Gum has its natural brown, and oak both plain and quartered in natural or near natural finish goes well with it. The main thing, however, is to get the interest revived in native woods. If the furniture manufacturers and dealers prefer the brown stains, the native woods will take them as well as any other, and if it leads to a proper appreciation of our hardwoods in their natural finish so much the better. Native woods have been more or less neglected in fine furniture the past few years and it is high time we had a revival and an era of more favor for native woods. It will be good for the hardwood lumber market and should prove good for furniture manufacturers and users also.

Cause of the Fine Figure in Mahogany

The cause of the splendid figure to be found in mahogany was taken up for consideration recently by a contributor to the "Timber Trades Journal." He points out that the interesting question as to the cause of the various kinds of figure in mahogany is important.

There are several causes: the first is the irregular growing seasons; secondly, the divergence and sinuous course of the new additions of wood caused by the branches intercepting the vascular bundles ; and, thirdly, the cracking of the bark as the tree advances in age. The fact of the bark rupturing allows of irregular, wavy, and spiral growths to form; one grain may be more wavy than another, and one have quicker spirals than another, and after several additions, the spiral is lost and then formed the reverse way. Thus arises the difficulty in planing the wood smoothly.

The older the tree the more figure will be found, and near the base of the tree; the younger the tree and higher up the trunk the less figure will be seen. Specimens would illustrate this better than words.

This cracking of the protective tissue or bark, as it is commonly called, would end the life of the tree, but for the fact that the living cells, which are deeper seated, heal up the breach made, by forming new cells just at the parts most needed; they assume the form of scales peculiar to the tree to which they belong.

While the fissure is open and the wound clean, the new cells and vessels form more numerously there than at any other part, on account of the least resistance being offered to the flow of formative sap, downwards from the leaves, to this opening, so as to prevent water entering, or spores, or insects.

Black walnut is a favorite wood for gun-stocks which require very accurate woodwork. American black walnut is easily worked, moderately light, polishes well, and has a pleasing appearance. Pieces of raw material are rough sawed to shape and the ends of grain are painted to prevent checking. Stock is then shipped to the factory where it is seasoned for two or more years before passing into drykiln. Pieces are next sawn to dimension and prepared for roughturning. Eight operations are required in the factory, including shaping edges for guide surfaces, routing and chambering, cutting recesses for attaching butt swivel-plates, routing out space for magazine and trigger guards, and final hard finishing, polishing, and dipping in linseed oil. Then the stocks are ready for assembling.

In making veneer packages the logs are cut by drag saw into bolts of desired length. A thousand feet, log measure, will cut into six or eight thousand feet of veneer says Wood Craft. Bolts are softened in steam and hot water from 12 to 24 hours, and the bark is removed by hand spuds. The bolt then goes to the stave machine. As the log revolves, knives, slice the face of the bolt to the depth of the veneer. The cores are sawed into thin pieces, several being joined with cleats to make a square board, cut round, and then made into bottoms and lids. Hardwoods and waste stave stock go into hoops.

Death of Overton W. Price

Overton W. Price, forester of International reputation, shot himself through the head and died instantly, at Rugby Grange, Henderson County, recently. Ill health is said to have caused the suicide. Mr. Price's last active work as a forester was at Victoria, B.C., last year, where he was called in an advisory capacity during the organiza-

tion of the forest branch of British Columbia. One of his last public appearances was before the Forest Club of the University of Washington, Seattle, during the month of March. Mr. Price was the right hand man of Gifford Pinchot, in the organization of the United States forest service, resigning from the service shortly after Mr. Pinchot's removal from office. He frequently had been mentioned as the possible successor of Henry S. Graves, whom rumor has it, will shortly relinquish the duties of chief forester. Mr. Price was 39 years of age and was vice-president of the National Conservation Association.

The Care and Arrangement of Stock in the Retail Yard

One of the annoyances as well as risks of damage that the retail lumberman is subjected to is the wind. I don't mean of course the common ordinary circulation of air that is expected in the open and we don't notice, because it is moderate in its force and action says L. H. Ketridge in the Mississippi Valley Lumberman. We call this a breeze and in hot weather is a welcome relief, but, it is when the velocity attains the speed of thirty to fifty miles an hour, that it becomes, not only unpleasant, but dangerous as well in an open lumber yard. It is windy everywhere and in a greater degree at certain seasons of the year, though I used to think when I lived out on the prairies of Nebraska that we had our full share of the moving ozone at all times of the year. But after people had been there a year or two they became accustomed to the stiff breezes, and ceased to regard the every-day wind as the annoyance which it was to them when they first unloaded their car. Understand me, I don't speak of this as a disparagement to my old state of Nebraska, for, as is well known, this pecularity of climate was common to all the prairie states when they were new. I am only referring to it as being one of the climatic conditions that we experienced. Before I left, however, I noticed considerable change in this respect, and though we had winds above the average at times, as they do everywhere, yet there was an absence of the dust storms that we had to endure at an earlier period. I expect though, you fellows out in the prairie country have all had the windy days now that you care for, and therefore you will understand better the allusions I make in this "windy" screed, than would the yard man in the farther eastern states.

In speaking of my own experience I know I will reflect that which was, and is now, common to you all who are running yards in a country town on the prairie where the wind has a sweep over a thousand miles before it gets to you. Like everyone else, I got so that I never noticed the windy weather particularly, until, somebody fresh in from the east would complain of it. But during the summer months there were a good many times when I left the yard at night, I was not sure I would find it in the morning as I had left it the evening before. Many a morning I've gone down and found several thousand feet of stock scattered around the yard and more or less over adjoining lots, entailing a day's hard work to recover it, and put in pile again and this, with the regular business of the day, gave us a double dose of the hardest kind of labor. We had to cuss something to relieve our feelings and so we cussed the country. Besides the work of gathering, and as most of it that took wings was boards it was considerable, because a smashed board is good for nothing, much but kindling and to give away to farmers for seat boards. When you have had several of these experiences during the summer, you develop a hankering for a calmer season.

Dust Storms Damage Stock

But the winds that make life more of a burden to the yard man than any other, are those strong winds that blow for days at a time in the hot, dry weather. They are hard on everybody, but, no other business man in the place experience their detestable meanness as do the lumberman. Every few minutes, there are clouds of dust sweeping through the alleys and whisking in the shed as though the devil himself was using a big broom and throwing it over the sheltered piles for pure cussedness. Every little while a gust will come and with seeming devilish delight toss a lot of boards from piles that you have not had time to tie down. It is dangerous at those times to have a team in the yard, and I've had several runaways from flying boards striking the horses. Very often I've unhitched a team and hitched it outside until the wagon was loaded. With the mercury at one hundred in the shade, one can imagine the feeling this wind and dust gives to the yard man who is facing it all day. At such times, I never wanted to see a stranger come into the yard unless he was a farmer wanting lumber, for his clean appearance would make me think how I must look to him, with streaks of wet dirt on my face caused by the dust and sweat, and no collar, coat or vest on.

There is an old saying, that everyone will eat a "peck of dirt" before he dies, I took all mine in during those days in a Nebraska yard and good big measure at that. I have read a good deal on the importance of having a clean office, and I have written somewhat on those lines myself. But to tell the truth, on those hot, dusty, windy days, I lost the fine edge of my desire to have a clean office, for, in order to have it, I should have had to spend half of my time, in sweeping, washing and wiping. No one but those who have experienced it can realize how the wind drives the dust through and into the ordinary frame building at that time of year in that country. Even though every window and door may be closed it will sift in and cover every thing in sight, and therefore, as I say, I was ashamed to have a stranger call on me during those dusty periods and see the dust covering everything, because, naturally, he would think I was careless about appearances. A yard manager, with only a second man to help him, and sometimes none at all, can only sweep and dust early in the morning, and very often he can't do that, because of the teams waiting to be loaded, or his carpenters hurrying him up for their deliveries. In other words, he is too busy with being up to his neck in work to have a spick and span looking office. There is no time for frills in a country lumber yard on busy days and only one or two men to do all the office and yard work. I am not saying this, you understand as an excuse for having a chronically dirty office as I have known some to be. I like to see, and I like to have a clean attractive office to work in and receive my customers, for such an appearance makes a good impression and helps to draw trade. It is the theories that have been written on the subject, and of the difficulties that yard men have in living up to them, that I am drawing attention to.

A Hard Place to Keep Clean

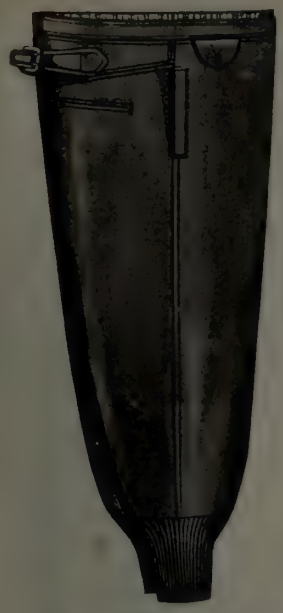
There is probably, no business place in a town that is as dusty in dry weather, as the lumber yard, and at other times, no place so muddy. This is one of the unalterable conditions of the business, practically speaking, because they are not subject to control. The only thing that can be done therefore, is remedy them as much as possible, and even this is not easy to do, because of expense involved in doing it. There are few line yard systems that want to go to the expense of having anything in place of the natural earth alleys in order to lessen the amount of mud and dust in them. The owners don't have to wade in mud nor endure the flying dust while at work. Men can be hired who will do it, because they have to, and the majority of individual yard operators don't want to make the additional investment either, and so put up with the disagreeable inconvenience because of it, and because of having become accustomed to it. 'Tis true, however, there are those among both individual and line yard owners, who have recognized the value and convenience of remedying these conditions spoken of by putting all of their stock under cover, or partly so, in having a large enclosed shed containing the principal part of it. This, of course, does away with the muddy alleys, and shelters the stock besides from both rain and the larger part of the dust. I'll venture to say that any dealer who has had to work in a yard of this kind, will not care to go back to running an open yard again, and those who have worked in both will know the reasons why.

I used to dream of an ideal lumber yard when I had to wear gum boots and swash around in the slush and mud, and go in and out of the office, and look at the great gobs of mud on the office floor brought in by myself and the big over shoes of the farm customers. One may get used to such things, but they never become wholly satisfied with them, and look forward to the time when they will have things more to their liking. The open shed catches a good deal of dust during the summer. The wind seems to take a particular delight in whirling it in there, and there is no way of preventing it when there are dirt alleys, unless there is a water plug in the yard and a hose is used on the surface several times a day. I have often thought that a windmill and a tank would be a good investment to put in a yard where there is no public water system. It would serve a good many useful purposes during the year, besides affording a protection against fire. I did not know how useful city water was about a yard until I had it in my yard here, and I am pretty sure that such a source of water supply as I have mentioned, would be worth all it cost to a country lumber yard.

Stagger Along Without Conveniences

There are too many lumber yards that are trying to get along with the old buildings that were put up years ago, before the business had developed as it has. The little dinky sash room, and the old fashioned molding rack that was built when the yard was first started, have become outgrown, and are unfit for the present needs, and changed conditions in the business. It was the general thought among lumbermen, when they first started their yards, that they would put up such buildings as they could get along with, until they were able to build better. In fact, their lack of capital forced many to economize in this respect, in order to have more to put into stock. It was a case of putting up with what they had to, rather than having what they wanted. But, by the time they had gotten so they could afford to have better buildings, they had become so adjusted to the old and insufficient yard buildings that they were averse to spending any money for a change.

I remember visiting a yard in Missouri where the buildings looked pretty small and shabby, and I hinted as much to the proprietor as he was showing me around, "Well," said he, by way of excuse. "I know they aint anything like what they are over at the new yard, but they



"Van Goods"

Thousands of years ago, the Lumbermen didn't "go strong" on the wearing of clothes; but they do NOW. What they want nowadays are clothes of SERVICE.

SMART-WOODS are ready to fill the want.

SMART-WOODS Heavy Wool Underwear and Woolen Socks are every bit as warm as they are comfortable.

were good enough for me when I first started here, and I think I'll get along with them as they are and the man who has the yard when I get through with it, can make all the changes he pleases."

This is about the same sentiment that controls many of the old dealers I have talked with on the subject. I have found, too, that where a dealer has been a good many years in a place, and has done little or nothing in the matter of improvements about his yard, he is somewhat sensitive to anyone criticising their appearance and lack of convenience. Somehow, they regard it as reflection on them in a personal way, and consider it the same as telling them they are "back numbers" and too stingy to part with some of their bank account. When this class of old yards changes hands the new owners are apt, in the majority of instances, to be content with arranging the stock a little differently perhaps, and making only a few minor repairs and improvements on the old buildings. Practically, it remains the same old yard, with the same old "tucked up" storage room. Perhaps the outside of the buildings is freshened up in appearance with a coat of paint, and the new owner is credited by the local paper as being a progressive man, but that is all the editor or the general public knows about the real facts about the yard.

Due to Changing Conditions

I have referred to the changing conditions in the business as requiring a better class of yard buildings than formerly. Aside from having an improved office, with the modern conveniences and other things for office work there is an equal need for a better class of storage room for doors, windows and other millwork, as well as wagon stock, if it is handled, and the same is needed also, for the proper care and display of such lines as hardware, paint, inside tiling, and all the things that are among the smaller side lines, which a dealer may elect to carry. I have been in several yards where they carried all these articles I have mentioned, and I could not help but note the disorderly way in which they were kept, for they were scattered around in different buildings and in the corners of the shed and covered with dust and rubbish the wind had blown on them. I thought how much better appearance these articles would make if they were all neatly arranged in some clean store room and they should be, even though they are a part of the stock of a lumber yard. It is just as necessary to have them so in a lumber yard, as it is if they were part of the stock in one of the stores on the main business street of the town. If you were to go in a store and see the stock lying around in disorder, as we see it in some lumber yards, you would put it down that that storekeeper was shiftless and didn't know how to run a store. Because things are in a lumber yard, is no reason why they should not be taken care of and kept in good order.

It is hard to realize how deteriorating the effect is of disorder on the human mind that is constantly in sight of it. It lowers the tone and dulls the edge of effort, you may note this especially in homes where things are generally laying around in a chronic state of confusion and disarrangement. The mother and children, being more in touch with it, will show it in many ways. A child brought up in a home of this kind, goes out into the world with a positive handicap, and will meet with many rude shocks before he is disciplined to act in harmony with orderly people.

The Care of Hardwood Flooring

In a great many of the country yards now, the dealers have to keep in stock more or less hardwood flooring and hardwood finish, and a considerable number, sell it without keeping it in stock by getting it in only as it is ordered. Now, a dealer makes a mistake if he thinks he can keep hardwood flooring in good condition in a lumber shed, and it makes little difference also, whether the shed is an open or closed one. I might say here by way of qualifying this, that where a dealer has a constant run of trade in this kind of flooring and can keep his stock moving there is not the same liability of it getting out of condition piled in a shed bin, as there is where the demand for it is only once in a while. However this may be, the average lumber yard is no place for hardwood flooring, unless it can be put in a tight room where it is not so much subjected to the changes of temperature and is kept free from dust as much as possible. Some of you perhaps, don't handle enough of it to appreciate fully the reason for this, I know I didn't until I had learned by experience. When hardwood flooring is shipped, it comes practically direct from the dry kiln, and from that time on till it is put in the floor, it is absorbing more or less of air moisture according to the degree of exposure. Consequently, when it goes into the floor it is expanded beyond its original width when it passed from the dry kiln through the matcher. Therefore, when the heat of the house shrinks it back to the dry kiln width, it leaves cracks in the floor, to the dissatisfaction of the owner who has paid a big price for a first-class floor. This is not a theory I am telling you, but it is knowledge I gained from an experience I'll never forget.

When I came here, I knew but little about oak flooring and I put my stock in one of the shed bins along with the other lumber. Trade was not very brisk at the time in that class of flooring, so it lay there for some time. I sold a few small jobs out of it and got in some more and put it on top of what was left of the old. In course of time, I sold it all out, and the lower part of the pile is what caused the trouble. The contractor layed it in a floor, and when the heat was turned on for the winter, that batch of old flooring wouldn't stay where it was put. In the spring, that contractor had to make it good, and in turn, I had to make it good to him, and it cost me something like $35 to do it. Then I went to work and built a dry room where I put all my hardwood flooring afterward, and by watching closely, I had no further trouble from that source. From this experience, I would advise the dealer who handles this class of stock to keep it out of the shed bins, or anywhere in the shed, where it is subject to damp air, and dust blown on it by the wind. In some large yards, where they handle a good deal of this stock, they have a dry room, that is continually kept so by artificial heat, and they certainly would not go to such expense, unless it paid them to do so.

Better Care of Mill Work

There has been a growing need for some time, for a better class of storage room for mill work especially, and one reason for this is that the inside finish of a house is not so generally painted as it used to be when surface defects could be filled with putty and covered over with paint. The general way of finishing now is to either stain, or finish in the natural color, and for a good job, the surface must be entirely free from dirt stain or other defects. Casing or molding that lies under a shed is exposed to the wind driven dust and the melting of snow on it is sure to stain and render it unfit for a good job of finishing. Instead of the old way of housing this stock, it should be kept in a tight room of dimensions large enough to store it without crowding, and permitting its being easily handled. Taking care of it in this way, has a tendency to impress the customer with its value more than by the old method of letting it lie around as though it had no more value than common lumber.

People take you at your own estimation of yourself, and it is the same with the care and attention you give to your stock. A sash house should be a tight room also, and large enough to permit the handling of stock without jamming it against something. The stock should be dusted off and put in place, and the floor swept out every morning, just as though it was a store in the business centre of the town. A good deal can be done in the arrangement of the stock to make it an attractive place to take customers.

One of the great failings of retail lumbermen, as merchants, is the general disregard they have in the matter of making this stock attractive. 'Tis true, the same faults affects country merchants generally, but when one is found, who has the enterprise to give his attention to making his show windows and store attractive you will find that he succeeds in drawing people inside. Although the lumber dealer may not have the variety of stock to do this, as the storekeeper has, yet by a little study, he can effect a good many combinations with his smaller number of articles. There is no reason why the lumber yard should not be one of the show places in the town. Those of you who have attended a trade exposition, know how much can be done with a few common things to catch the eye and hold the attention. But, in order to do this sort of thing, we must change the size and character of our yard buildings, we must change the lumber yard into a department store of building supplies, and arrange it in accordance with the new spirit and methods of modern merchandising.

Says It Cannot be Done

H. J. Mackin, sales manaager of the Canadian Western Lumber Company, Fraser Mills, B.C., was in Seattle, Wash., recently on a brief business trip. Mr. Mackin questions the statement recently made concerning the amount of British Columbia shingles going into the United States. He says that there are but 300 shingle machines in the province, and with the slower Oriental labor these machines do not average over 26,000 shingles in ten hours. In addition Mr. Mackin calls attention to the fact that with the tariff on, New Brunswick shingles are going into the New England States almost exclusively, and that the British Columbia manufacturer is now pushing the B. C. shingle into Eastern Canada in markets which previously were dominated by the New Brunswick shingle. He also says that the British Columbia manufacturer has lost none of the general Canadian trade previously enjoyed and that it is, therefore, out of the question that as high as 750 cars of shingles a month should enter the United States from British Columbia, with such a limited producing capacity.

Dressed Lumber is on the Free List

The Board of U. S. General Appraisers has reversed the decision of the Customs officials of the port of Ogdensburg in collecting fifteen per cent. duty upon certain kinds of finished lumber, known as novelty siding and beaded lumber, the appraisers holding that these are included in the free list. The effect of this decision is said to put all lumber that is planed, tongued, grooved and beaded on the free list.

EDGINGS

Ontario

The Briggs Planing Mill at Brockville, Ont., was recently destroyed by fire, the loss amounting to $20,000.

R. W. E. Burnaby, 45 Adelaide Street East, Toronto, has had plans prepared for a planing mill at Davisville, Toronto. The building will be one storey, 40 x 100 ft.

The shingle mill belonging to the Estate of Alfred McDonald, at Peterboro, Ont., was recently destroyed by fire, the loss amounting to $3,500, which is partially covered by insurance.

J. E. Baechler, Goderich, Ont., has commenced work upon the construction of a planing mill and a sawmill to cost $12,000 to take the place of those which were recently destroyed by fire.

The sash and door factory which is being erected by R. Truax & Son, at Walkerton, Ont., is nearing completion. The roof having now been put on. The building is one storey, 150 x 90 ft., of brick construction, and the cost is about $7,000.

The J. M. Diver, Sons & Company, Limited, has been incorporated with a capital of $100,000, with head office at Sarnia, Ont., to carry on business as lumber merchants. The provisional directors are J. M. Diver, G. B. Diver and T. S. Diver, all of Sarnia, Ont.

The planing mill belonging to the James Smart Manufacturing Company at the corner of Home and Water Streets, Brockville, Ont., was recently destroyed by fire with a loss of $20,000. The flames also destroyed the boiler house and one dry kiln. The stock of lumber was not injured.

The McEachern Tie & Timber Company, Limited, Thessalon, Ont., which was recently incorporated was organized for the purpose of manufacturing and marketing the products of cut-over pine limits, such as hemlock lumber, logs and ties, cedar ties, poles, posts and shingle stock, spruce and balsam pulpwood, box wood and lath stock. The company are now operating on a 1,200-acre limit in Gould township, where they have installed a small mill with a capacity for cutting 800 railroad ties per day. This timber will come out by way of the Mississaga River. The company also intend to manufacture hardwood ties and other hardwood products when railroad facilities make the timber accessable.

Eastern Canada

Mr. Veinot's lumber yard at Riversdale, N.S., was recently destroyed by fire, the loss amounting to $4,000.

The Upper Fraser Lumber Company, Limited, has been incorporated with head office at Montreal, P.Q., and capital stock of $3,250,000.

The Louison Lumber Company's mill at Jacquet River, N.B., was destroyed by fire on July 8th. The mill was valued at about $25,000. The loss is covered by insurance.

The Bathurst Lumber Company, Limited, Bathurst Village, N.B., has secured incorporation from the Dominion Government, increasing its capital stock from $1,000,000 to $5,000,000.

Lumber to the value of $20,000, belonging to the Kent Lumber Company, at Gold River, Lunenburg County, N.S., was recently destroyed by fire. The company's mill was saved after a hard fight, by firemen from Bridgewater, N.S., which is 20 miles east of Gold River.

R. & T. Ritchie, Aylmer, P.Q., whose large sawmills were reecntly destroyed by fire, involving a loss of about $75,000 have commenced work upon rebuilding. The company carried insurance to the extent of about $50,000. They have purchased a mill from McKay Bros., at Eardley, which will be brought down to Aylmer. A large force of men is already at work preparing for the erection of the new plant.

Western Canada

The Powell Lake Mill Company, Limited, has been incorporated with head office at Vancouver and capital stock of $40,000.

The Barclay Shingle Mills Limited, have been incorporated with head office at Vancouver, B.C., and capital stock of $25,000.

The Whitlock Lumber Company, Limited, of Alsask, Sask., has been registered to carry on business in the province of Alberta.

Limits owned by J. W. Vipond, of Nanaimo, near Wellington, on the east coast of Vancouver Island, will be developed by the Wellington Sawmill Company. The mill will have a capacity of 20,000 feet.

M. Irving, who was formerly in the retail business on the prairies, has taken over the mill of the Acorn Lumber Company, near New Westminster, B.C. He will add a dry kiln and make other improvements.

Plans are being prepared for a shingle mill at Powell River, B.C., for the Wasser-Mouatt Lumber & Shingle Company, of Edmonds, Wash., which recently acquired cedar limits from the C. W. Scraff Timber Company, of Seattle.

The new shingle mill of the Huntting-Merritt Lumber Company, Limited, Eburne, B.C., a few miles south of Vancouver has been completed and the company expected to be operating it about the middle of July. The mill has several new devices for perfecting the quality of shingles manufactured and reducing the cost of operation. One of the most important and unique fea-

tures is that the mill is equipped with a sprinkling system. All the shingles will be made from green lumber, the best of which will be used, as none of the clear or A1 logs will be put into lumber.

The Guilford Island Lumber Company has been registered as an extra-provincial company to carry on business in the province of British Columbia. The head office of the company is at Wilmington, Del., and the provincial head office is at 539 Pender Street West, Vancouver.

Fire totally destroyed the plant of the Fairview Manufacturing Company's sash and door factory on June 18th, with a loss on plant of $11,000 and on stock of $10,000. The insurance was only partial. The principals of the company are P. E. Sutherland and F. P. Baldwin, of Vancouver.

The Empress Shingle mill at Cassidy's Siding, near Nanaimo, B.C., has been sold by Mr. Olsen to Messrs. George and Laurie, who have interests at Owen Sound, Ont., but who are making a start in British Columbia. They propose to engage extensively in the industry on the coast.

The Fairview Manufacturing Company, 2054 6th Avenue, Vancouver, B.C., recently lost their sash and door factory by fire. The damage to the building and machinery amounted to about $11,000 and the damage to the stock amounted to about $10,000. Insurance was carried to the amount of $13,000. The owners are Messrs. P. C. Sutherland and F. P. Baldwin.

J. S. Deschamps, Rossland, B.C., intends to build a mill with a capacity of 40,000 feet per day at Nelson, B.C. Mr. Deschamps also has a similar mill at China Creek, near Rossland. He has just returned from a tour in Alberta and reports that crops are looking excellent, from which he expects that there will be a heavy demand for lumber from the prairies in the near future.

Fire caused $15,000 damage to the mill property of the A. Cotton Company, Vancouver, B.C., on July 2nd. The dry kiln, containing 2,500,000 feet of shingles and a quantity of dry lumber, were wiped out with a loss of $10,000, practically all, however, covered by insurance. The moulding factory was also burned, the loss being $5,000; no insurance. The main mill is still intact.

George D. McKay, provincial timber inspector, and R. E. Benedict, of the forestry branch, Victoria, B.C., have returned from a trip along the route of the Pacific Great Eastern Railway, which is being constructed from Howe Sound to Fort George. They found excellent timber along the line. P. Welch & Company, the railway contractors, are erecting mills at Cheakamus and Summit Lake, and Perkins & Company have built a mill at Pemberton Meadows.

The Great West Lumber Company, Red Deer, Alta., expect to start sawing their logs very shortly. The building and the machinery are being overhauled and put in repair. A new nigger is being installed also an extra 50 h.p. slide valve engine, and a fireproof brick boiler house, with concrete roof. The new engine will drive a band resaw, an extra planer, a small rip saw and a trimmer. It is expected to increase the capacity of the mill by from 10,000 to 20,000 feet of lumber per day.

Trade Enquiries

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names of enquirers by writing to the Department of Trade and Commerce and stating the number of the enquiry.

545. **Lumber.**—A Liverpool firm inquires for samples of white pine and poplar.

546. **Lumber.**—A Liverpool firm inquires for Douglas fir, white pine and spruce.

547. **Lumber.**—A Bootle firm inquires for Douglas fir.

548. **Lumber.**—A Birmingham firm would consider quotations on spruce and hemlock deals, battens and boards.

565. **Lumber.**—A Glasgow merchant desires to correspond with reliable lumbermen in Canada with a view to doing business.

566. **Lumber.**—Some Scotch timber brokers are open to handle British Columbia lumber.

567. **Timber.**—A Glasgow firm is open to purchase ash, hickory and maple in log and sawn to sizes.

568. **Timber.**—Some Glasgow brokers would like to hear from Canadian exporters.

569. **Wood distillation products, chemicals, minerals, etc.**—A London expert who claims a good connection, would be glad to represent Canadian manufacturers of wood distillation products.

576. **Oregon pine, cedar, spruce.**—Old established house in Hamburg, Germany, importing foreign timber is open to represent a first-class British Columbia lumber mill in North Germany. Best financial standing.

578. **Bird's eye maple veneers.**—Prominent firm in Hamburg, Germany, importing foreign cabinet and furniture woods desires to hear from a responsible Canadian mill able to undertake large contracts for absolutely first quality bird's eye maple veneers, rotary cut (1-30-in.) one-thirtieth of an inch thick. Highest financial standing.

581. **Broom handles.**—A London firm prepared to contract for supplies of broom handles (basswood, poplar, spruce and whitewood) in quantity, asks to be placed in correspondence with Canadian manufacturers who can quote for their requirements.

582. **Timber.**—An Exeter firm desires to be put in touch with exporters of Quebec birch timber.

590. **Wood pulp.**—A Scotch agent would like to represent Canadian firms for the sale of wood pulp in Scotland.

605. **Fencing material.**—Inquiry is made by a South African merchant for quotations on Canadian-made fencing material of all kinds.

Disston Cross-Cut Saws

They are ground to a true taper by the special, and exclusively Disston, grinding process. Being ground on lines that conform exactly to the breast of the saw, the blade is absolutely uniform in thickness throughout the entire length of the cutting edge. This special method of grinding gives the maximum amount of clearance without sacrificing elasticity and stiffness. Any man accustomed to a cross-cut saw knows what that means.

And only Disston Crucible Steel is used. This steel combines the hardness and toughness that produces the wonderful edge—and set-holding qualities for which Disston Cross-cut Saws have long been famous.

Send for our Cross-cut Saw Booklet—free for the asking. It is the finest book of the kind ever published.

SPARTAN

NEPTUNE

Are You Protecting Your Profits

or are you indifferent to the fact that they perhaps are being consumed by unnecessary expenses?

Do you consider transmission troubles, power losses, and shut downs for repairs as being natural occurrences in a Saw Mill or Planing Mill? Are you endeavoring to get to the root of these troubles, or are you of the belief that they cannot be helped?

These all too common and unnecessary expenses are largely due to the use of belting which is incapable of meeting the exacting conditions under which it has to work. NEPTUNE and SPARTAN Leather Belting will not only protect your profits but will assist greatly to increase them. These two brands will give the maximum power transmission throughout your plant and will outwear any ordinary belting used under the same conditions.

Neptune and Spartan Belting is backed by sixty-three years' belt building experience and a thorough knowledge of the conditions under which belts have to be used. This knowledge has enabled us to produce in the NEPTUNE and SPARTAN Brands, belting which has proved to be unequalled for the efficient and economical transmission of power.

Why not investigate the Superior qualities of Neptune and Spartan Belting?

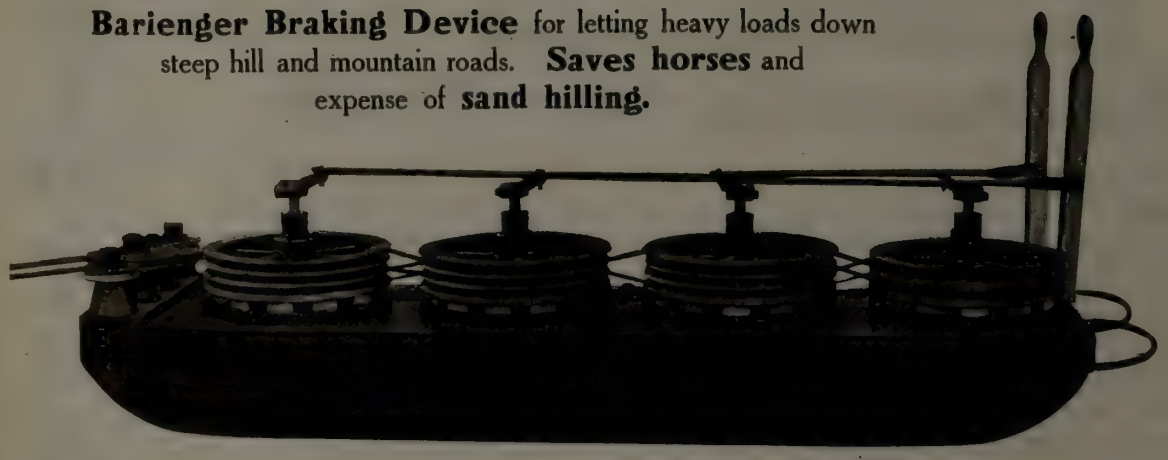
You Need a Brake This Season

Barienger Braking Device for letting heavy loads down steep hill and mountain roads. **Saves horses** and expense of **sand hilling.**



Now is the time to consider the use of this brake for another season before hauling roads are planned and built. By using this brake lumbermen are able to work much steeper roads, and in consequence, shorter roads, and there is a considerable saving in the cost of building roads.

"Wilson Bros." Flooring and Trim

"Wilson Bros." stamped on every piece of this flooring stands for Quality. Look for the name. Hardwood and Pine. **Interior Finish of All Kinds.** Also Hardwood Veneer Doors to detail. We are equipped to fill large or small orders on short notice. Write us for prices.

Wilson Bros., Limited - Collingwood, Ont.

GOODHUE BELTING For

Saw and Planing Mills

In a Goodhue Belt you get only the best leather with the stretch taken out of it. A Goodhue Belt will always run evenly and "clings" to the pulley transmitting 100% of your power.

For the wet places in the mill we have a special waterproof leather belt—"Acme." Other Goodhue Belts are "Extra" and "Standard" recommended according to the conditions under which the belt has to run.

Goodhue Belts stretch less than any other belt by 15 to 25 per cent.

Rutherford's Stock Millwork

KLIMAX

If it's made of wood we can supply it. Our line of stock millwork embraces an immense variety of patterns in doors, newels, mouldings and other trim. Buy from our stock catalogue and you can save money and be sure of prompt shipment.

We are also equipped to cater for special detail work and keep a large plant in operation for this purpose.

The stocks we carry will always be found right up to the minute, and prices will be lower than obtainable elsewhere.

Write us for catalogue.

FOR THE MANUFACTURE OF

BARRELS, KEGS, STAVES AND HEADING

OUR SPECIALTY.

FOR PRICES AND FURTHER PARTICULARS, ADDRESS

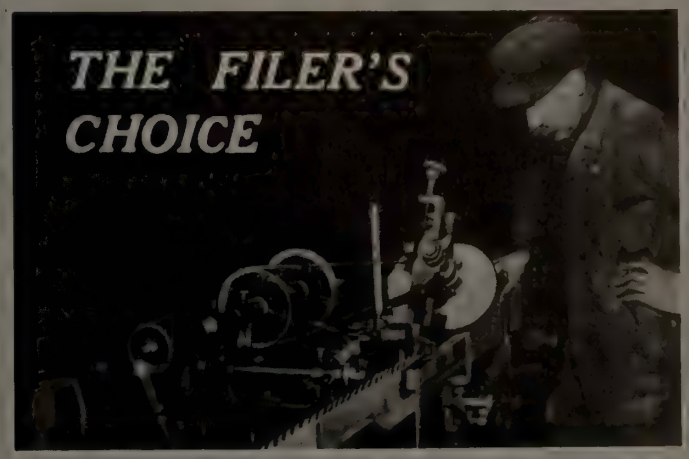
THE PETER GERLACH Co. CLEVELAND O. U.S.A.

Not altogether what we say but what users say

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs, in calm weather, 30,000 in a head wind.

West & Peachey - Simcoe, Ont.



The filer's choice of saw gumming wheels is the wheel that cuts fast, free and cool—the wheel that will hold its shape—show long life—and cut quietly, quickly, easily—without case-hardening the saw or drawing the temper. These are just the qualities he will find in

ALOXITE SAW GUMMING WHEELS

And they are made right—right sizes, shapes, grits, and grades.

Good saw gummers are as necessary in your mill as good saws.

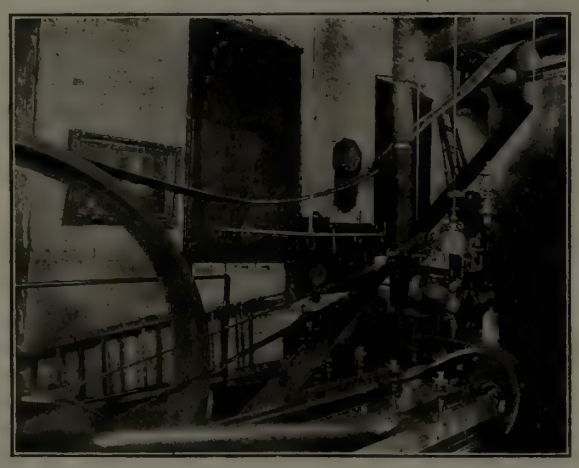
If You Could Make a Safe, Legitimate Investment of $100 Bring You Back $200 in a Year's Time, Would You Do It?

We would and we think You would.



An example:—Mr. Louis J. Landmeir, engineer in the above plant, tells us that scientific treatment of this belt with Cling-Surface costs him only 90 cents per year. Then he goes on to say:

"Belt has had Cling-Surface treatment about 3 years. It is very pliable. No trouble with belt slipping. Never have to take up belt. Used various belt dressings but never had such success as with Cling-Surface."

Can you immagine how 90 cents could have been spent to better advantage?

Don't you think Cling-Surface worth investigating?

Give it a trial and you will be convinced. We quote f.o.b. Toronto.

DIXON'S Traction Belt Dressing

Nothing will so quickly restore a dried-out, stiff, neglected belt, as this semi-liquid composition of every needed "belt food." The proportions are carefully worked out and there are positively no injurious elements in the mixture. And, having restored a belt to first class condition, Dixon's Traction Belt Dressing will keep it up to the top notch of usefulness.

Write today for "The Proper Care of Belts," No. 238.

With each complete size "S" mill we furnish one saw, wrench, cant hook, feed belt, pulley with boxes or tightener and foundation bolts for husk.

Knight

Pony Lath Mill

This mill is built for use with a 10 to 15 horse power engine and as single mill only. It is specially suited to the requirements of thresher and saw mill men operating in small tracts of timber, as both husk and carriage are of a size which will permit of easy loading between the standards of a wagon when moving from one setting to another.

Write for the catalogue of the Knight line of saw mill machinery.

650 Sets Payette's

Famous Patent Mill-Dogs Sold

Why?

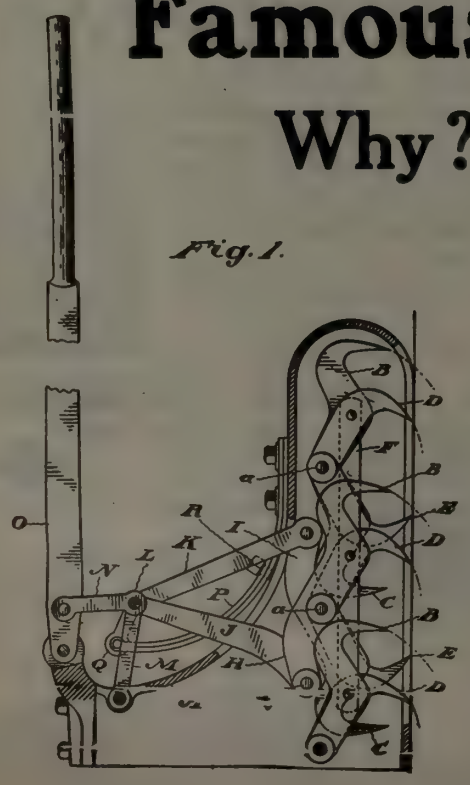

Fig. 1.

Because (1) They will dog with perfect ease and safety in any class of timber.
(2) Will dog just as easily, frozen maple or hardwoods of any description.
(3) Will dog the last board, just as easily as they dogged the first one.
(4) They do not tear the board or stock.
(5) Many other reasons, too numerous to mention here.

Write us for full particulars and booklet on same.

We also manufacture the following High-Grade Saw-Mill Machinery;—New Modern Saw-Mill Carriages, with either three or two head blocks; P. Payette's New Patent Saw-Mill Dog, for use in either winter or summer; P. Payette's Grip-Set Works; Steam Feed Valves, Steam Lifter and Loaders, Valves. Five different class and style of Edgers, for either light or heavy duty. Combined Gang-Circulars and Edgers, or Independent Gang Circulars.
Steam-Canters, Steam Lifters and Loaders, and a general line of saw-mill machinery. Detachable Chain-Sprockets, Castings of Gray-Iron, Semi-Cast Steel, and brass castings for general use.
Descriptive Booklet and prices mailed free upon request.

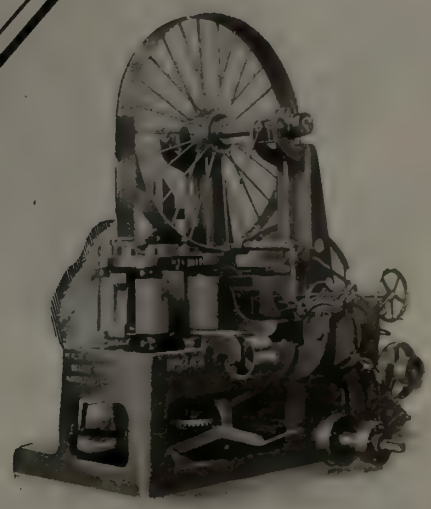
BERLIN RESAWS Assure More Profits—Every Hour of the Day, Every Day of the Week, Every Week of the Year.



Berlin Resaws Produce Economically

These resaws are especially adapted to Canadian Planing Mill and factory conditions. No. 341 has 54-inch wheels and tilting feed works. No. 342 is a 64-inch, short saw machine with large capacity and powerful feed works.

There's a Berlin resaw especially designed for your work. There are single verticals for light, medium or heavy duty and a twin vertical for long shook stock; the single horizontal and the twin horizontal for resawing short shook stock, besides the slab resaws. All Berlin band rip and resaws and band mills are simple in design and operation and easily kept in order. Whatever ripping or resawing you want to do can be done at lowest possible cost on a Berlin.

Easy to Operate

On Berlin resaws the conveniently placed operating devices make maximum results easy to obtain. That's why any average workman can successfully operate them and also why reduced cost is assured.

The wheel tilt and quick cross-line adjustments are especially conveniently placed. The top saw guide adjusts from the front of the machine; a throw of a lever changes the speed of feed. The rolls are positioned by a quick, accurate set works.

Easy to File For

Filers say that blades on Berlin resaws endure longer runs at fast feeds—that our very sensitive Knife-edge straining device is assurance against cracked blades. The saving made because of low upkeep cost of blades and machine is one reason for installing Berlin resaws. Before you decide on any particular resaw, investigate thoroughly the merit of Berlin "Quality" built band sawing machinery. Berlin resaws are working in many Canadian mills. See one in operation.

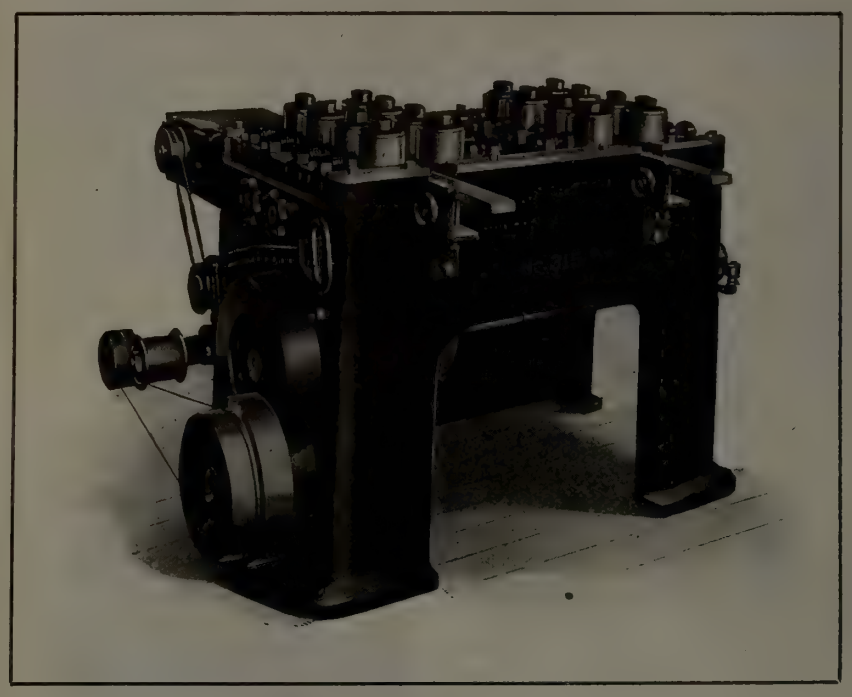
We'll send you complete data and the address of your neighbor user if you'll drop us a card request.

BERLIN MACHINE WORKS, LIMITED, Hamilton, Ont.

Largest Manufacturers of Woodworking Machinery in the World

UNITED STATES PLANTS, - - - - BELOIT, WISONSIN

Improved Box Board Matcher



16 driven feed rolls, 4⅛ in. in diameter, each one of which can be adjusted independent of all others.

4½ in. between centres of first and second pair; 5½ in. between centres of second and third pair (the cutters work between this pair) and 4¼ in. between centres of third and fourth pair.

This Matcher is compactly and rigidly constructed with every part readily accessible and the operators are close together when working.

Catalogue gladly furnished which illustrates and describes many other machines built expressly for Box Factories.

Mereen-Johnson Machine Company, MINNEAPOLIS, MINN. U. S. A.

LOW MAINTENANCE COST LOCOMOTIVES

The life of a locomotive depends upon the care taken in manufacturing. Care in manufacturing increases profits by decreasing cost of maintenance and repairs.

From their long experience in locomotive building, our engineers have learned what is necessary to increase the life and usefulness of this class of equipment. They are qualified to co-operate with you in selecting the locomotive best suited for your work. Let them help you.

Taylor and Arnold Ltd., Sales Agent, Montreal and Winnipeg

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Department of the Interior, Ottawa, Deputy Minister.
December 20th, 1912.

A Lumber Piling and Unpiling Machine

A Hilke 30 ft. PILER working in the yard of the Shevlin-Clarke Co., Limited, Fort Francis, Ontario.

This machine will pay for itself from one to six times per annum, all depending on the scope of its opportunities.

It reduces by half your cost of piling and unpiling lumber.

It saves half your cost of alley floors or roads.

It reduces by half your number of pile bases.

It cuts squarely in two your costs of roofing lumber.

It saves just half your yard space and this always means much even where land is very cheap, because it costs money and lots of it to haul lumber round a yard.

It takes lumber down from high or low piles with perfect freedom from breakage or injury.

It sets the pace for your men and helps them do much work with little labor.

It is as mobile as the men who operate it and when placed in front of a pile is instantly ready for work.

It removes at once and forever the need of using elevated tramways with their great first cost, impaired circulation and imperfect drying below their surface.

It is a maker for efficiency because it is itself so efficient that it naturally turns your mind toward other yard economies of which there are usually many never before observed.

Patented in the United States and Canada by H. C. Hilke.

Keep Your Filer Satisfied—

The work your Filer does is limited to a great extent by the equipment he uses.

Give him the kind that allows him to keep your saws in the best possible condition—and his work will be reflected in the out-put of your mill.

Smooth cutting, easy running saws mean smooth sawn lumber—the secret of both is

"COVEL" SAW FILING EQUIPMENT

We can supply COVEL Filing Room tools capable of handling circular saws up to 84″ diameter, and band saws up to 20″ wide.

Both in Canadian and American installations, where severe service is the general rule, COVEL Filing Room Equipment is the first choice of the filer who *knows*.

We specialize in the equipment of Filing Rooms complete—any size, small or large. Write for our catalogue.

McKinnon Chain Co., St. Catharines, Ont.

Reduce Your Fire Risk by Using Fairbanks-Morse Internal Starter Motors.

No complicated starting apparatus is required as they are controlled by simply closing or opening a line switch. The varying resistance necessary for starting is secured by varying the pressure on a number of carbon discs which form one of the three resistance units. There being no moving contacts there is no chance of sparking and fire risk is practically eliminated as far as your motor is concerned.

The gradually increasing pressure exerted by centrifugal force on the carbon discs gives a very smoothly starting motor.

A simple screw adjustment of the resistance units allows the starting torque to be changed from normal to 200 per cent. full-load running torque if required with a starting current of about one-half that required by the ordinary squirrel cage motor.

Send for Bulletin No. 210.

A Drag Saw That Does Not Drag But Saws All The Time

This is an iron frame machine, with attached counter and belt shifting apparatus. It is equipped with a saw blade 5′ 6″ long by 10″ wide with teeth filed to cut both ways, and with a 26″ stroke. The saw can be raised or lowered by a hand lever while the machine is in motion and when raised it can be locked in position while the log is fed forward for the next cut. It will cut logs from the smallest sizes up to 48″ in diameter and is especially useful in dimension mills for preparing stock for hubs, spokes, handles, rims, shafts, poles, neck yokes, hoops, staves and various other woodwork. Write for descriptive circular and price to

650 Sets Payette's

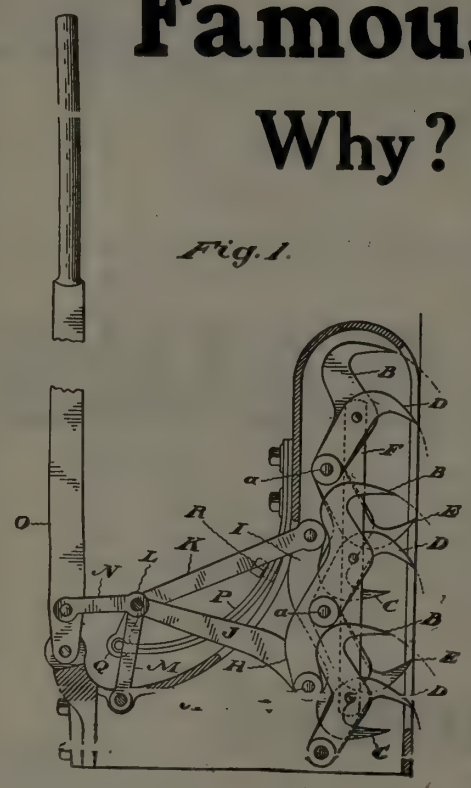
Famous Patent Mill-Dogs Sold

Why?

Because (1) They will dog with perfect ease and safety in any class of timber.
(2) Will dog just as easily, frozen maple or hardwoods of any description.
(3) Will dog the last board, just as easily as they dogged the first one.
(4) They do not tear the board or stock.
(5) Many other reasons, too numerous to mention here.

Write us for full particulars and booklet on same.

Fig. 1.



We also manufacture the following High-Grade Saw-Mill Machinery:—New Modern Saw-Mill Carriages, with either three or two head blocks; P. Payette's New Patent Saw-Mill Dog, for use in either winter or summer; P. Payette's Grip-Set Works; Steam Feed Valves, Steam Lifter and Loaders, Valves. Five different class and style of Edgers, for either light or heavy duty. Combined Gang-Circulars and Edgers, or Independent Gang Circulars.
Steam-Canters, Steam Lifters and Loaders, and a general line of saw-mill machinery. Detachable Chain-Sprockets, Castings of Gray-Iron, Semi-Cast Steel, and brass castings for general use.
Descriptive Booklet and prices mailed free upon request.

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale:

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.

1 Double cylinder steam nigger, right hand.

1 Log Loader for right hand mill.

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.

1 left-hand steam nigger.

1 Log-loader.

1 Endless chain jack ladder with two kickers complete for right and left hand mills.

2 Roger Gang Edgers for 8-in. cants and lumber.

1 Waterous double edger, 6 saws.

2 2-saw trimmers.

1 20-ft. Slash table.

1 16-ft. Revolving Slash Table.

1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works.

1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.

1 Lath Mill with bolter.

2 Lath Trimming Saws.

FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.

1 Automatic Grinding Machine for 8-in. S.C. band saws.

1 Automatic Machine for circular saws.

1 Hand Machine for cut-off saws.

1 Lap Grinder.

1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws.

POWER PLANT

2 Double Duplex, high pressure Water Pumps.

5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.

2 125 h.p. Water Wheels.

1 Upright Engine for sawdust conveyor.

1 10 h.p. Engine.

1 Mitts & Merrell Hog.

1 Wood Machine for 22-in. wood.

1 Wood Machine for 16-in. wood.

1 Edger for ripping dry lumber, installed.

1 Edger for ripping dry lumber, not installed.

1 30 h.p. Generator, 250 volt.

1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

The

Parry Sound Lumber Co.

Limited

26 Ernest Avenue, TORONTO, CANADA

THE

SIMONDS

Inserted Point Saw

Works Well Winter or Summer

Cuts all kinds of logs. Saws smooth, easy, and fast. Saves time, lumber and labour. This saw is not less expensive in the first place than other brands, but there is less trouble or expense in its up-keep and you will find that the experienced Sawyer makes this the particular point to consider when putting in a new saw.

Let Us Tell You More About the Saw, Quote Prices and send Catalog. Our Factory is in Montreal.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3.00.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 34 Toronto, August 1, 1914 No. 15

A Good Market for Canadian White Pine

As the following import figures indicate, Trinidad offers a fair market for a considerable quantity of lumber. The qualities imported are almost altogether yellow pine (pitch pine, as it is known locally) which comes from the United States, and white pine from British North America, says a Trade and Commerce report.

Year	Total		British North America		United States of America	
	Feet.	Value.	Feet.	Value.	Feet.	Value.
1909	7,092,357	£48,451	911,545	£4,119	6,032,981	£37,718
1910	11,634,767	77,903	968,352	5,753	10,561,366	71,365
1911	10,669,806	75,949	820,327	6,204	9,772,466	69,162
1912	11,213,744	84,613	1,708,812	12,892	9,379,917	70,765
1913	6,970,690	53,338	1,345,773	8,775	5,519,724	43,697

It should be noted that of the quantity received from Canada in 1913, 883,518 feet, valued at £5,115 was entered at the preferential rate which came into operation on July 1. The duties are: For undressed lumber $1.60 the 1,000 feet preferential, $2 general; dressed lumber, $2.40 preferential, $3 general.

The quality of imports both from Canada and the States during recent years has been inferior to that received formerly, whilst prices have advanced. This is more particularly noticeable in the hard, or yellow pine, and it is often the case that the soft, or white pine, is now substituted where at one time the former was alone used. There is always a good demand for good lumber, but it is seldom procurable now. Really good, sound, hard pine is much wanted. An excellent, fairly hard wood, known as yellow St. Lawrence, is sold in the Scotch market, but none of it reaches Trinidad. Perhaps the prices make it prohibitive. There is also the Douglas fir, which might to a certain extent replace pitch pine.

It is in this connection that the opening of the Panama Canal may have a certain bearing on the trade, apart from the regular demand existing for white pine. Already firms who look ahead have been addressing lumber merchants in Trinidad both from British Columbia and from California as to the prospects of trade via Panama. Importers look with much interest on the expected developments, and will welcome new sources of supply. Much, of course, will depend on freight. Present rates are, for white pine from Halifax per sailer, $6 per thousand feet; from New York by steamer, $6.50. The late steam contractors for the Canadian service objected to carrying lumber. It may be presumed that if the lumber trade with British Columbia is to be effected, sailing vessels will not be suitable, as, apart from canal dues the British West Indies Islands are dead to windward of Colon, and current and trade wind combined would operate against the voyage being completed within any reasonable time.

Large steamers would probably be employed in the trade, capable of carrying far more than would be required here in one shipment. Fortunately the geographical situation of Trinidad to a great extent obviates this difficulty. Trinidad is directly in the trade route which will open with the Panama Canal between the Pacific side of North America and the River Plate and the Argentine on the Atlantic side of South America; it is both a coaling and an oil station, and in the regular course of things seems bound to become a port of call for steamers going south from the west of North America, and returning, as it is at present for all the leading lines running between New York and South America ports. The necessity, therefore, of ordering or taking full loads would not exist.

Lumbermen in British Columbia would do well to make known the different kinds they have available for export, whether as scantling or boards, and samples should be sent, with statement of prime cost, so that estimates could be made of comparative price.

Lumber is at present commanding high prices, perhaps due to the fact that there are only four large regular importers. The retail prices of pitch pine are from $42 to $53, according to size. White pine and "Baltimore boards," 8 inches wide, $45; "New York" white pine, 10 inches wide, $48; 12 inches wide, $50; Nova Scotia boards, $32 to $38, according to width.

British Columbia's Lumber Trade Problem

The industrial and financial situation in connection with lumbering in British Columbia is outlined clearly and forcibly in a brief memorandum prepared by the Forest Branch of the Department of Lands for presentation before the Dominion's Royal Commission, which is about to make a tour of Canada with a view to reporting upon industrial and trade conditions throughout the country. By reference to the memorandum, which is published elsewhere in this issue, those who are interested in British Columbia may learn just what the trouble has been with the lumber industry during the last few years. The whole situation is explained in a manner which shows that the chief trouble has been too great a producing capacity in the mills, compared with the amount of trade at present available. The remedy is also very clearly shown to be a vigorous campaign with a view to increasing the number and widening the scope of the markets for timber and lumber produced in that province. The present annual cutting capacity of British Columbia mills is 3,000,000,000 feet. During the year 1913 the sales from British Columbia mills amounted to 1,250,000,000 feet; or in other words equipment was available for producing double the amount which was sold. The expense of maintaining all this unproductive equipment is probably the heaviest burden the industry has to bear, and unless much of this equipment is to be wasted, means must be found for increasing the amount of profitable sales.

Even if the sales are increased in the near future so as to equal the present producing capacity, it is certain that, before such a result is brought about, the capacity will have been increased, not in equal proportions it is to be hoped, but by a very considerable amount, because the growth of timber in the province is sufficient to sustain a much larger production than that which the present mills can handle. The provincial forests would, in fact, support in perpetuity a cut four to five times as great as the present annual cut, or between 6,000,000,000 and 7,000,000,0000 feet per year. This information has been secured by the trained foresters of the Department of Lands and we believe that it can be depended upon thoroughly; in fact, some people

believe that the estimate is a conservative one. The Department of Lands desires, naturally enough, to make the forests produce the greatest possible revenue consistent with the perpetual preservation of timber cutting at its highest possible amount.

If only 1,250,000,000 feet are being produced annually and it is possible to produce 6,000,000,000 or 7,000,000,000 feet, the situation is not satisfactory, and calls for attention on the part of everyone connected with the industry. Government and individual efforts must be directed, first of all, to an extension of markets, which alone can enable the industry to expand. These markets must not only be searched out, but they must be studied, and means must be adopted to see that those who could consume the products of British Columbia forests are made acquainted with them as completely as possible.

Transportation problems are of equal importance. There are many large markets today which would annually consume much of the products of the British Columbia forests, if they were made available. Much trade is being lost in eastern Canada today because those who desire British Columbia products cannot secure them. Possibly the Panama Canal will make an important difference in connection with transportation. Many who have studied this feature of the situation believe that the opening of the canal will make it possible for the industry in British Columbia to enter upon a new era in which its markets will be widened as a matter of course. Transportation, in fact, is the key to the whole situation today, and upon it depends, for many years at least, the future prosperity of the British Columbia mills.

The memorandum referred to above includes also an interesting outline of the forest products of British Columbia and an account of the extent of the industry and of the present available markets. In summing up the trade situation, it states that the causes of lack of trade are:—

(1) Lack of information about British Columbia timbers;
(2) High freight rates and other transportation difficulties;
(3) The fact that most of the British Colubmia mills are not built and located so as to handle a large cargo trade, being built chiefly with a view to handling railroad trade.

Report Upon United States Timber Ownership

The United States Commissioner of Corporations sent to the President another letter of submittal in connection with reports of the investigations of the lumber industry. The actual reports, parts, 1, 2, and 3 which are now covered by letters of submittal have not yet been made available, but are expected in the near future. Referring to the ownership of standing timber, the latest letter of submittal states that it covers the period from 1907 to 1910 and treats of the concentration of timber ownership in selected portions of the timber area. The concentration is illustrated by elaborate ownership maps of large regions in Washington, Oregon, California, Idaho and Louisiana, covering 65,000 square miles.

"The mapped areas contain 755,000,000,000 feet of timber, or one-third of all the privately owned timber in continental United States, exclusive of Alaska.

"Ownership in the important timbered regions covered by the maps is highly concentrated. Thus, in the south-western Washington map area two holders have 49 per cent of the timber; in the western Oregon area, five have 36 per cent; in the northeastern California area, six have 70 per cent; in the redwood area, ten have over half; and in the north central Idaho area, four have 59 per cent.

"The control of standing timber in a comparatively few enormous holdings, speculatively held far in advance of any use thereof, and the great increase in the value of timber, resulting in part from such speculative holding, are underlying facts that will become more and more important elements in determining the price of lumber as the supply of timber diminishes.

"Incidental to its study of the concentration of timber ownership, the Bureau has found a corresponding concentration of land ownership. The main fact shown is that 1,694 timber owners hold in fee over one-twentieth of the land area of the entire United States from the Canadian to the Mexican border. In many States these 1,694 own no lands at all. In the 900 timbered counties investigated they own one-seventh of the area.

"These 1,694 holders own 105,600,000 acres. Sixteen holders own 47,800,000 acres. Three land-grant railroads own enough to give 15 acres to every male of voting age in the nine western States where almost all their holdings lie.

"Not all this land is suitable for agriculture. In the South and in the Lake States and in part of the West a large portion of it can be used for agriculture after the timber is removed; but in many parts of the West the land is mountainous and adapted chiefly to reforestation. Much of the railroad-owned land outside the timber regions is arid or semi-arid.

"In the Upper Peninsula of Michigan 45 per cent. of the land is held, mostly in fee, by thirty-two timber owners. In Florida fifty-two holders (nostly timber owners) hold one-third of the land in the entire State.

"This marked concentration in the ownership of land has two important aspects. The first is the concentration of control of the natural resources, other than agricultural, in the area comprised in these great holdings. Besides its timber now standing, part of the land must be depended on, together with the national forests, to supply future crops of timber. Furthermore, some of it has valuable resources of ores, oil gas, water power, etc.

"The second is the possibility that these holdings, which will form a considerable proportion of the future area used for agriculture in this country, must be retained under concentrated control. Fornerly lumbermen often got rid of their cut-over land at nominal prices or let it go for taxes. But as the agricultural possibilities of such land have become apparent this policy is being abandoned. A large part of the present cut-over land is now of considerable value for tillage. That part of the present timberland which when denuded will be arable will have a higher and higher value as land the longer the timber is kept uncut."

Sunday Labor in Pulp Mills

Abbe Casgrain, Chaplain of the Immigration Department in Quebec, in a recent interview expressed himself strongly in regard to Sunday labor in the Province of Quebec, and referred in particular to the pulp mills. "It is a regrettable fact," he said, "that in practically every pulp mill in the Province of Quebec considerable work is done on Sunday. In some places the mills cease running for a few hours, but even during the interval many men are employed to clean the machinery and carry out repairs or work of a special nature.

"It is well to note that Sunday work is always highly paid, and that this creates a tendency on the part of the men to leave over for Sunday repairs or the special work, which could well have been carried out during the week.

"In other places the mill cease work at 7 a.m. on Sunday and start again at 7 a.m. on Monday—and this arrangement, suits very well those who do not observe the Sunday; for it gives them ample time to sleep a great part of the day and enjoy themselves during the remainder of it, and after a good night's rest to return on Monday morning.

"The question naturally arises, why should not work be suspended from midnight on Saturday to midnight on Sunday, instead of from 7 a.m. Sunday to 7 a.m. Monday, and in reply it is alleged by the companies concerned that they cannot get their men to resume work at midnight on Sunday and that, therefore, work has to be suspended till Monday morning. Now, even if this were true, it would certainly not be a sufficient reason for disregarding the law of God—but is it really true?"

"We can scarcely believe it, for we have striking evidence to the contrary, in the case of the Chicoutimi Pulp Company, which operates

three large mills and which we are credibly informed, has not experienced any difficulty in getting its workmen to resume work at midnight on Sunday."

"It is also a remarkable fact that no work of any kind, not even repairs is done on Sundays in the Chicoutimi mills. These repairs are carried out during the week, and the output of the mills has not suffered thereby. On the contrary, the absence of Sunday work, makes the men work far more conscientiously and the result is an increased output, which more than compensates for the time lost by not working on Sundays.

"Now, if Sunday work can be dispensed with at Chicoutimi, there is no reason why it should be permitted elsewhere.

"But quite apart from the economical point of view, the moral effect of Sunday work must be considered and it is undeniable that it has a most demoralizing influence on the workmen, for it practically cuts them off from all religious instruction and that is true whether the men work all Sunday or whether they cease work at 7 a.m. For in the latter case the result is practically the same."

Rules for Accident Prevention

In the annual report of the Chief Inspector of Factories for Ontario, the following rules for accident prevention, copied from the rules of the National Steel Car Company, Limited, are published:

Never try to shift a moving belt by hand.

Never go between or reach between large, fast moving belts.

It is your duty as well as your protection to report unsafe conditions to your foreman or the master mechanic.

A guard is placed solely on a machine for your protection. Don't operate the machine without the guard in place.

Stop machine before cleaning, oiling, wiping, or repairing it. Projecting belts and set screws may catch clothing and result in serious injury.

Don't try to operate a machine you don't understand.

Be sure to replace all guards when through repairing a machine. Think about the other fellow.

If you know of some machine not properly guarded, don't wait until some one gets hurt and say, "I told you so!" Tell the man in the shop before the accident happens and ask him to supply a proper guard.

Don't work with tools, machines or appliances which you know to be improper or defective, without calling their condition to the attention of the foreman or other proper person.

Don't swing sledge or hammer that you know is working loose on the handle, thinking it won't come off until the "next time." You may not be hurt, but what about the other fellow.

Never strike tempered steel with hammer or other metal object. Many eyes are injured or destroyed from this every year.

Don't leave tools, materials or rubbish in aisles or walk ways.

Remove or bend nails down before throwing boards aside. Never throw boards or material aside with nails extending upwards.

Avoid walking on railway tracks, and before crossing any track, "stop, look and listen."

Avoid jumping on any moving cars or engines; your work does not require it and you cannot afford to take the risk.

Don't fool with electricity. It is dangerous.

Don't wear loose, baggy clothing where it is liable to be caught in machinery.

Don't expect your helper to be as good a mechanic as you are. He is not, or he wouldn't be a helper. A little explanation as to the way the work is to be done may save injury to one or both of you.

It is easier to do a thing right than to explain why you did it wrong.

You are responsible for the safety of others as well as yourself.

Safety should be the first consideration of every employee.

Do things the way you are told, then if trouble comes, it is up to the Boss—you are paid to comply with rules. Have you any right not to comply? To be careless, thoughtless or reckless means injury sooner or later to yourself or others.

Editorial Short Lengths for Busy Readers

The town of Hearst, Que., on the line of the Transcontinental Railway was completely destroyed by fire on July 16th. Bush fires had been threatening the town for a long time and quite a serious fire occurred on June 9th, causing damage to the extent of $50,000. The fire of July 16th completed the work of the earlier fire and left practically nothing of the town behind.

The Minister of the Interior, Hon. W. J. Roche, in a cablegram to the office of the High Commissioner for Canada, under date of July 3rd referred to the crop situation as follows:—"With the crops making satisfactory progress, confidence in the future of Canada is becoming more pronounced. The Vice-President of the Canadian Pacific Railway Company says that, taking the country as a whole, the Canadian crop is making excellent progress, and with average weather conditions the largest quantity of grain ever harvested is in sight. Mixed farming appears to be taking hold of the country in a wonderful manner. The General Manager of the Grand Trunk Pacific Railway Company predicts the largest harvest on record for this year, and says that with the splendid harvest there will come an improvement in trade conditions throughout the Dominion."

Hon. W. R. Ross, who recently returned from a trip through New British Columbia, which is being opened up by the Grand Trunk Pacific, the Canadian Northern Pacific, and the Pacific Great Eastern Railways, is very enthusiastic in regard to the great natural resources of that part of the Province. Referring to the timber resources of the country, he said: "The lumbering industry will be a great factor in the development of this valley. The forest resources of the territory tributary to the Grand Trunk Pacific Railway have been generally underestimated. The reports of officials of the Department of Lands show that there are large areas of timber on the tributaries of the Upper Fraser which compare favorably with the best stands of pulp and lumber regions of Eastern Canada. The presence of this timber is hastening development. Lumber manufacturers, attracted by the high quality of the lumber for building purposes and tht short freight haul to the prairies, are now building saw mills, the number of which will, doubtless, be rapidly increased. The sawmill is an agency in settlement, and will play its part in this valley. Only a comparatively small portion of the merchantable timber in the Northern Interior has been disposed of under license, the remainder belongs to the public and constitutes a great source of revenue. Recently a sale of 1,918 acres of tinber was made, the estimated revenue being about $50,000, about $25 an acre, and a condition was made that the timber be removed within three years in order that the land may be released then for agricultural settlement. From the train en route from McBride to Fort George several mills were seen, one of the largest, at Willow River, having a capacity of 100,000 feet per day."

An interesting petition has been filed in the Supreme Court in the case of J. P. Marion, insolvent; P. L. Turgeon, curator; and J. and W. Duncan, Limited, petitioner. The petition alleges that by judgment in May last the curator was ordered to saw 8,000 logs lying at a mill at Bedard, Labelle county, which forms part of the estate of the insolvent. The petitioner claims that said logs are his property and should be delivered to him in a certain state under a contract. He alleges that the curator has not had the logs sawn as ordered by the judgment referred to and states that the latter has declared that he cannot comply with the court order. Petitioner declares that he is ready and willing to saw the logs and also to rent the mill and demands that the curator be ordered to give him the contract for sawing the logs and to lease him the mill in question.

Cross Ties Purchased During Year 1913

A Decrease of 6.7 per cent. as Compared With 1912—Over 16 per cent. Imported at Higher Price Than Paid for Native Ties

A bulletin which is being prepared by the Forest Branch of the Department of the Interior, deals with the consumption of cross ties in Canada during 1913. This bulletin is based on reports received from 47 steam railways and 32 electric railways purchasing ties in 1913. The total number of ties purchased was 19,881,174 valued at $8,470,849 and of this total, 3,254,587 ties valued at $1,827,358 were reported as having been purchased in the United States. This brings out the fact that Canadian railway companies import 16.4 per cent of their tie material and pay on an average 13 cents a tie more for this than for the native article.

Jack Pine and White Cedar in the Lead

The decrease in the number of ties purchased in 1913 was 6.7 per cent of the total for 1912. Out of twenty kinds of wood reported the two most important, Jack pine and white cedar, were reported in smaller quantities than in 1912, as were seven of the other kinds of wood.

The use of Douglas fir increased and formed 12.2 per cent of the total as compared to 10.2 per cent in 1912. The use of this wood has steadily increased since 1908. Four other British Columbia species, Western larch, spruce, hemlock and red cedar, all showed increases from 1912 to 1913. The eastern species of these woods all showed decreases during the same year. Oak ties, of which the greater part are imported were purchased in increased numbers but all the other hard woods with the exception of elm showed decreases.

The average price of ties of all classes was practically the same in 1913 as in the preceding year. The two most important woods were purchased at a slightly lower price than in 1912 and of the others, five showed increases and eight decreases.

A total of 19,490,491 ties or 98 per cent of all those purchased in Canada were used by the steam railways. This total is a decrease of 6.4 per cent from the total for 1912.

The ties imported for use by this class of companies amounted to 3,235,022 valued at $1,813,256 and formed 16.6 per cent. of the total.

The Jack pine ties were made up of two separate species, eastern Jack pine (Pinus Bankciana), which is cut in every province east of British Columbia and lodgepole pine which is cut only in British Columbia and western Alberta. Although this is one of the most widely distributed and abundant trees in Canada, the steam railways reported the purchase of 161,023 imported Jack pine ties coming from the United States.

This wood is used for ties chiefly because of its cheapness and abundance and the fact that it is fairly strong. Untreaten Jack pine ties decay very rapidly in the roadbed and the practice of treating them to prevent decay is becoming more prevalent each year. In 1913, 709,227 Jack pine ties received preservative treatment before being laid in the roadbeds of the steam roads in Canada.

Douglas Fir Ties Not Treated

Douglas fir ties are fairly durable and no treated material of this kind was reported in 1913. A small percentage (5.8 per cent) of the Douglas fir ties were imported from the Pacific States.

White cedar (Thuya occidentalis) is one of the most durable woods in Canada and has always been a favorite tie material although its softness makes frequent renewals necessary where the traffic is heavy. Most of the cedar ties used wear out before they decay and therefore preservative treatment is not necessary under prevalent conditions. White cedar ties are obtained in Ontario, Quebec and New Brunswick and 6.6 per cent of those purchased came from the Lake States.

Western larch or tamarack (Larix occidentalis) is a hard strong wood but one which is not so durable that preservative treatment does not effect a saving in its use. The wood is cut in British Columbia and 4.7 per cent. of the ties used in Canada in 1913 were imported from Washington and Oregon. Altogether only 3.4 per cent. of the larch ties were treated.

Eastern hemlock (Tsuga Canadensis) is cut only in the provinces east of Manitoba and is not considered a first-class tie material. All the ties of this wood were purchased in Canada and none were given any preservative treatment.

Oak Ties the Highest Priced

Oak ties were the most expensive on the list among the more important woods and were used for switch ties and on lines where the traffic was exceptionally heavy. By far the greatest part of the oak ties were imported 96.8 per cent coming from the United States, and were made up of a large number of commercial species. The fact that it pays to apply preservative treatment to a hard, strong and even durable wood like oak is demonstrated by the fact that the steam railways in Canada in 1913 purchased 525,623 treated oak ties, this number forming over half (54.3 per cent) of the total.

Hard pine from the southern Atlantic and Gulf States form an increasing proportion of the tie material imported into Canada each year. This wood does not grow in Canada and is the product of at least four different species of pines, the most valuable of which is long-leaf pine (Pinus palustria). The wood of the hard pines when used for ties usually decays before it fails through mechanical wear and therefore it repays the cost of a preservative treatment that will postpone this decay. Of the hard pine ties used in Canada by the steam railways in 1913, 17.5 per cent were treated.

Western spruce is made up of two species which are confined for the most part to the province of British Columbia. Englemann spruce (Picea Engelmanni) is found on the Rocky Mountains and in the eastern part of British Columbia and Sitka spruce (Picea Sitchensis) is cut on the Coast. All the western spruce ties were native material and on account of their rapid rate of decay in the ground 34 per cent of those purchased were given preservative treatment.

Eastern tamarack (Larix laricina) is very similar to the western species and has always been a favorite tie material on account of its spike-holding qualities. About half the tamarack ties were imported and none were reported to have been treated.

Western hemlock (Tsuga heterophylla) is usually considered to be a much better tie material than the eastern species, but in British Columbia where this tree grows it has so many rivals among the good tie timbers that it is not used to a very great extent at the present time. All the western hemlock ties were purchased in British Columbia and none were given preservative treatment.

Eastern spruce in Canada is made up of three different species that grow east of the Rocky Mountains. All the spruce ties were of native material and none were treated.

Chestnut (Castenea dentata) is one of the most durable woods of America although the wood is not to be classed among the hard, heavy tie materials. Practically all the chestnut ties were imported from the eastern States and none were treated.

Of the other hardwoods purchased such as, beech, birch and maple the greater part of the ties were treated before being laid.

Altogether about 12 per cent of the ties purchased by the steam railroads in 1913 received some sort of treatment to prevent decay.

Electric Railway Ties

While the electric railways in Canada in 1913 purchased only 2 per cent of the ties they paid the highest average price for their material.

The total for 1913 was a decrease of 19.1 per cent from 1912. The two cedar species in this class formed together three-fifths of the total, and Jack pine, which was the most important wood used by the steam railways was only of secondary importance. As a general rule the more durable, native woods were purchased by these companies and the treated ties formed less than one per cent of the total. Oak and cedar ties were imported in the largest quantities, together with all the hard pine, beech and maple. Of the oak ties reported 9.3 per cent were treated as were all the imported beech and maple ties.

The only western species reported were, red cedar, Douglas fir and western larch. These companies paid on an average 16 cents a tie more than the steam railways. This price was an increase of 8 cents from that of 1912, increasing with the cedars and with oak. All the other woods showed decreases in average cost.

Preservative Treatment

In Canada in 1913 about 10 per cent of the cross ties purchased by both classes of railways were given a preservative treatment to retard decay. The practice is a fairly recent one, as is seen by the fact that in 1910 practically no ties were treated at all and that the percentage of treated material has increased steadily since that time. The treatment under present market conditions is most profitable when applied to the harder, stronger woods that, if used untreated, would decay before the end of their mechanical life.

One of the handsomest catalogues which it has recently been our pleasure to receive is entitled "The Door Beautiful," issued by the Morgan Company, Oshkosh, Wis. This is the 7th edition to the catalogue and it contains an exceptional amount of extremely interesting information and illustrations. The illustrations are of quite a unique nature, each door is shown as part of an interior view of a house, giving a realistic idea of its effect when installed. The variety shown is wide and the designs are excellent. The catalogue also contains an attractive colored insert showing various finishes which may be secured on wood work recommended by the company.

Poles Purchased in Canada in 1913

Statistics Show Totals Vary Greatly Annually—Good Eastern White Cedar Decreasing

Reports received from 424 pole purchasers in Canada in 1913 were used as a basis for the statistics in a bulletin which will shortly be issued by the Forest Branch of the Department of the Interior. These pole purchasers consisted of 218 telephone companies, 155 electric light and power concerns, 29 electric railays, 18 steam railways and 4 telegraph companies.

The statistics have been divided into two main groups: first, those received from steam railway, telegraph and telephone companies, and second, those received from electric railway, power and light concerns.

The consumption of wooden poles in Canada varies greatly from year to year. There was a decrease of about 30 per cent in the numbers purchased from 1910 to 1911, an increase of 3.9 per cent from 1911 to 1912, and a decrease of 12.2 per cent from 1912 to 1913.

White Cedar Decreasing

Eastern white cedar (Thuja occidentalis) still heads the list as it always has in the past. The supply of good eastern white cedar poles, however, is visibly decreasing, as is demonstrated by the fact that at least 20 per cent of the poles purchased in 1913 were imported from the United States. The western species, red cedar (Thuja plicata) is more abundant and is now taking the place of the eastern species especially in the greater length classes. Poles of this wood are used extensively in the western provinces and more particularly in British Columbia where this tree grows. In the Prairie Provinces the poles are about half of the eastern species and half of the western. Of the red cedar poles purchased in 1913, over 8 per cent were imported from the Pacific States and were classed as "Idaho red cedar" although these are of the same species as those obtained from British Columbia.

Out of a total of 534,592 poles, 12.1 per cent were reported as having been imported from the United States in 1913.

While the total number was a decrease from 1912 to 1913 the total value showed an increase of 6.7 per cent caused by an increase in the average price amounting to $0.39.

Telephone, telegraph and railway companies operating telephone and telegraph lines used 87.8 per cent of all the poles purchased in Canada in 1913. This is a decrease in numbers of 14.6 and an increase in value of 0.3 per cent, the average value to these companies increasing by $0.26.

All the Jack pine, balsam fir, white pine, chestnut and ash poles were purchased by this class of companies.

Railway, Power and Light Purchases

The electric railway, power and light companies' purchases formed only 12.2 per cent of the total, but these poles cost on an average $3.68 more than those purchased by the telephone and telegraph companies.

The total number was an increase of 10.3 per cent over 1912, while the average price was an increase of $0.66. These companies imported over 5 per cent of the poles they used in 1913. They purchased all the cypress poles imported into Canada during that year and also all the western larch poles from British Columbia.

The average prices given for certain kinds of poles which have been purchased in small quantities cannot be considered as indicative of the intrinsic value of that particular wood for pole purposes or even as a fair gauge of its market value, as these individual prices are affected by so many outside conditions such as cost of transportation, size, etc.

The majority of the poles purchased in 1913 were less than 25 feet in length and of this class the two cedar species and eastern tamarack together formed over 97 per cent. All the chestnut and ash poles were of this length, and the eastern tamarack poles were more numerous in this class than those of western red cedar which is only true for this length class.

In the 26-30 foot class the two cedars formed together 98.9 per cent and tamarack poles became of little relative importance. While the cedar species still formed by far the greater part of the poles in the 31-35 foot class, poles of spruce become more important and cypress poles appeared in the 36-40 foot class and here red cedar became more important than white which is not the case with the shorter classes of poles. In the class of poles over 40 feet in length red cedar formed over two-thirds of the total.

W. B. Crawford, a well known real estate man and lumber merchant of the town of Wainwright, Alberta, recently disappeared from his home in a mysterious manner, and no trace of him could be found for a long time. Subsequently the body of Mr. Crawford was found at the bottom of a well on a farm about four miles from Wainwright, and all indications pointed to the fact that he had been murdered. The police are entirely without any clue as to the circumstances surrounding the case.

B. C. Timber Owner Hopeful of the Future

Mr. Fred Abraham, one of the largest holders of securities in the British Canadian Lumber Corpoartion recently expressed his views regarding the lumber industry and the corporation's holdings, as follows:—

The opening of the Panama Canal will mean a good deal to the western lumberman. The freight rate by rail from British Columbia to Montreal and New York is the same. A recent shipment to Montreal cost $27 a thousand feet. The price varies according to weight. It is never less than $20 per thousand, which would represent such lumber as cedar, and the price by rail will average $24. By way of the Canal, lumber will be laid down in New York and Halifax for $10 a thousand. It has been estimated as low as $8. Comparative prices will prevail to Montreal. The significance of these figures will at once appeal to the eastern consumer. The freight rate to European ports will be reduced to $12 to $15 per M. or half the present charge. The canal is now practically open to commerce.

There is a popular delusion in the mind of the always optimistic Canadian that we have in this country so much more coniferous saw timber than the United States that comparison is useless. I don't know how such an erroneous impression came to prevail. As a matter of fact it is less than one-fourth that of the United States, and fully half of this is in British Columbia. We have in Canada about six hundred billion board feet of saw timber. A good deal of the American product is in the northwest states. This is high grade timber and in quality is about the same as that owned by the British Canadian Lumber Corporation. This quality of timber in the States runs in price from $1.50 per M. up.

The holdings of the B. C. Lumber Corporation represent a purchase price of 69 cents per 1,000 feet. The limits were carefully cruised and at a conservative estimate there are at least nine billion feet of timber which at the lowest available market price of $1.50 per M. represent assets of $13,500,000. The company also owns milling property to the value of $2,500,000, which together with about a million dollars in lumber, logs, etc., a conservative valuation of their total assets would be $17,000,000.

A Recent Transaction

The company has about completed the sale of one of its mills for a million dollars, $750,000 in cash, the balance in twelve months at 6 per cent. Their current liabilities represent in round figures $9,000,000 preferred stock, $1,200,000 gold notes maturing in three years and current liabilities of half a million dollars which will be more than recovered out of the sale of its mill. This mill is being sold at a profit. The assets thus stand at $17,000,000 as against liabilities of a little over $10,000,000.

Nine-tenths of the company's holdings are in the wet belt, that is west of the mountains and on the coast where a constant moisture is driven inland by the Japanees current. A fire is practically unknown in this belt.

Standing timber, until sold, like any other similar investment cannot pay a dividend, notwithstanding the fact that the capital invested shows a large annual increase in value.

The holding and the milling of timber are two distinct businesses. Owners of timber limits cannot possibly lose money if they let their timber stand. It will increase from year to year, like well-located real estate, out of all proportion to dividends paid by the average industrial. There is a risk in the milling of timber and only those who are able to give it the closest personal attention make it pay. It is the present policy of the B. C. Lumber Corporation to create a holding company, disposing of their mills at a profit. Standing timber has never declined in value the world over. Favorably situated, as on the Pacific Coast of British Columbia, standing timber will enormously increase in value from year to year.

European Supplies Shrinking

Available timber in Europe is becoming rapidly exhausted. Lumber dealers are bringing it from long distances at great cost. One of the largest, if not the largest, dealers in Europe is now compelled to transport his timber by way of rivers, etc., a distance of nine hundred miles before it reaches the Russian sea board from which ports it is shipped by boat to English and other European markets. The available supply of this firm's timber is practically exhausted. So much so, in fact, that they have offered our company an advance of ten per cent on the price fixed by the B. C. Lumbermen's Association, for our entire output, which offer will be declined because of the Corporation's expresesd policy of converting their company into a holding one.

Pulpwood Destroyed on Anticosti Island

A report from Anticosti Island under recent date said that for several days a fire had been raging in the bush near Ellis Bay, Anticosti. Great havoc had been wrought in the pulpwood area, about seventy thousand logs having been burned, the loss on which will run into thousands of dollars. All the available men in the district were fighting the fire, but with little success. It was feared that the fire might continue until a heavy rain came, and if high winds should occur the situation might become very serious.

Wider Markets Necessary for B. C.

Production Capacity Double the Annual Sale—Information Prepared by Forest Branch for Dominions Commission

The area of British Columbia is 243,000,000 acres. Practically the whole of the Province is wooded. About 30,000,000 acres are covered with accessible merchantable forest of valuable species.

The forest has in the past suffered severely from fire. A young forest now covers about 90,000,000 acres of old burns. This young forest is composed of valuable commercial species, and will reach commercial value in 20 to 60 years.

The estimated stand of mature timber in British Columbia now is 350,000,000,000 feet board measure.

The greater part of the timber is very accessible to transportation. A large part of it is easily accessible from the 7,000-mile protected coast line where are many natural deep water harbours. The remainder can be floated by lake or river to points on railways now constructed.

The most valuable timber for the cargo trade is found adjacent to salt water within convenient reach of harbours. The lower grades of timber used chiefly in the prairies are found in the valleys of the interior rivers, and are floated to the various railways serving the prairies.

Two-thirds of the annual cut comes from with 5 miles of salt water on the shore of the mainland and neighbouring islands within 150 miles of Vancouver. The other third is chiefly from the valleys of the rivers in the south-eastern corner of the Province.

The present annual cut for all uses is 1,750,000,000 feet valued at about $30,000,000.

The annual growth on the forest area of the Province is estimated to be between 6,000,000,000 and 7,000,000,000 feet. The annual growth may be treated as a permanent crop. The non-agricultural lands of the Province, whether now covered with merchantable forest or young growth, are being protected from fire and will produce this amount of timber annually in perpetuity.

The important timber species are:—Douglas fir, red cedar, hemlock, Sitka spruce, white Englemann spruce, western hemlock, yellow pine, white pine, yellow cedar, lodgepole pine, tamarack, balsam fir, and yellow cedar.

These species exist in sufficient quantities to supply any trade continuously. They may be furnished in any sizes the trade could reasonably demand. From amongst them may be secured timber for almost any use; very strong, for any class of construction, heavy or light; durable, for use where decay is rapid; with the qualities of working, beauty of grain, adaptability to polish, which fit them for use in the interior furnishing of first-class residences, offices and banks. British Columbia timber will furnish every need for houses, railroads and public works, roofing, pulp, paper, furniture, cooperage, packing cases, mine timbers, boat building, railroad sleepers and cars, wood-block paving, etc.

Extent of the Industry

There are now 800 logging camps, 400 saw mills and shingle mills, and 4 pulp and paper mills in British Columbia, in which are invested $1,000,000,000. The possible annual output is 3,000,000,000 feet. The labour directly employed when running at full capacity is 140,000 ali men. The value of the product would then be $45,000,000.

The products manufactured in the order of their importance are lumber, shingles, paper and pulp, rough articles such as poles, piles, posts, mining props, and smaller manufactures such as sash, doors, baxes, shooks, and cooperage.

The mills and logging camps in British Columbia have not during the past three or four years been able to run at full capacity. There has not been sufficient demand for lumber.

The effect of present conditions in the lumber market is felt on investments in the Porvince, traffic on railroads, the demand for labour, the market for food and household staples, machinery and produce. Agricultural settlement is affected, as the lumber industry clears the land, furnishes the farmer with employment in odd seasons, builds roads, and affords a profitable market for farm produce.

The capacity of the mills and camps is 3,000,000,000 feet per year. The sales from mills in 1913 were about 1,500,000,000, one-half the possible. This is the argument for wider markets.

Present Markets

The annual cut the past two or three years has been distributed as follows:—

British Columbia domestic demands over one-fifth of cut;
Prairie Provinces domestic demands over three-fifths of cut;
Other buyers in this order:—

Less than one-fifth of cut.	Africa
United States	China and Japan
Eastern Canada	South America
Australia and New Zealand	Europe

The leading features of the British Columbia situation are:—

1. The provincial forests will support in perpetuity a cut 4-5 times as great as the present annual cut.
2. The merchantable woods exist in great quantities, and are suitable for practically all important uses.
3. There is money invested, camps and mills erected ready to take advantage of markets.

Briefly, the causes of lack of trade with the timber importing sections of the Empire are:—

1. Lack of information about British Columbia timbers.
2. Freight rates and transportation difficulties.
3. British Columbia mills, while numerous and of large aggregate capacity, are not built and located so as to handle a large cargo trade. They are built chiefly with an eye to the railroad trade.

Prompt annual statistics showing the quantities of different forest products produced, and their value, are necessary. Such statistics wili henceforth be gathered by the Provincial Forest Branch, which, because of its close contact with the industry, is in a position to get complete and accurate information. These statistics will be compiled for the calendar year.

A survey of the forest resources of the Province is in progress. This will form the basis of statistical information on the amount of timber available.

Periodical exhibitions, including timber, in the United Kingdom and Dominions would undoubtedly help the timber trade. Advantage could be taken of such exhibitions to show the variety, qualities and uses of British Columbia timber in such a manner as to appeal to engineers, builders and manufacturers.

A permanent exhibition in London would serve the same purpose.

Who Can Give Us the Right Answer?

Editor Canada Lumberman: Grand Forks, B.C., July 7.

I would like to have the views of your readers upon the following:

There is always something wrong with the lumber business. It is no reflection on the lumbermen for they are always ready to admit it. Why is it?

When trade begins to develop the lumberman is like a man arising from a bent pin; he ships a few cars and wires his salesmen to grab everything in sight, or he writes to his customers and asks them to buy his finish lumber for kindling prices.

Have the lumbermen lost their balance wheels?

Let them stop and think (if it will not hurt too much) and consider what it would mean to the trade if everyone were to stop trying to sell lumber. The same quality of lumber would be used and a profitable price obtained for it.

THE WAY TO SELL LUMBER IS NOT TO TRY TO SELL IT AT ALL.

Will some millionaire lumberman (if there are any) appoint a missionary, wise and gifted, to visit the sales managers of the largest mills, impressing on them, for the sake of the entire trade of the Dominion of Canada, this fact:

THE WAY TO SELL LUMBER IS NOT TO TRY TO SELL IT AT ALL.

This is the cornerstone, and if all salesmen were educated along this line it would mean a short and sure road to success. The scheme will work. Let everyone try it for six months.

My advice to all lumbermen and the policy of our company is reflected in the following short phrase:

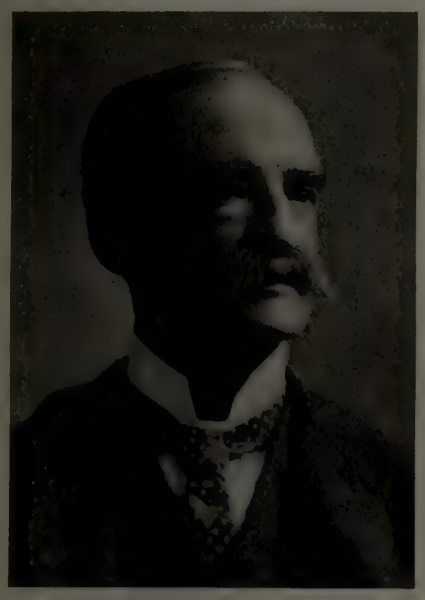
QUIT TRYING TO SELL IF YOU WANT TO DO BUSINESS.—W. Mark DeCew, Vice-President and Manager, Western Pine Lumber Company, Limited

Recent B. C. Timber Sales

Several timber sales were completed during the month of June. W. C. Palmer, Lund, B.C., purchased timber in the New Westminster district as follows:—494,000 ft. of Douglas fir at $1 per M. ft.; 20,000 ft. of hemlock at 50c per M. ft.; 250,000 ft. of cedar at $1 per M. ft.; total price, $1,234.40. J. A. Waters, c/o Vancouver Timber & Trading Company, Vancouver, B.C., bought timber in district "R.I. coast" amounting to 300,000 ft., with the right to cut all the merchantable timber, at $1 per M. ft.; total price, $520.75. Michael Crane, Victoria, B.C., bought timber in the Sayward district as follows:—1,589,000 ft. of Douglas fir at $1 per M. ft.; 734,000 ft. of cedar at $1 per M. ft.; 489,000 ft. of hemlock at 50c per M. ft.; 150,000 ft. of spruce at $1 per M. ft.; 17,000 ft. of white pine at $1 per M. ft.; total price, $4,510.05. Each of the above purchases was subject to the royalty of 50c per M. feet in addition to the price paid.

A Pulpwood Export Pioneer

Mr. A. J. Auger, of the wholesale lumber and timber firm of Auger & Son, Quebec, is a pioneer in the export of pulpwood to the United States. Naturally there were many initial difficulties to overcome, but the enormous trade in this product shows that there was a valuable opening for the Canadian wood. Mr. Auger has been in the lumber business all his life. He was born in 1841. After leaving school he was employed as an accountant with a lumber firm. Later he was engaged in the management of driving operations to the port



A. J. Auger, Quebec

A. G. Auger, Quebec

of Quebec, the timber being required for export to European and American markets. From 1886 to 1874 Mr. Auger was engaged in business in Montreal. In the latter year he removed to Quebec, where he has since conducted a wholesale business, chiefly in the way of export. The firm also make a specialty of railway ties, pulp wood, and cedar poles. Notwithstanding his advanced years, he still leads an active life.

Mr. A. G. Auger, son of the principal partner, has been associated with the business from an early age. He has been especially interested in investigating fresh markets for Canadian lumber, and has done much towards extending the operations of the firm.

Sorting the Ottawa Drives

For generations the Ottawa has been the foremost lumbering stream in Canada, and still the men who work on the sorting booms in the river above the falls of the Chaudiere, where are situated the biggest of the Ottawa's many mills, say that the drives of logs passing through their "gaps" are as large to-day as ever. Thomas Gillespie, for example, who has been boss of the sorting gang at Thompson's Bay for 35 years, says he doesn't see much difference in the number of logs in the river these days, however much difference there may be in the size of them. He is a veteran of the time when the square timber rafts sailed the Ottawa in the full tide of their glory. There are no more timber rafts now. The last timber crib has shot the slides at the Chaudiere.

Most of the logs that they make now would not have been considered worth taking out of the woods in the good old "timber" days. But such as they are, they keep on coming—pine, spruce, tamarac, pulp. The Ottawa is full of logs, from the head waters above Temiskaming right down to the lower river below the falls. Nor does one summer see all these Ottawa drives through to the mills. It takes two or three years for some of the drives to get down. In fact, certain firms, like J. R. Booth, have continuous processions of logs afloat, all the time, some of the pieces having been on the way to the mill for years.

From some far creek away up on the Hudson Bay Height o' Land, where they were dumped on the ice originally one spring, down through all the ramifications of the tributary streams, little and big, until finally the "grand" river was reached, the journey for some of these water-worn, rock-peeled logs, has been a rough succession of rapids and tumbling waters, and ice and drifting snow. In the spring they would move out of their winter quarters with the high water and travel another stage of their journey. At a rapids late in summer it might happen some of these brothers from the distant pinery would be stranded on the shallow rocks and hung up again for another winter. In some cases the Ottawa "sweep" comes along and picks off such laggards, sending them on down the current. But some they miss, and it is said that though Hon. George H. Perley has been out of the lumber business for years it is not uncommon for Perley's logs to be found in the sorting gaps even yet. As for the logs that sink, drift into blind channels, get chopped up for firewood by the habitants of the Ottawa Valley, or lost, in one way and another in the great river—who knows? Certainly not Thomas Gillespie, the boss of the sorting gang at Thompson's Bay.

"Lord only knows," says he.

Out in the middle of the wide current of the Ottawa stands a two-storeyed house on a crib some four or five feet above the water which its varandah overhangs. Around the house spread out fields of floating logs like a farm. Paths run across the expanse, and booms are stretched across like fences. Every morning the men go off to work, their pike poles over their shoulders, marching these floating paths in the middle of the river. Two logs strapped together with pieces of scantling and faced with a couple of planks form these river sidewalks, but they are only the main roads, for the men take to the boom timbers at times, or, if need be, they walk the loose logs without hesihesitation. Their boots are caulked with half-inch spikes. One steps on a log and it does not roll; it sinks, maybe, if it is a small one, but the river man steps on to the next one before his foot goes down.

All these logs above here have been floating since last year. They were liberated by the spring thaw and have come down from Lake Dechenes and the rapids. This year's logs won't be at the sorting gaps for a while yet. A boom stretches across the river holding back these old logs until they have been sorted according to the brands of their owners. This is the work of the sorting gangs, and the purpose of the sorting "gaps." There are several places where the logs in the Ottawa are sorted—in fact once they strike the main river they are sorted at almost every stage of their journey, each mill taking its quota from out the mass as it passes. The work of sorting and of keeping the drives in the main river moving is undertaken by the Upper Ottawa Improvement Company, composed of various owners of logs in the Ottawa, who associate themselves to drive co-operatively instead of as individuals, thus saving an enormous amount of expense. They build the slides at the falls and rapids, manage the booms, and sort the logs according to the brands and the species of timber.

The "sorting gap" is simply a gap in the boom which holds back the "jam" a gap of some fifty feet across. It is bridged some two feet above the water by three long planks. A little lower down another bridge goes across the gap, and the channel between these two bridges is boomed off like a roadway. All the logs to be sorted have to come through this narrow channel under the two bridges. On each of these bridges three men stand with pike poles. Men are stationed above to send the logs into the gap, and they have to be men active on the "loose," for they cannot do their work and stay on the solid boom.—S. H. Howard in the Toronto Star Weekly.

Opening Up Quebec's Pulpwood Areas

Sir Lomer Gouin, Premier of Quebec, who returned recently from a tour of inspection of the Abitibi region in Northwestern Quebec, is enthusiastic about the prospects of the region. He says that settlers are rapidly taking up the land on either side of the National Transcontinental Railway, and that the land, when cleared, is equal to the finest Manitoba lands for agricultural purposes. This land is all within the Clay Belt, and is covered with timber. It is expected that, as a result of the rapid settlement, large quantities of pulpwood will be put upon the market to be brought out when the railway starts operation next fall. Sir Lomer anticipates the establishment of large pulp and paper industries in this country, as pulpwood and water powers abound. It will be recalled that the Quebec government has decided to sell by auction, on August 11 and October 20, permits to cut timber on over 8,000 square miles of Crown lands in the districts opened up by the National Transcontinental Railway. The limits comprise 1,200 square miles in the basins of the rivers Ottawa, Harricana and Bell, in the Abitibi region; 6,000 square miles in the Lake St. John northern region; 350 square miles in the Lake St. John East agency; and 240 square miles in the Matapedia division.

Quebec Cullers' Report

The following comparative statement of timber, etc., measured and culled is furnished by the Supervisor of Cullers' office, Quebec, under date of July 9th.—

	1912. Cu. Ft.	1913. Cu. Ft.	1914. Cu. Ft.
Waney white pine	227,280	121,400	384,240
White pine	80	40	.....
Red pine	1,320	680	.....
Oak ... ..., ...	10,000	47,680	184 320
Elm	200,520	163,920	253,200
Ash	120	840	600
Birch and maple	38,640	47,680	50,800

Mr. R. H. Campbell, Dominion Superintendent of Forestry is making a study of afforestation methods in Sweden and German

Thinks the Wholesaler is Unduly Alarmed

Editor Canada Lumberman: Udney, Ont., July 11.

In this vicinity the demand for lumber is as good as last year. The reason, I believe, is that most of our customers are farmers, and farmers do not shut off their outlay on improvements as suddenly as mercantile men in the event of money stringency.

The wholesale buyers seem to be frightened to invest in lumber stock and we have some stock left on our lands with the cash deposit from the wholesaler, which we have since sold at retail quite readily at the usual price.

It is my intention to get out all the lumber stock I can during the coming winter and I feel sure there will be very little, or no discount on the present and past values of lumber.—H. Oliver.

New Bishop's Crossing Mill Under Way

Editor Canada Lumberman: Bishop's Crossing, P.Q., July 13.

Owing to the very slack trade in lumber, especially in hardwoods throughout this section, our plans have been considerably retarded and somewhat altered for the present season. As we put in no logs last winter we were not obliged to rush rebuilding. We have the main building well under way however, and will expect to have the sawmill in order for the winter operations, providing the trade conditions and the money market show some improvement.—J. O. Gilbert & Son.

Business Better Than Ever Before

Editor Canada Lumberman: Tweed, Ont., July 11.

We have no reason to complain of lack of business. Nineteen hundred and thirteen was our best year, and business this year is running about 10 per cent better than last year. Our greatest difficulty is to get experienced men to get out the work, although unskilled labour is a little more plentiful than usual. In this district all lines of business are in a very prosperous condition.—The Houston Company, Limited.

Nova Scotia Trade Contiuues Quiet

Editor Canada Lumberman: Bridgewater, N.S., July 14.

We are still running about as usual. Our cut will probably reach about forty or fifty million feet this year, and we have our troubles the same as the balance of the lumbermen. Conditions are quiet and prices are low. We are, however, pretty well sold up for the year, and do not expect to have much surplus stock to carry over—Davison Lumber Company.

Panama Canal May Open German Market

The opportunity for opening and developing a trade in Canadian lumber in Holland and the principal Rhine cities supplied through the port of Rotterdam has recently been the subject of investigation. A large number of importers have been called upon and their views ascertained. It is the general consensus of opinion that until a lower freight rate obtains a competition in Oregon pine (Douglas fir) with the pitch pine and Carolina pine of the Southern States will be difficult. With the opening of the Panama canal however, importers look forward to a decrease in freights, and anticipate a considerable increase in the importation of lumber from the western coast of the continent of America.

Mannheim is the largest lumber market in the Rhine provinces, and supplies practically the whole of Southern Germany. The largest lumber importers advised that Oregon pine is used for windows, doors, flooring, and furniture.

Dimensions for flooring are as follows: Rift cut, 1-inch x 4 inches, 1¼ inches x 4 inches, 1½ inches x 4 inches; width, 5 inches to 12 inches; length, 12 feet and upwards.

Dimensions for carpenters' purposes are as follows: One inch, 1¼ inches, 1½ inches, 1¾ inches, etc., to 3 inches; width, 10 inches and upwards; lengths, 12 feet and upwards.

Dimensions for furniture are as follows: One inch to 3 inches thick; width, 9 inches to 10 inches and upwards. It is at present too expensive in comparison with pitch pine and red pine imported from the Southern States ,and for the past two years only small quantities have been received. Pitch pine flooring is at present quoted £18 per standard; pitch pine sap rifts, £16 per standard c.i.f. Rotterdam. If Douglas fir, rift cut, can be laid down at £15 to £16 c.i.f. Rotterdam, it will compete successfully. The usual terms are cash against documents 2 per cent discount, or 75 per cent against documents and 25 per cent after arrival.

Firms in Seattle, Tacoma and Portland are at present quoting prices in this market, but all firms interviewed state that they will be pleased to receive quotations from Canadian exporters.

One firm is anxious to receive samples of cedar, and also prices for the following dimensions: Cedar, square hewn, minimum 16 inches x 16 inches; length, 12 feet to 30 feet or 40 feet; average length about 20 feet. Free of knots and sound.

B. C. Forest Branch Revenue

The total amount of forest revenue in British Columbia for the month of June, 1914, was $157,919.19 made up as follows:—

Timber licence fees	$112,034.10	
Timber licence transfer fees	1,510.00	
Timber licence penalty fees	555.00	
Timber lease rentals	6,550.65	
Timber lease transfer fees	10.00	
Timber royalty	27,228.31	
Timber tax	4,238.35	
Timber bonus	1,675.45	
Scaling fees	2,317.44	
Scaling expenses	168.23	
Trespass and penalties	73.90	
Timber sales rentals	260.29	
Scalers examination fees	70.00	
Handloggers licence fees	975.00	
Timber mark fees	48.00	
Copies of documents	29.00	
Timber sales advertising	69.50	
Timber sales cruising	100.00	
Exchange	5.97	
		$157,919.19
Collections for the forest protection fund from timber licences, lessees, etc.	11,999.59	
Contributed by Provincial Government	11,999.59	
		23,999.18
Forest protection expenditure during month of June, 1914, was		25,665.58

The quantities of timber scaled and exported during June, 1914, were as follows:—

District	Sawlogs No. of Feet B. M.	Piles and Poles No. of Lineal Feet	Rly. Ties, Shingle Bolts and Cordwood No. of Cords.
Vancouver	51,445,242	170,884	3,783.01
Vancouver, exported	3,870,603	90,100	.....
Island	12,197,638	101,766	1,732.00
Island, exported	351,726	90,420	.....
Kamloops	1,815,747	89,119	1,219.16
Cranbrook	12,570,972	189,020	7,803.47
Nelson	7,494,854	257,115	1,986.43

Hazelton	449,000	16,470	5.50
Tete Jaune Cache	.....	.....	1,217.50
Total scaled all districts	92,524,071	864,761	19,342.53
Total exported all dist.	4,222,329	180,520	.....

Flood Damages New Brunswick Mill

A remarkable cloudburst, followed by an enormous flood, did damage on July 18th in Kings County, N.B., the principal loss being in the valley of the Millstream, down which the enormous flood swept, tearing away bridges, piers, booms, etc. The damage is estimated at more than $300,000. The flood tore away 1,250,000 feet of logs, which were in booms at Jones Brothers' Mill, Apohaqui. Jones Brothers are the heaviest losers. Their logs were scattered along the banks of the river and the end of their mill was badly damaged. Later reports state that Jones Brothers have recovered 600,000 feet of their logs, and will be able to keep their mill running during the summer, as the remainder of the logs will be secured, although at a heavy expense.

Crews are at work repairing the damage to the mill and assembling the drift logs which are scattered for seven miles along the river as far as Norton, where a jam occurred. New slips are being built at the mill, and a boom has been swung from the broken parts of the old log guards. Never before in the history of the district has such a disastrous flood occurred. The meadows along the Millstream were covered by water to a depth of four feet, and in two and one-half hours the water had swelled to ten feet above the normal surface of the stream. The total freshet rise was twenty feet in five hours. A rapid fall of water has been going on since the storm ceased, and conditions are now almost normal.

Honors for R. H. Campbell

Honorary membership in the Royal Scottish Arboricultural Society was conferred upon the foreign and Colonial delegates attending the Diamond Jubilee Conference of the society at Edinburgh recently. Among those honored was Mr. R. H. Campbell, Director of Forestry for Canada. Mr. Campbell, in replying, referred to the keen sympathy which the Canadian Government had displayed in regard to forestry work throughout the Dominion.

Experienced Shingle Men Form New Company

In a recent issue reference was made to the fact that the Port Haney shingle plant had passed into the hands of new men, and would be operated in future as the Barclay Shingle Mills, Limited. J. A. McKercher, Vancouver, a well-known lumberman, controls a one-quarter interest in the new company and associated with him are W. J. Barclay and Thos. Paradis. Mr. McKercher has been connected with the lumber and shingle business at the coast for a number of years, having been manager of a large plant on False Creek until its destruction by fire. He then organized the Nanoose Bay Lumber & Shingle Mills on Vancouver Island, which plant was disposed of about a year and a half ago to an English syndicate, who are now operating as the Newcastle Lumber Mills, Limited. Mr. Barclay has been connected with the lumber industry on the Coast for the past twenty years as expert filer and mill superintendent. Mr. Paradis was office manager for Mr. McKercher, and has a thorough grasp of the shingle business in all its details. The capacity of the company's plant is now being increased to 200,000 shingles per day, and negotiations are under way for the purchase of a second plant, to be carried into eeffct as soon as an adequate supply of timber for both plants has been secured. The Haney mill is now operating to full capacity, the superior grades of shingles turned out finding a market in Ontario and on the prairies. The adertisement of the company appears elsewhere in this issue.

The New Bathurst Sulphite Mill

Preparations for the erection of the proposed sulphite and board mill of the Bathurst Lumber Company, are going rapidly forward under the direction of Mr. A. G. McIntyre. This mill will be built of concrete and steel, and will manufacture 25 tons per day of bleached Mitscherlich sulphite pulp, and 60 tons per day of steamed container board. This mill will later be enlarged to a news and ground wood mill. It is located at the mouth of the Nepisiguit River, on Bathurst Harbor, N.B., and has railway and ocean connections. The company owns 2,800 square miles of timber lands attributary to the mill, and has the best storage ground for logs, in Bathurst Harbor, on this continent. The wood cut on these limits, is at least 80 per cent black spruce, which is the best paper making fibre there is. The small wood will be used in the pulp mill, the large logs will be sawn at the company's two saw mills on Bathurst Harbor, which are sawing 250,000 feet of lumber per day. It is expected that the mill will be in operation some time next summer, about July or August.

B. C. Having Few Forest Fires

Mr. H. R. MacMillan, chief forester for British Columbia, reports that only a few small and unimportant fires have as yet occurred as a result of the dry hot weather. If this weather continues however, he fears, that serious conflagrations will develop. The rangers in the various districts of British Columbia this year are better equipped than ever before for such emergencies and hope, with the cooperation of settlers, that there will be few, if any, disastrous fires this summer. During the first week in July a number of small fires were reported. The largest were at Natal and South of Jaffray, B.C. In the former case the fire was extinguished without damage to any timber, after a hard fight. For a time, it looked as though the limits belonging to the Wilson Creek Lumber Company would be damaged. The fire at Jaffray extended over 300 acres of slash from logging operations on the east bank of the Kootenay River. This fire was got under control before any damage was done to the timber. A set of logging camps which had been abandoned was destroyed.

Lumbering Conditions in June

The Dominion Labor Gazette in its issue for July 1st, reports as follows:—"Lumbering operations on the whole were fairly brisk. Nova Scotia reported a successful logging season, and all lumber was brought safely to the mills. In New Brunswick also mills were working steadily with large crews. In some parts of Quebec and Ontario, owing to low water, many logs were left behind, not only in the small streams but on some of the larger rivers as well. In spite of the fact that the last winter was a favorable one for logging and larger quantities than usual were taken out, it was expected that the number of logs likely to be left in the woods and the prospect of a reduction in the sawing season would have a tendency to increase the prices of lumber, the demand for which, particularly in the cities, was greatly improved."

Handling Architects' Specifications

Architectural specifications, either of the individual architect or accompanying plans that are gotten out wholesale from architects' drawings and specifications, are becoming an important factor in planing mill work, and sometimes one feels inclined to regard them as a sort of mixed blessing. There is no question but they are a step forward and make for individuality and new ideas and improvements in home-building, but the carrying out of architectural specifications to a great length of detail is in some measure the same as adopting system and carrying it out to the points of entangling red tape. It does not leave anything for the judgment to exercise itself upon, and tends in a way toward neglecting, through inactivity, those faculties of the workman which make him comprehend his work as a whole, and, through this comprehension, use his best judgment to get proper results. In other words, it is something like a factory where the work has been systematized and each man simply does a given part of the work and concentrates his interests on that part, by means of which he becomes more or less a stranger to the work assembled as a whole. He acquires accuracy and capacity thorugh this means, but loses a grasp and comprehension of the work when grouped together, that is a loss hard to make up for.

However, what is specifically in mind now concerning handling architects' specifications, is not so much a discourse on the folly of carrying them to extremes as to point out some of the stumbling blocks a planing mill man may fall over if he is not careful. The majority of contracts for work involving architects' specifications have a clause setting forth that anything which shows in the blue-prints, but is not named in the specifications is to go in just the same. On the other hand, if the designer neglects to show something in the blue-prints, but it is included in the written specifications, it becomes a part of the contract. So a man must scan very carefully not only the plans in detail, but also the specifications, to see if there are some items on one that do not show on the other.

There is an instance in mind now where it cost a planing mill man about $50 on a job because a certain feature of the work did not show in the blue-prints, but was set forth in the specifications, and was overlooked. Now, if this man had been given the contract for the structure in question, he would have pictured the whole job complete in his own mind when figuring on it, but when working from the architects' specifications it got to be a matter more of narrow mechanical figuring than of broad thinking, and the estimate was made and the work done from the things visible in the blue-prints themselves, without giving any thought to what might have been left off. There is many a job in which it would probably be better for the planing mill man with a shop of any great extent to supply plans and specifications out of his own drafting room equipment, rather than follow carefully some of the immaterial details of special plans brought in at times to work from.

This is a matter that is in a peculiar stage of development right now, and it is a little difficult to see just what the future will bring—whether there will be an extension of architectural work in connection with planing mills themselves, or whether they will take to letting all the designing and specifying entirely to architects.

Concatenation of Hoo-Hoo to be Held at Toronto

R. M. Webb, Vicegerent Snark for Eastern Canada, is making arrangements for holding a concatenation of Hoo-Hoo at Toronto about the end of August. He is receiving enthusiastic assistance from Toronto members, and expects to break a few records and bring off a big event. All Hoo-Hoo in Eastern Canada should join in making this a fine concatenation. Coming just before the annual meeting of the order at Winnipeg, it should result in stirring up interest in the latter important event.

Trade Enquiries

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names of enquirers by writing to the Department of Trade and Commerce and stating the number of the enquiry.

616. **Douglas fir.**—Responsible lumber importer in Cologne will be pleased to receive samples with the idea of opening up a connection with Canada.

619. **Douglas fir.**—A Mannheim importing house wishes to receive samples and prices, delivered c.i.f. Rotterdam.

621. **Douglas fir, British Columbia cedar.**—Quotations for the above with samples are desired by a Mannheim importing house.

622. **Douglas fir, British Columbia cedar,hemlock.**—A reliable Mannheim importer wishes to enter into correspondence with Canadian exporters of above.

623. **Douglas fir, redwood, hemlock.**—A Mannheim importing firm is prepared to receive samples and quotations from Canadian exporters.

624. **Douglas fir, red pine, spruce, cedar.**—A Mannheim importer wishes to enter into correspondence with Canadian exporters of above woods.

626. **Douglas fir and British Columbia cedar.**—A large importing house in Dusseldorf desires samples and quotations.

628. **Oregon pine and British Columbia cedar.**—A Dusseldorf importing house solicits correspondence in connection with above.

630. **Douglas fir, spruce, hemlock, cedar.**—An importing house in Dusseldorf is prepared to enter into correspondence with Canadian exporters.

656. **Box shooks.**—A South African importer asks for f.o.b. quotations on Canadian-made Box shooks.

657. **Pine doors.**—Inquiry is made by a South African importer for quotations on Canadian pine doors.

658. **Lumber, planed and grooved.**—A South African firm asks for quotations on Canadian lumber, planed and grooved.

Closer Utilization of Timber Products

Losses Which Occur in the Various Stages of Converting Timber Into Lumber—Suggestions of Ways for Reducing the Waste

By R. C. Bryant*

CLOSER utilization of the raw products of the forest is becoming more evident each year, although in all sections there are operators who still ignore the profits which may be made from material they now waste. As in the meat industry in the early days, the only product saved was the beef and hide, so in the lumber business to-day the majority of the loggers and manufacturers take only the standard length lumber and to a large extent fail to utilize the various by-products such as "shorts," sawdust, slabs, etc.

Although there has been much unjust criticism of lumbermen because of the methods they have employed in harvesting their timber, it is true that large quantities of raw material have either been left in the forest to rot, to furnish fuel for forest fires, or have been burned in the incinerator at the mill. However, in nearly every case where this has been true, the chief reason could be found in the low prices obtained for the manufactured material. For years knotty, defective and small trees could not be made into lumber and sold at a profit. Lumbermen, as a rule, are as keenly alive to their interests as men engaged in any other industry and it is folly to assume that they would wilfully neglect an apportunity to manufacture lumber that could be marketed at a profit, especially since much of the material that was left behind in the forest or was burned at the mill had to be handled in some way before it was abandoned. During the early years good material was used for the construction of roads, skidways, camps and like purposes when inferior timber was available, but the logger preferred the choice timber, since it was both cheap and could be worked to better advantage.

A recent writer has charged present-day lumbermen with gross waste, claiming that more than 50 per cent of the raw product is wasted during the progress of logging and manufacture. Such statements are misleading to those not fully acquainted with conditions. The author of the article undoubtedly misinterpreted the figures he quoted, which appear to have been taken from a publication of the Forest Service. These figures are not based on the merchantable content of the tree but upon the total content, including bark, stump and limbs, all of which, with certain exceptions, are not merchantable. In addition the amount of necessary waste is increased by the loss of wood due to sawdust, slabs or defects which render the affected portions of the bole of little or no value.

Loss in Forest and At Plant

The actual loss of the raw product occurs both in the forest and at the manufacturing plant. In the forest it has been estimated to be as high as 25 per cent, although it is constantly being reduced by improved methods of operation and higher market values for the low-grade product.

The chief wastes in the forest have been, and are, due to the cutting of high stumps; the careless cutting of the bole into logs, both as regards length, crook and defects; leaving merchantable timber in tops, logs and standing trees; breakage in felling; and loss in transport, especially in log driving.

Stumps are now being cut at a reasonable height on most operations. There is still insufficient attention paid to securing both quantity and quality from the felled timber. The serious losses which often occur in cutting crooked logs, in breaking timber in felling, and in leaving an excessive amount of timber in the tops could be largely remedied by proper supervision. However, timber may be perfectly sound and yet be so knotty that it cannot be brought out as a profit, due to market conditions. As a rule, however, it is possible to secure more merchantable timber from the tops than is usually taken.

Saw Mills on Flat Cars

The author firmly believes the time will come in the near future, in those sections of the country where logs are brought from the forest to the mill by rail, when it will be possible to install small portable saw mill plants on flat cars which can be taken to the forest and there used for sawing very crooked logs and knotty tops into material suitable for novelty and similar work. The coarse material, very crooked logs and broken boles can be cut into short lengths, four feet or more long, and corded up along the railroad track after the regular logging crew has removed the saw timber destined for the large mill. The small mill can then be taken to the site where the timber is stacked, the logs elevated by power onto the car, and sawed into lumber. This material would furnish large quantities of narrow widths and short lengths of choice stock, provided the large knots were removed.

One reason why operators have failed to handle knotty logs in the main saw mill has been the low sale value of the product, coupled with the high cost of manufacture incident to their utilization. The knots on rough logs are tough and dull the saw teeth quickly, so that the timber must be fed against the saw at a slower speed than logs without knots—this means increased cost of manufacture—and further when clear logs are placed on the carriage the saw is not in condition to manufacture good lumber. This effect could be obviated by providing special equipment for sawing defective, crooked and knotty logs. In this way the main saws will make a greater cut and produce lumber of better grade and the product from the poorer logs can be handled by less skilled labor without, in any way, reducing the output of the mill.

Reasons for Utilization

There are several reasons why it is advisable to utilize this rough material. When left in the forest it not only makes an effective fire trap, which is a menace to the remainder of the property, but it also provides a breeding place for insects and fungi. The increased amount of timber secured per acre and the greater tonnage hauled per mile on the logging railroad helps to cut down the logging expense per thousand board feet. It also postpones the time when the tract will be cut over. Since utilization is becoming more intensive each year and lumber of higher value, it is self-evident that it is advisable to postpone the closing of the plant to the latest date possible.

A further use for the rough material usually left in the forest is in the manufacture of certain oils which are secured by destructive distillation. In some of the Norway pine forests of the North and the long-leaf forests of the South, it has been found profitable to distill stumps and in some cases the larger wood in the tops. The expense of bringing the raw material to the distillation plant has not yet given this scheme wide application.

Waste at the Plant

The raw material wasted around the manufacturing plant consists of sawdust, exclusive of that part utilized for fuel; edgings; slabs; and short length lumber, including trimmings from the saw mill and the planing mill.

Around most large saw mill plants the greater part of the sawdust is required for fuel in the power house, hence the loss is not great. However, in plants where circular saws are used instead of band saws, the per cent of the log that is converted into sawdust is greater than is necessary and the operator suffers a loss from this cause. In large mills there are few cases where an operator is warranted in continuing the use of circular saws, for by so doing he is not only wasting material, but likewise is reducing the output he should secure from a given number of logs. Near large centres of population, saw mills are often able to sell surplus sawdust to ice companies for packing ice, and to certain classes of merchants to cover the floors of their places of business. It is reported that it has been pressed, successfully, into sticks and used for fuel, retailing for $9 per ton. Aside from the above uses it is distilled in retorts and various products, chiefly alcohol, extracted; in a fine form it is used in the manufacture of dynamite and also linoleum. The uses for sawdust are increasing and in the near future plants favorably located will undoubtedly have no surplus product of this character to destroy in a burner.

The waste in slabs is due to several causes, among which are crooked logs and those with a large swell on one end; also heavy slabbing on the part of the sawyer. It is seldom desirable to bring a very crooked log into a mill since the loss in slabbing is usually heavy and the output for the mill crew is reduced because of the difficulty of handling crooked logs on the mill deck and the loss of timber in squaring up the stick. Where special attention is not given to sawing, sawyers frequently slab heavily in order to secure a merchantable board the full length of the log when the second cut is made. If all logs were perfect cylinders this loss would not be great. Since most logs are larger at one end than at the other—and often the difference is quite marked—the slabs on the large end of the log will usually contain material that would produce several short boards of merchantable width and length. This waste can be greatly reduced by having the pond men send all sound logs to the deck, large end first. If the management then insists on the sawyers cutting thin slabs, the maximum amount of lumber can be secured. This is especially true where long timbers are cut. A test made in a Southern pine "timber" mill showed an increase of 5 per cent in the output when this system was used. Placing the butt end of the log on the forward part of the carriage is also an aid to the sawyer, since he can see shake, rot and other defects which are of more frequent occurrence on the butt end than on the top end of the log. There are certain mechanical advantages possessed by this method which tend to increase the cut of the mill. Where the small end of the log is placed near the sawyer, the carriage must make a run the full length of the log in

* Professor of Lumbering at Yale College. Reproduced from American Forestry.

order to remove the slab, while where the large end is placed nearest the sawyer a short carriage run only is needed until the log is slabbed down so that the saw cuts for the entire length of the log. Whlie this saving of time is not so apparent in a slow speed mill it adds materially to the day's cut where the mill is run at high speed. It is seldom desirable to place the small end of the log on the forward part of the carriage unless that end, only, is defective.

Loss in Edging

The waste in edging lumber varies greatly in different mills, since it depends largely on the watchfulness and interest displayed by the manager, and on the skill of the edgeman himself. Two forms of waste are frequent in edging. One is due chiefly to carelessness on the part of the workman who fails to set his saws properly to secure the maximum width possible and who in consequence may waste clear material on one or both sides of the board. A second form of waste is due to the trade requirements which demands even-inch widths in boards. Custom has decreed that lumber shall be cut in even widths and this often entails a sacrifice of an inch of lumber on a given board. In time this waste is certain to be eliminated, and also the requirement that all lumber shall be cut in even lengths. A third and also a common form of waste is seen in many mills, especially in the yellow pine region of the South, where large quantities of quarter-sawed flooring are manufactured. Unless flooring is a specialty with the mill, and it often is not, the stock for manufacturing this kind or product, made in 3 and 4-inch widths, is secured by ripping, on the edger, quarter-sawed strips from wide boards. These boards often have clear stock on one or both edges, and are knotty in the centre or possibly on one edge. Since quarter-sawed flooring is worth several dollars more per thousand board feet than No. 1 common boards from which they are usually ripped, it is very desirable that all of them shall be saved. Unless the edger-man is well posted on grades and values he will often leave flooring strips on wide boards and the operator suffers a distinct monetary loss. Since No. 1 common stock is usually air-dried and often becomes sap stained, strips can not later be secured to advantage, because of their reduced value, due to this defect. This loss in edging can be eliminated largely by employing edger-men who are expert graders and who are well posted on values. A distinct advantage would be gained by having a man at this work with whom the manager could talk over, intelligently, the question of values.

Distillation Plants

Where the daily output of lumber is large, some operators have found it practicable to encourage the establishment of destructive distillation plants and paper mills chiefly for the utilization of slabs and other mill refuse. This practice will increase in favor with large operators, during the next few years, when the methods have proven to be beyond the experimental stage.

A common form of waste is in short lumber. It is only a few years ago that the writer saw at a large southern mill, all lumber eight feet or less in length sent to the burner. Even now many southern mills do not save any lumber less than six feet in length. Many of the short length pieces come from side boards which are the result of squaring up the log, and hence are to a very large extent free from knots and will make lumber of the higher and highest grades. Material of this character is especially suitable for novelty work and indoor finish, such as wainscotting, etc. It can be worked into an endless number of patterns cut to the length required by the consumer. There is no reason, except possibly the slight additional labor charge for handling and re-manufacture, why such material should not be used by the carpenter or novelty manufacturer rather than purchasing long lengths and cutting them into shorter ones. This fact is now evident to many buyers and keen lumber salesmen find a market for more short lumber than their mill normally produces and the price is not far below that secured for standard lengths.

Demand for "Shorts"

A further source of "shorts" is from pieces secured while slabbing logs, and also from the ends of boards cut off at the trimmer and in the planing mill. These two sources yield short pieces which are in demand by novelty works. The sizes in which this material is marketed are extremely variable, owing to the multitude of purposes for which it is used. The following are some of the smaller sizes sold by one firm.

1-in. x 1⅜-in. x 6-in.
1-in. x 1-in. x 25-in.
1-in. x 3-in. x 22-in.
1-in. x 4-in. x 21-in.
1-in. x 6-in. x 12-in.
1-in. x 6-in. x 13-in.

All of these and a multitude of other widths and lengths can be made from material picked from the conveyor carrying refuse to the burner. While the sale value of "shorts" is not great the mill owner who sells them secures a satisfactory profit from material he otherwise would be forced to burn at a cost to himself.

The manufacture of shorts is still in an experimental stage, although the demand is good and is constantly increasing. Those millmen who now handle them often prepare them with machinery which has been cast off in some other department and which is not always as well adapted to the work as it might be. Further cheap labor is often employed in the "shorts" department and because of its inefficiency the best results are not always obtained. It is believed that the introduction of special machinery for handling shorts and the employment of more skilled labor would enhance the value of the product and also increase the amount of material secured. An undesirable feature of "shorts" manufacture is that the supply of raw material for lath is greatly reduced and a sufficient supply of them can not always be secured. The manufacturer, therefore, must choose between the two products.

There are several reasons why the manufacture of short material should appeal to the up-to-date manufacturer, among which are: (1) a small profit is made from material that otherwise must be burned at an actual monetary outlay; (2) an expenditure for power is seldom required since the main power plant can usually meet the light extra demand made on it. There is also a gain in efficiency since the same labor, supply and repair cost for power is distributed over a greater output; (3) the increase in the payroll usually means an increase in business at the company store.

Short length lumber from four to six feet long has been handled most successfully by those who have marketed it as a special product rather than by trying to sell it in combination with standard lengths. Shorter lengths are always sold under special contract.

Waste in Odd Lengths

A form of waste that has attracted much attention during the last few years is that of odd lengths. It has been the custom, for years, and still remains so, for manufacturers to place their product on the market in standard lengths, ranging from ten to twenty-four feet, in multiples of two feet. This practice grew up largely among the white pine trade and, apparently, was inaugurated to simplify lumber measurement. It has several advantages from the retailer's point of view, in that fewer lengths of lumber must be carried in stock to meet consumers' demands; hence a smaller stock and less shed room is demanded. It is well known, however, that if is very seldom that builders can use lumber in even lengths, it being necessary to cut some even length back to the odd length desired. It is perfectly feasible, therefore, to use odd lengths, and it would mean a large saving of valuable material at the manufacturing plant. It has not been possible, however, for the manufacturers to convince the buyers that odd lengths can be used to advantage and this waste still goes on as it has for years past. An estimate of the Forest Service places the loss of material due to the necessity of cutting Southern yellow pine to even lengths at 1.21 per cent of the total cut, a large waste in the aggregate, when we consider that the lumber cut in 1911 was nearly 13,000,000,000 board feet. The waste in odd lengths occurs chiefly at the trimmer in the saw mill, where defects on the ends of boards could often be removed by cutting off one foot only and in the planing mill where a similar difficulty is encountered.

The Machine Sanding of Various Woods

It is a far cry back to the days when sanding was done by hand and it is not the intention to consider that phase, or any of the minor intervening phases, in this article. Here will be considered the use of sanding material used with good results in putting work through the modern single-surfacing or double-surfacing sanding machines. Less than three decades ago, cherry, walnut, and mahogany were in extremely popular demand, particularly in desk work and cabinetmaking. The ever-growing scarcity of these woods, causing an increase in price, has swung the demand to the substantial oak. Still there is, and probably always will be, more or less of a call for the former woods.

Cherry and mahogany are difficult woods to sand on a roll-feed sander. There seems to be something in the nature of these woods that shows out every scratch, dent and feed mark of the sanding machine, so in working this kind of material the operator must be sure that he has his adjustments made to a hair, so to speak. It is not fair to blame poor work to the sandpaper when in reality the fault is elsewhere.

Too fine a grit is not good for a finishing paper, because cherry and walnut cut very easily on a sanding machine, as also do most grades of mahogany, including the San Domingo, Cuba, African, and South American mahoganies, baywood and Spanish cedar. The last two woods are used exclusively in place of mahogany, having much the same grain and figure.

On the finishing drum, practical work has proven that No. 00 in a garnet will give the best results. In sanding cherry and walnut, care should be taken to always have the fine paper absolutely sharp. On most grades of mahogany it is possible to use a somewhat dull paper, although the hard San Domingo mahogany needs a sharp paper to sand it perfectly.

Garnet paper has been found superior to flint, and the best combination on a three-drum sander is 1½, 1, ½, or 1, ½, 00. On some

work garnet paper is used to advantage in the combination of 2, 1, ½, but this is a little coarse for doors or panel work, where the sanding is across the grain on style and muntins. In such cases a No. 00 paper should be used for the finish paper.

Sanding Soft Woods

Now consider some of the woods used for interior decoration. White pine, basswood, poplar, whitewood, elm, and butternut, cut very easily on the sander.

The woods are soft, and, after being kiln-dried, during sanding are apt to become "dusty." This dust will accumulate on the last out-feed roll, especially when a fine paper is used for finishing. Here is where a good brush gets in its work, not only in cleaning the stock after it has gone through the last paper roll but also in cleaning the bottom feed roll.

If the dust is allowed to accumulate, it mashes into the soft woods, and spoils the sanding. On these woods 00 garnet is good, or 0 is perhaps a better paper for finishing, particularly on straightgrain work.

When sanding hard pine, North Carolina pine, cypress, or some of the other sticky woods, we have material that tests the quality of the sandpaper, for the gum in the woods clogs the paper to a great extent. Here it is wise not to use too fine a grade of paper.

Maple and birch are hard on sandpaper, but being close-grained it is possible to give them a high polish with a comparatively coarse paper. When sanding such woods as Circassian and burl walnut, crotch mahogany, rosewood, gum, or some of the other fine cabinet woods with a very fancy figure and grain, and which is to have a fine polish, then is the time to get in good work with the fine grits of paper.

Just a word here. A fine grit is useless on a sand drum out of balance or not cutting absolutely the same from end to end and running true with a light pressure on the pressure roll. Some sanders can be so accurately adjusted and run so true that a good operator has no trouble in producing the finest work on the above-mentioned cabinet woods.

The most used of all woods is the ever-substantial, sturdy oak. Quarter-sawed oak is a hard wood to sand on a poor sander, but when put into a modern machine, with its contrivances for helping to make good work, it comes out at the rear end as smooth as velvet and fairly shining in splendor.

Characteristics of Oak

The characteristics of oak are somewhat different than most of the cabinet woods. It has a very open grain, and in quarter-sawed oak there is a hard and soft grain, as well as an open grain. The figure, or splash, which gives it character, is hard, and of course the remainder is comparatively soft. Too fine a sandpaper with a heavy pressure on the drum will eat into the soft and leave the hard, thus causing a wavy appearance.

Sometimes, in any kind of work, the paper on the machines gets clogged up with the dust before it is worn out. Frequently if a piece of hard wood is run through at a sharp angle it will clear the paper for further use.

Another trick comes in handy when the operator is crowded for time with a big pressure of work behind him, and cannot afford the time to change the sandpaper. Perhaps it is the case that the coverings have just been put on, when someone comes along with a gummy piece of work, maybe all covered with glue, and a hard spot or knot in it. The piece is run through to accommodate the workman, with the result that a streak is burned in the paper. It shows up black with the sand drum running, an annoying blemish.

If the sand has not been injured too much, the mark may be wiped out with a drop of oil from the squirt can, and the work in hand may be continued until the rush is over, or until it is necessary to change the sandpaper for the reason that it has done its duty.

As to the paper itself, it would seem that a book might be written on the different grades of papers that are put out by different manufacturers.

Differences of Numbers and Grades

One maker of sandpaper has a No. 1 that is almost as fine as a No. ½ of another, and the differences will be observed by the operator.

So it is really up to the man that is doing the work to decide what paper is best suited to the requirements of the operations he has in hand.

As to the qualities of flint and garnet papers, the latter is coming more and more into popular use, and wherever experimental tests have been made it has in almost every instance lasted longer and produced better results.

Lumber Camps Will Have Busy Winter

Representatives of several of the large lumber companies operating in the Upper Ottawa region report that operations in the bush this Fall will be unusually heavy, and that about 35,000 men will be employed about two months hence. This is expected to go a long way toward relieving unemployment in Eastern cities. The reason given for the extra lumbering operations is that a great deal of timber has been felled by storms and slightly damaged by bush fires, and that it must be utilized at once before decay sets in.

Southern Pine May Become a Pulpwood Factor

So much attention has recently been given to the increasing invasion of Canadian paper in the market of the United States that a recent address delivered by Mr. V. E. Nunez before the Louisiana Forestry Association, in which he dealt with the suitability of long-leaf pine as a raw material for paper-making, is of much interest. Mr. Nunez, who is in charge of the Research Department of Arthur D. Little, Inc., Boston, Mass., has made a very careful study of this subject. From his remarks, it appears very likely that the near future will see large pulp and paper mills erected in the long-leaf pine districts of the Southern States. "It is apparent," he said "that in order to prevent the wood pulp and paper industry of the United States from taking wings and flying over to Canada something must be done to provide new sources of raw material. There are two obvious ways of doing this. First—To make use of new woods—Second—To make more extensive use of fibrous waste and introduce new fibrous materials, aside from wood.

After discussing the necessary qualities of a fibrous material for paper making, Mr. Nunez said: "In the South, long-leaf pine is receiving a great deal of attention. This wood, which outranks all others in commercial and industrial value, is of course too valuable to be worked directly into paper, and it is only the waste of the logging and milling operations that the paper maker can hope to touch. The amount of this waste, however, is too vast to be readily conceived. The total cut of yellow pine in 1910 was 14 billion board feet. It is estimated that 60 per cent of the total wood in the tree is wasted in the woods and at the mill, so that the total waste wood amounted to 21 billion feet. This amount of wood is sufficient to make about 35,000 tons of paper a day, providing it could all be collected and used. The paper-maker, however, is forced to be somewhat nice in the selection of the wood that he uses. He cannot use red heart, punky or partially rotten wood, nor wood that is badly charred, nor wood that is excessively knotty. He cannot afford to handle very small pieces and he suffers some loss when removing the bark. We may safely assume that at least 10 per cent of the total waste is suitable and available for paper making purposes. On this basis, there is enough wood for the manufacture of 3,500 tons of paper every 24 hours. This would add about 25 per cent to the total production of paper in the United States.

"Long-leaf wood is well adapted for the manufacture of certain classes of paper. It is heavy; it possesses a strong, broad fibre averaging 4.28 millimeters in length, as compared with the fibre length of 2.8 mm. for spruce and 2.4 mm. for hemlock. The yield of pulp per unit weight compares favorably with that of other pulp wood, and the yield per unit volume is higher than most. The chief disadvantage of the wood for paper making is its high content of resinous matter, which precludes the application of the sulphite process for pulp manufacture, which in point of cheapness of operation and ease with which the product may be bleached is generally superior to the sulphate, or the soda pulp processes.

"The two latter processes may be successfully applied to the pulping of long-leaf pine, and it has been definitely proven that the sulphate process is superior for the purpose. The particular process which has been commercially adapted is the Kraft sulphate process, the product of which is a tough, long fibred, unbleachable brown pulp excellently suited for the manufacture of Kraft wrapping paper."

Death of Mr. P. J. Edwards

Percival James Edwards, of 34 Admiral Road, died recently at the home of his father, 103 St. Clair Avenue, Toronto.

Mr. Edwards who was born in Bobcaygeon 39 years ago and educated in Toronto, was until recent years engaged in the lumber business. Three years ago he took up the brokerage business and remained in it till the time of his death. He was a menber of several local clubs and was well-known as a curler. He is survived by the widow, his father, brother and four sisters.

Eberhard Faber started a successful plant for making lead pencils in 1861 at New York. A pencil slat is 7¼ by 2½ by ¼ inch. These are cut in the Southern States and shipped bundled or crated, a crate containing enough stock for 100 gross of pencils. A slat has six grooves cut in it by a machine. Lead strips are laid in the grooves and glue coated, then covered by another slat. A machine then separates the whole into rough pencils which are polished, painted, stamped and graded.

Hurd Bros., Buffalo, N.Y., recently purchased twenty-six and a half acres of land on the East Side of Bailey Avenue close to the Lackawanna Railway Company's tracks. They intend to erect a large planing mill and install an extensive yard at that point.

St. John Quarters of the Simonds Canada Saw Company

The new quarters of the Simonds Canada Saw Company, Limited, branch office and store at 53 Water Street, St. John, N.B., have been occupied long enough now to have proven the advantage of changing from the former location on Sheffield Street. The new place is in the heart of the wholesale district of St. John. In addition to the stock of

New St. John Office of Simonds Canada Saw Company, Limited.

mill saws and knives, and files, which is carried at this place there are facilities for repairing saws, a department that has proven itself a great convenience to may of the smaller mills in the provinces. Mr. John Wood is the local manager in charge of this store.

Jeffrey Manufacturing Company's New Canadian Manager

The Jeffrey Manufacturing Company, manufacturers of electric locomotives and conveying machinery, announce a change in the management of their Canadian Branch, located at No. 55 Cote Street, Montreal. Mr. M. W. Sherwood, who for a number of years was assistant sales manager at the Columbus, Ohio, factory, has been placed in charge of their Montreal office, taking the place of Mr. H. W. Scott, who has resigned to establish for himself an engineering and contracting business. In the four years in which Mr. Scott has been in charge of this office, he has made a host of friends among the lumbermen of Ontario and Quebec, and they will all wish him success in his new undertaking.

The Metagami Pulp Concession

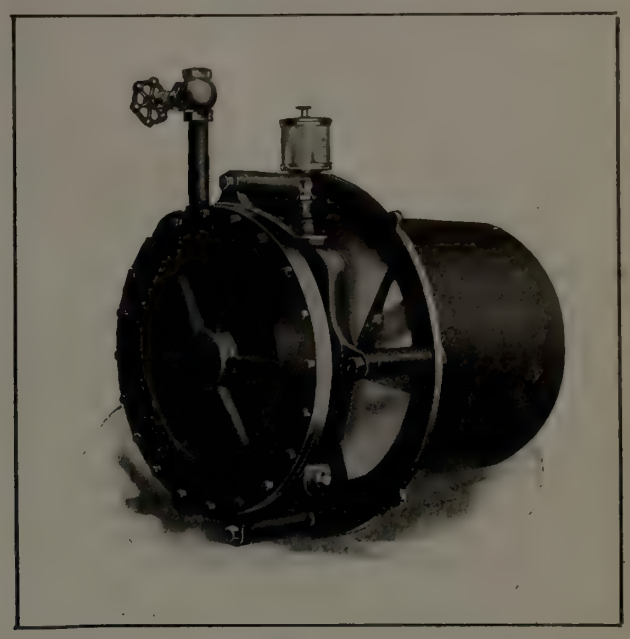
The Ontario Government has granted to tne Chisholm Corporations, Limited, of Toronto, who were the highest tenderers, a pulp concession of the Metagami Pulp Limits in New Ontario. Mr. Duncan Chisholm, of Toronto, is the principal interested party. The corporation is to put up a pulp and paper mill at Smooth Rock Falls on the Metagami River, at a cost of $1,750,000, and to operate it so that it will produce not less than 150 tons daily, equal to 100 tons of paper and 50 tons of pulp, and that 250 men shall be employed continuously. The work of building the mill is to be proceeded with immediately. During the first year $50,000 is to be spent upon the work, and during the second year $350,000. They are to pay the Government an annual rental of $1,500 for the territory. It is understood that Mr. Chisholm is now forming a company to carry this proposition. The pulp concession which he has secured includes the following twenty-one townships:—Whitesides, Carscallen, Massey, Turnbull, Cote, Robb, Jamieson, Jessop, Byers, Loveland, MacDiarmid, Moberly, Thorburn, Reid, Wilhelimina, Geary, Mahaffy, Kirkland, Laidlaw, Sydere, Bradburn.

It is officially stated that the British Canadian Lumber Corporation have closed the deal whereby the sale of the company's largest mill has been affected. The probability of an early sale is mentioned in Mr. Abraham's article published on another page of this issue. The price received is one million dollars: $50,000 cash down, $700,000 on August 1, 1914, and the balance in twelve months, bearing six per cent interest. We understand that it is the intention of the company to sell all its mills which, in the opinion of experts, will place the company in a vastly improved position.

For the year ended June 30 last the earnings of the Wayagamack Pulp and Paper Company, Three Rivers, P.Q., were $403,903 and the net profits $193,903. During the year, the plant of a capacity of 50 tons of pulp and 50 tons of paper was doubled.

The Easiest Way to Burn Shavings

A great many plants have trouble burning sawdust and shavings on account of insufficient draft in the furnace. In order to do this successfully and to get the amount of steam required a higher stack is necessary with tremendous expense. Many mills have recently adopted a small turbine driven fan which is comparatively inexpensive and



B. F. Sturtevant Company's Turbo-Undergrate Blower.

which gives sufficient draft to burn shavings mixed with coal dust or any other combination of fuel. With the additional draft it is also possible to keep up pressure quite easily and to get all the steam required. In many cases the turbo-undergrate blower has saved the cost of installing new boilers. This set consists of a small turbine with a fan mounted on the same draft. The fan is surrounded by a thimble 18 ins. long which is set in the brick work under the fire grate.

The set is manufactured by B. F. Sturtevant Company of Canada, Limited, of Galt, Ontario.

Lining Up A Circular Log Saw

McGrath, the filer, glanced up from his filing and looked me over. I was the new sawyer, come that morning to handle the lever in a small eastern mill cutting 25,000 to 30,000 ft. spruce bill stuff, with a two-saw power edger as a helper, which took all small and top logs after sawing through and through 2-in. or 4-in. with the board saw; edgings from this edger went into laths.

I had about thirty minutes before power went on. First I tried the lead of the saw. I worked the carriage so the second headblock was opposite saw at base of teeth near the spread wheel. Then I took two broken laths, about 20 ins. or so long, and with my knife brought one end of one to almost a point. This one I laid on headblock so point was near the saw, then tacked with nails the other piece, one end about 6 ins. from pointed end of other piece, the other end tacked to lower side piece of the carriage, just over the trucks or rail. Then with setworks worked beam up until the point of stick was about 1-16-in. from saw. I was sure my guide was open so as to not touch the saw, also this was done in the morning when there was no warmth in saw or mandrel. I took a shaving to see how much space that 1-16 was, as it is deceiving to the eye. I then ran the carriage back until opposite base of teeth near the guides, tried my shaving, and adjusted the mandrel so I could tell I had just a little lead. If possible, I like to turn saw half way around and try again. I then saw that the setworks came out on the 1-in. where they should, measuring how far from point of teeth uprights on carriage are when on 1-in. Then I knew where my saw was, providing track was straight.

After starting up, by watching my saw I could tell if it was doing good work and if saw was fitted as it should be. A sawyer has to be a close observer. I was told not to make any side boards—that is, side planks—even if I could only get a 4-in. face, as all slabs and edgings were wanted for laths.

McGrath, the filer, was a good mill man and filer. He could get the right tension and keep the saws up, and with swage bar and hammer make a pretty tooth, using a Covel emery wheel sharpener. But he was a mill man with a grouch. That is, a man of very few words, and those usually complaining of the supplies and the machinery in general; disagreeable to those he came in contact with at the mill. Why is it we find so many of this class amongst our best mill men? Is the constant watching and close observing wearing on the nerves, or is it one's disposition to gradually drop into this complaining? It seems we are all queer to the other fellow.

Building Up Retail Trade

For many years the country yards have been carrying a number of side lines in addition to their regular stocks of lumber, and with most of them there has been more or less added to these side lines from year to year until it has got so that the space in the average yard is all taken up with them. The stock of lumber may run down in quantity, but there is room enough on the old piles to afford space for what is brought in of new stock. There are many things, however, in a yard's stock that there is no room for where they can be seen, and so they are tucked away overhead or back in some corner, with the chances of their being forgotten even when there is an opportunity to sell them. There are other items also, that though they are where they may be seen, yet they are not seen in a way that will attract attention. Some of these, too, are not seasonable at all times in the year, and not one customer in ten knows they are in the yard, unless he happens to inquire if the dealer has them. So it may be said of the average yard that a good many of its items of stock are practically unknown and buried to the public eye.

A few days ago I noticed a dozen or more men gathered in front of the show window of a hardware store. I stopped and made one of the "rubber necks." In that large window was displayed an elaborate arrangement of things in hardware such as I never had seen before. I couldn't begin to describe it, but among these articles I saw a miniature size of monkey wrench about four inches long, perfectly made and of the very best material. It looked so cute and attractive that I at once wanted it, so I went in and bought one like it. The store was full of customers, attracted no doubt as I had been, and it was some fifteen minutes before I could get waited on. Now, I had no more idea that I was going to come home with such a thing as a monkey wrench in my pocket than I had of buying a flying machine, and I wouldn't have parted with the 35 cents I paid for it, had it been tucked away on a shelf in the store. I never would have known there was such a store in the city if that show window had not stopped me and pulled me inside.

Another instance: I saw in the show window of one of our department stores a lot of miscellaneous articles, and a sign telling that, "These are for sale in our basement." I went in and talked with the manager of the basement department, and he said that very few people would ever know they kept such things if they were not informed of it through something that would attract their attention.

With these ideas gathered in this way, I got to thinking of how many things there are in a lumber yard stock that but few people aside from the yard men knew anything of their being there. Yet they were got for the purpose of selling. This is a fact, and you'll admit it, now that I have drawn your attention to it, but will it change you in your methods of doing business in this respect? I remember an instance in my own experience that taught me a lesson that I ought to have taken advantage of more than I did, but we didn't see things in selling goods as we see them today.

Gave Me an Idea

An old farmer was in the yard getting some stuff. I was using a short ladder that I had, to climb up on the higher piles, and looking at and examining it, he said, "Gosh, I wish I had one like that, but longer." I felt sort of foolish at hearing him say that, for I had a good stock of ladders on hand, and being crowded for room I had piled them away up next to the roof in the shed, and half the time I forgot that I had them myself. On this occasion I didn't waste any time in climbing up there in that sweltering atmosphere and dust and shoving half a dozen down where he could see them. He was really surprised that I had them in stock. I sold him three of different lengths. This was in August and stacking time. The sale of those three ladders sold me a dozen more within a week, and by the time the season was over I was pretty well cleaned out of my ladder stock.

Half the people that come to the yard don't know what they want until they see it. Many a time I've had men cone into the office and say, "I've been looking all through your yard for what I want, but I can't find it." As soon as they had named the articles, the chances were that I knew I had it and could tell where it was. Probably it was in plain sight to me, but they couldn't see it. There are some things, of course, in lumber that only the ends can be seen from the alley way, but there are others such as eave-troughs ladders, molding and numberless other articles that are in stock, but hid away where the customer don't see them. Take the one article of eave-trough for instance. Practically every dealer carries it in stock, but I venture to say, very few ever nake a special effort to sell it, even in a wet spell of weather. People naturally associate eave-trough with the hardware store, and it never occurs to them that a better article can be found at the lumber yard. Yet it is a fact that a wood eave-trough properly put up will out last for several years the common tin eave-trough that is usually sold at the hardware store, and besides, is much cheaper. Comparatively little of the wood eave-trough is used on dwelling houses for the reason that the dealer don't make an effort to sell it for this purpose. Generally he handles only the trough itself and don't bother about keeping all the fittings that go with and are needed for the proper eave-troughing of a house. The carpenter should be instructed how the job should be done, and then when you sell a bill, make the effort to eave-trough the whole building. A good idea would be to put it on all your yard buildings, and in this show it up to the best advantage. An eave-trough on the alley side of your shed would carry off the water that now pours from the roof down in the alley way to help keep it in a muddy condition. Let me say this too, whenever you sell eavetrough, or use it yourself, be sure to advise and have it painted. This will prevent it checking or beconing warped. Every time a tinner puts an eave-trough on a building he sees that a coat of paint goes on it before it rains. And if he does it with metal, why should not the lumber dealer do the same with the wooden trough that he sells? I have often thought that the difference with which wood and metal is treated in this respect is a tacit acknowledgement of the superior lasting qualities of wood when exposed without the protection of paint.

A Building for the Purpose

When I consider how much of a yard stock is where people can't see it, the thought naturally suggests that there should be a special building in a yard where this part of the stock could be displayed. I think the retail business has got so now that such a show room is needed in every retail yard of a size proportionate to the character of the mixed stock that is carried. A one-storey building about 16 x 24 would be large enough for the average yard, and should be near to and connected with the office. But whether on a main street or off to one side in the town, it should by all means have a good sized show window. I think this idea with me was stimulated when I was visiting the Forest Products Exposition at Chicago. Every concern exhibiting there had a space wherein was shown a sample of every wood they manufactured. In this respect, I think the West Coast Lumber Manufacturers' Association out-did them all, for they had a full size d sample of every grade they made. A visitor could look at a full length board or piece of dimension of the different grades and see exactly the difference in their various qualities. As one of the results of this honest and splendid showing, I've understood since that orders to the amount of six million feet of the products of this association were taken during the time they were there.

There is no use though, in having a room like this unless it is used for the purpose designed. The dealer himself must become imbued with the idea of showing his goods for the definite purpose of creating a desire for them, and thus increasing the demand. He must keep it clean and change the arrangement of the articles often enough to attract the attention of the public. By the exercise of ingenuity and enterprise, he can make his show room one of the show places of the town. There should be a sample there of everything he has in the yard, and anything else he can pick up that is novel and will excite attention. It would be a place, too, that he could invite the older pupils of the school to visit. Let then come, one class at a time. I believe any school superintendent would cheerfully fall in with this idea and be willing to co-operate with the lumbermen in carrying it out. Just fancy yourself giving a little lecture talk in this room before a dozen or so of boys and girls, showing them the different woods and other articles and telling the class where they came from; how they were made, and what they were used for. Why, I am certain you would not only interest the children, but you would get mighty interested yourself in what you were doing. You would be really the largest gainer because it is a fact that we gain more in knowledge as we give it out. Then again think what it would mean to you and your business to have one or two hundred children get interested in the things in your yard, everyone of them would be asking their parents for further explanations of some things you had said to them in your talks. When you stir up the children and get them interested, you are creating a commotion in the whole community, and at the same time you are getting out of the old rut of doing things yourself.

The Law of Service

You may smile and think this is rather small business for a lumberman—one of the principal men in the community, to bother his head about. But let me tell you, my friend, there are as big men as you who don't consider that it lowers their dignity to attend to such little things as these. The greatest man in any community is its greatest servant. The greatest man that ever lived told his followers, "He that would be the greatest among you, let him become your servant." The law of service is the law of greatness, and if you look around you and out in the world, study its meaning and see its manifestations, you will realize one of the greatest truths that governs human relations. In one of our largest banks here—and it is a big one—you will see the president of the institution out in the lobby greeting the customers, directing them where to go, and assisting in many ways to make it pleasant for them. They have hundreds of women depositors, and some days the lobby is half full of them. Many bring one or two of their children with them, and it is a common thing to see the president take the little tots in his office and entertain them while their mothers are waiting their turns at the desk windows. It

is not surprising then that they have over two thousand children depositors in the savings bank department.

I am telling you all this because it is the usual thing to suppose that the president of a big bank like this is always away back somewhere in a private office, and generally unapproachable person. You as a lumberman can do no better thing to supplement your local paper advertising space than to become acquainted with the children of the town and get them to talk about you as being a "nice man." Some other time I will tell you of my experience here with a yard in the neighborhood of a lot of wild boys belonging to both rich and poor families. I enjoyed it, for it proved to be a mutual benefit to both myself and the "kids."

We often have a day in the yard trade that may aptly be termed "The day of small things," little items of sale that keep us busy, but don't foot up in the hundreds in the total for the day. A summer day's trade of this kind is hard work, for very often the yard hours extend from very early in the morning to a late time in the night. But, in accommodating this trade cheerfully with good service, the dealer is sowing the seed for much of his fall's business. Farmers don't come to town these days unless they have to. It is a busy time with them and often they are hurried and worried to get back home as soon as they can. I don't approve of a dealer's staying in the office himself and letting the yard men wait on the hurrying customers, some of whom may want things done for them that the good man is not inclined to allow on his own authority.

Must Be Handled Carefully

A customer will sometimes want something for a particular purpose and he wants to do the selecting himself. This engenders dispute and ill feeling and it requires tact and diplomacy to avoid this and to send the customer away satisfied. Many a good bill has been lost to a yard because of a dispute at such times over a little thing of a difference that amounted to but a few cents. A farmer perhaps wants a few pieces of dimension, or a few boards for some purpose that requires them to be strong, such as a hay rack, for instance. To make him take it off the pile as it comes don't suit him, and it would not suit you either, if you were in his place. For many years it was my policy to ask a customer what he wanted to use the stuff for, and then select for him the best for the purpose, and charge for it accordingly. I will tell you this, though, I did most of the selecting when I was getting in new stock. I selected the best pieces of 2 x 4, 2 x 6, 2 x 8 and 2 x 10 and put them under the shed and called the grade "Select Common." Now, whether you know it or not, a farmer generally considers that in an open yard, the stuff that is under the shed is better and more valuable than the stock that is lying outside. I noticed this peculiarity on their part very early in the game of dealing with farmers. I sold this stuff at so much a piece, instead of quoting it by the thousand feet. At the price of $10 a thousand extra on common stuff it would be apt to scare them, but the extra on a few pieces they wouldn't mind in consideration of its being better and stronger for what they wanted.

People sometimes want things which seem unreasonable to the dealer—especially to the yard men, as for instance, the cutting of a piece off another of a length to suit them. When I was green in the business, I refused to do this, and judging by this, I've no doubt but there are some young dealers now who feel as I did then—that it was an imposition to ask it. I soon learned, however, that a man in business had got to do some accommodating that went against the grain of his feelings, and being of an adaptable nature, I soon became adjusted to dealing with "cranky" notions and unreasonable demands. Moreover, I found that it paid to do so, and was a part or the business, and therefore, I got so that I would cut a piece off of anything I had in the yard. But mind you, I reesrved the right to set my own price on what I cut off, and always told the customer before hand what the short piece cost him. Wide finish that was used for certain purposes and had to be of just such a length for them, I exempted from this policy but, speaking in a general way, I usually gave a customer what he wanted if I had it. But it takes the "boss" of the yard to determine what to do in cases of this kind.

There are more or less cases in a town where people want short pieces of lunber for many purposes, and they don't want to buy a whole length at the yard for what little they want. It used to be that such little things in lumber could be got at the carpenter shop, but nowadays, carpenters don't have much lumber of their own in their shops. So, if a woman wants a piece for an ironing board or a shelf, she sends the old man to the lumber yard for it.

As a general thing people look upon a lumber yard as a place where they keep lumber of certain lengths and sizes for building uses only, and that if they wanted anything smaller they would have to buy more than was needed. I think it would be a good idea for a dealer to advertise that he would furnish lumber for any purpose required, from a clothes line prop to the largest sized bill, and specify a number of little things that are often needed. I don't know but what it would be a good plan, too, to have a lot of short stuff and a bin in the shed fitted up to pile it in an orderly manner. Short stuff that lies scattered around the yard, or thrown into a junk pile, is considered by other people as sort of waste, and not anything to be sold. But if it is kept in some one place and neatly piled, they will think it worth something, or the lumberman wouldn't go to the pains to take care of it. If a farmer sees a four or five foot piece of twelve-inch board lying round at the side of the alley he is likely to ask you to give it to him for a seat board, but if it was in its place in the bin spoken of, he wouldn't think of such a thing. There is more profit in "shorts" than anything else a dealer handles, but he has got to take an interest in creating a demand for them for purposes, aside from how they can be used by the carpenters in a building. You know as well as I do, that many people in the country places prefer to do their own carpenter work on their small repair jobs. I have even had such folks ask me to cut up their lumber for them, because of their having a poor saw. People try to do a good deal with nothing but a saw and a hatchet. Speaking of this, puts me in mind of a circumstance that may interest and give you a hint besides.

Just What He Wanted

I always had a couple of carpenters' saw horses in the yard, and one day after I had used them to cut up some stuff for a farner, he said, "I'd like to have a saw bench like that on my place." "All right," I said. "I'll sell that or both of them if you want them," I named a price and he took them. I took the print and went to work and made up a dozen, using all the "shorts" I had around the place, and they were sold, and a lot more during that summer and fall. I had no idea of having such a run on a little thing like that. Then I turned to and made a few wider benches to set on the back porches in the town, but the farmers' wives saw them, and wanted them to set their milk pans on. I remember one woman took three of them, saying there was nothing outside but the ground to put anything on, and they were just the thing she wanted. I'll tell you another thing that will capture the desire of country housekeepers, and most of them, you know, have their family washing done at home. Go around town and see what sort of makeshifts they have to stretch their lines on. Mostly a piece of 2 x 4 stuck in the ground and propped up at that. Supposing, now, you get in some six-inch ten-foot cedar posts, with about seven feet of it turned smooth in a lathe with an ornamental top on it. Bore a hole at the top. Put a hardwood pin in it to fasten the clothes line on. Paint the whole white and make a special ad. about them in the paper. Take it from me, my friend, when a woman sees a set of them in her neighbor's back yard you know she is going to manage the finances some way to have them. Along with them sell a couple of clothes props, made of an 8-foot 2 x 2 and a notch cut in at the top.

There are many sections of the country where wooden water tanks are still being used by the farmers, and will continue to be used until they can afford to make them of concrete. Making these tanks and having them for sale in the yard is another thing the lumberman can do to his profit. He can make them of different sizes and quality of material so as to meet the buying capacity of those who have, and those who haven't much to buy with. I saw this being done in a yard once and, in talking with the dealer about it, he said that the ones made of the cheaper material sold more rapidly than those made of the higher priced tank lumber. Good No. 1 common, when cut up and well painted, looks just as good as the best, and the lower price will sell them in preference. My idea in making these tanks and having them for sale at the yards is this: If you talk to some farmers about buying tank stuff, they are apt to put it off till some other time, and the chances are they will keep on putting it off. Some day they will come to town with no thought of it in their heads, but when they see one ready made, all their desires and need for one will crowd up in their minds and compel then to ask, "What do you want for that tank?" and the probability is it is loaded on his wagon before he leaves town.

Buying of this kind is done in town every day. Farm folks will drive to town with the idea only of getting a few things at the store they are out of, and drive home with other things in addition, which they wouldn't have purchased if they hadn't seen them. And there is no good reason why a lumber yard should not profit also from this sort of thing. Another thing about the making of these tanks by the lumber dealer is: He can get the work done by the slow pay carpenters who owe him and are likely to continue to owe him unless he can get them to work it out for him in this, or some other way.

The dealer whom I have mentioned, told me that he got most of his work on his tanks done in this way, and in order that they would not "soldier" on the job, he allowed a certain price for each sized tank, and they could work as fast or as slow as they pleased. There is no need for idle time in any lumber yard if the dealer has the wit and enterprise to see and use his opportunities.—C. H. Ketridge, in the Mississippi Valley Lumberman.

Recent reports from Vancouver, state that the Offshore lumber trade is increasing. The Vancouver Lumber Company has contracted to ship a cargo to Capetown, South Africa. A shipment of 1,250,000 feet was also recently taken on by the American Barquentine Kokohead. The same company will also send a cargo to Australia early in the new year.

How to Sell Lumber

Were I a doctor of selling and asked to prescribe for a patient suffering with superfluous granulation of sawmill products, the remedy would call for the following ingredients:

Well substantiated faith in the value of your products.
Understanding of the purposes for which they are best adapted.
Careful study of all sources of outlet.
Absolute disregard of competitive materials.
Systematic advertising to possible customers.
A sales force surcharged with the idea "our" stock is worth the price.

"War of the Substitutes"

If substitutes be warring on forest products and encroaching on the field formerly occupied by lumber it must be an individual warfare for private gain. As the case appears to me, it is simply a struggle for private advantage, the raiders aiding each other when to give aid does not interfere with their individual plans. Some of the private interests behind this aggressive movement are very large and very powerful, and their power is being felt throughout the land. They understand all the elements of salesmanship and constantly are adding to their store of knowledge; for salesmanship, you know, is a progressive study. They believe absolutely in the value of their product. They are impressing their belief on others.

In the face of the avalanche of claims and counter claims that have been made the lumberman shrinks back disheartened, convinced that all the good things that could be said about any kind of material have been said in favor of the substitutes.

Seemingly, lumbermen believe that the alleged "fireproof" structures made of steel and concrete are the best that can be secured. Scores of "fireproof" sawmills and planing mills have been put up by lumbermen, because they, the lumbermen, have been told of the advantages of building such plants. A number of them have been totally destroyed by fire and have been replaced with wooden structures, but the lumber industry has not made capital of that fact because it has not realized and seemingly does not realize that the repeated failure of the alleged fireproof buildings is a telling argument for the use, under proper conditions, of common sense mill construction buildings.

Intelligence Wars on Ignorance

This seeming "War of the Substitutes" in reality is the toll intelligence demands of ignorance. Manufacturers of substitute materials were forced to create a market for their products. That necessity made a painstaking study of the uses and values of such materials imperative. The manufacturers found, perhaps invented would be a better term, uses for their materials and developed a wonderful confidence in them.

It should be known to every lumberman that manufacturers of cement, for example, never tried to sell one barrel, 25 barrels or 100 barrels of cement. The idea was to sell the customer a feeding floor, "imperishable" mangers, barn boors that were rat proof and water proof, "indestructible" sidewalks which never wear out, artificial stone for all manner of purposes and subsequently siding for the home that does not require painting. That idea was worked out logically and systematically. Today there probably is more outside wall area being covered with their plaster than with our siding. That one argument: That a plastered building need not be painted, has caused the lumbermen to lose the sale of millions of feet of siding.

Enthusiasm vs. Indifference

Unless there be objection to grade or count, the lumber manufacturer loses interest in his product the moment it leaves his hands. He has produced the lumber, some one has bought what he produced and the transaction is closed. His work, as he sees it, is to make more lumber, to work night and day at his task of production. It shall be through no fault of his if there is not enough lumber to supply the demand, and he hopes against knowledge born of experience that there will not be quite enough lumber to go around so that he may get a fair price for what he makes.

Intelligence Gets the Best of It

The world is ruled by the intelligent few. That may not be a democratic doctrine, but it is the "state of affairs." When Farmer Worthy comes to town to buy material for a barn, a silo, a garage, or an implement shed he is not wholly convinced that he wants a substitute for wood. He asks the dealer, who is rather non-committal,—"I can furnish you lumber, cement, brick or hollow tile, anything you may want, and it's all good stuff."

"I know all about the cement, brick and tile, for you furnished me literature about 'em, and I heard the lecture the feller gave at the town hall."

Now the point of it all is that the manufacturer of the substitute material is continually endeavoring to interest the consumer in his products, and is succeeding. The user is being taught what the material is good for, how to use it to secure the best results and particularly why the substitute should be used in place of lumber.

If the average builder were left to his own devices he would have continued to use lumber, but many and varied interests were concerned in his use of other materials, so he was not left to his own devices. The consumer has been educated and is continually being instructed regarding the values of substitute materials.

The consumer is not being educated respecting the uses and values of lumber, save to a very limited degree, and he does not invest in lumber because he is not told day after day, week after week, month after month and year after year that such investments are profitable; nor is he being taught how to make his investment in lumber —for he continues to use lumber for certain purposes—a source of profit to himself. He believes he is paying the dealer a big profit, that the manufacturer is deriving a tremendous profit, but he does not see wherein he is profiting.

In any kind of work that which is guided by the greatest intelligence is that which makes the best showing.

Leadership Needed

Where are the leaders in lumber salesmanship? You can pick out a few that are working along the proper lines. You can get almost any number of sales managers who will prepare able papers on the "Selling Question," but you will find very few lumber organizations that are developing a sales policy or a sales department or endeavoring to do so.

The chief difference between manufacturers of lumber and manufacturers of other products is this:

Producers of substitutes sell to the dealer and for the dealer, producers of lumber sell to the dealer.

The expense and labor incident to interesting the public in lumber and convincing the public that money invested in things made of lumber is well invested is too great for the retail lumberman to assume in its entirety. Manufacturers of the other kinds of materials he handles are doing that work for him and if the lumberman does not care to assune the burden, the dealer is content with the business that comes to him and with the profit he makes from the sale of materials that are in request.

Making It Pay

Any lumberman producing 100,000,000 feet or more of lumber can afford to maintain an alert sales force. One of the chief duties of that force should be to create new and profitable uses of the company's products. In the case of a company producing 100,000,000 feet of lumber the expense probably would be 25c per 1,000 or more. Where the production is greater the expense need not be quite so great.

No general plan can be followed. Each producer should study his own product and study, also, the particular field in which that product should be used more extensively than it now is used.

An Individual Problem

Selling lumber intelligently is an individual problem. In some cases manufacturers are so grouped that they may combine their efforts and reduce the cost of the work. But in no sense is the sales question one of the big problems to be handled for the benefit of the entire industry.

Now to make that situation more easily understood, the big lumbermen of the country cannot drop a contribution into the box and wake up next month or next year to be confronted by a demand for lumber that cannot be supplied. Attenpts to handle the problem in the manner indicated are about on a par with attempts to make men honest by proclamation.

When the time arrives that the builder can be shown that to buy lumber and use it intelligently means to make an investnent from which he will reap convenience, profit and satisfaction, it will be easy to sell lumber, but until that time arrives it will be increasingly more difficult to sell lumber.—Lumber World Review.

The Fixed Knife; English Planer Practice

If one were to make comparisons between American and British methods of machine work, the points which would be most noticeable would be the predominance of band resaws on the American side and the gang and circular saws on the British side. This in the matter of sawing, or, to be more exact, in the matter of resawing. The common machine on the British side is the horizontal frame saw; which makes one cut at a time, and does that well.

It is rather remarkable that of late years there has been a decided attempt on the part of British manufacturers of woodworking machinery to push the band resaw for all it is worth. A considerable number of advertisements of band resaws have appeared in the various trade papers, and from a casual glance at the work turned out by the mills, a number of sawmill owners have invested in band resaws, More especially does this seem to be the case among the packing case and boxmakers. The results, to my mind, are not at all satisfactory; the wood sawn by the band resaws does not compare at all favorably with that sawn by the ground-off and swage saws. It shows bad ridges, and there is not that cleanliness of cut about them that makes a box made of wood, cut with a ground-off, look so well finished.

From this it will be seen that in America you have been making way for use with regard to the use of band resaws, but what are you doing with planers? Here, I think, you have been following our lead.

We have always done good work with planers, having made it a special study. Our progress in planing has been along the lines of the fixed knife, whereas yours has been with the rotary cutter. I do not mean to say that all our machines for planing are fitted with knives that will plane on all four sides, though there are one or two sawmill engineers who do make such machines. These are huge machines with rotary cutters to reduce the wood to a uniform size, then fixed knives to take a shaving from every side.

The majority of English machines are only fitted with fixed knives for planing on the bottom; these are essentially planing machines and are used for making floor boards and matching. I notice from the advertisements in The Wood-Worker that very few machines with fixed knives are used for planing, and, from the general trend of the articles upon planing, that few hints on working fixed knives are given. The whole range of articles is upon the difficulties met with in the four-headed nolder. This is well; there are sufficient problems attached to running a molding machine that every point of view is helpful, and even the oldest of us can at times learn something useful.

The use of the fixed knife will become more common as the advantages are better known. Even as we are taking up with the band resaw, so the planer with the fixed knife will be taken up by those firms which want to turn out the best work. The fixed knife on planers is no new idea. I can remember my father saying that his first job at a mill was taking the long shavings from a planer to the boiler house. That would be some sixty years ago, so it is not as though the fixed knife is a tool that wants a lot of proving, to be just the thing, before it is adopted. If years of experience tells, then it has stood the test. The reason it is not so universally used may be because a good deal of work can be badly spoiled if the fixed knives are not set properly.

I have noticed that even some good machinists, who can make and set up an ordinary molding machine, get poor results from fixed knives, so poor that whenever it is possible they do not use them, but trust to the rotary cutters to get a finished surface. We all know that with the rotary head, the slower the feed the smoother the finished wood, the slighter the saving and the least possibility of tearing up the cross-grain. With a rotary head, unless the cut is made very rapidly, the cross-grain is dealt with fairly well; the cutters do not tear it up to any great extent.

Not so with the fixed knife. It does not matter whether the feed is fast or slow, if the knife is not set correctly, out comes the cross-grain, and the surface of the wood has a number of pits which disfigure it greatly. It is this, more than anything else, which has done so much to discredit the fixed knife. On the other hand, it is possible to plane wood equal to that which has been through a scraping machine; to have the cross-grain so closely closed that it can scarcely be seen. Not only this, but it does not matter how fast the wood has been fed to the fixed knife, the result is the same; indeed, it is better when fed faster than when it is fed slowly.

I once got a machinist out of a bad fix. He was planing oak flooring, 5 x 1¼-in., and the surface had to be finished with the fixed knife. He had a rotary head before the fixed knives, and was taking off two shavings which were of equal thickness and which hung limp from each knife. I looked at the finished boards and the cross-grain was out—torn out in chunks. The noise that would have been made over that flooring, if all of it had gone through like that, would have been alarming; the machinist was looking worried.

"I think I'll only work the bottom cutter, not the knives," he said. "Look at those boards. My word! but there will be something said if they all come out like that."

"Yes, and there will be something said if you finish them with the rotary cutter. The head is marking them, and as the flooring will be polished, every mark will look worse when polished than it does now. Why not take a fine shaving off the last cut and set the back iron so it will close the grain?"

"What has the back iron to do with it?" he asked. "I thought all it was for was to keep the shavings free from the bolts."

"Not at all; the back iron is the master of the situation. Upon it depends whether you turn out good work or bad. Shall I put things right for you?"

"Yes, I wish you would. I will get discharged for this job if I don't alter."

He was a nice young man, so I set to work to put things right. I had the first knife box out and looked at the knife. It was out of proportion to the bed of the machine. I took out the knife and looked at the back iron; it was down over ⅛-in.

"If I have the back iron closer it will clog," he said. "That is why I will not alter it."

I took out the back iron and laid it on the knife. As I thought, it only touched in three places—three points, to be exact—so it did not matter how tightly you screwed up the back iron, the space between the back iron and knife still remained. When the back iron was set close and a thin shaving taken off the wood, the shaving broke and part of it went into the spaces between the knife and the back iron. This was soon put right and the three points levelled down until the whole edge of the back iron touched the knife. To further protect the back iron from becoming clogged by the shavings, I rubbed it up on an oil stone until a burr formed on it. This made the back iron absolutely shaving proof.

Then I examined the knife with regard to the bed of machine, or rather to the bed of the plane box. It was high in the center, so much so that the shaving was thicker here than it was at the edges—in fact, twice as thick. I put a straight-edge on the knife box and found it comparatively straight, so to have a uniform shaving meant that the knife had to be rubbed down in the center. To work off a high part in the center of the knife it is well to work the knife crosswise on the stone, a movement from side to side, not from and to you.

I got the knife straight, then set the back iron. It was not parallel with the knife; there was a difference of 1/16-in. at the ends. This certainly would not do for good work; the edge of the back iron resting on the knife should be exactly like the edge of the knife when the back iron was set; the space between the two edges would be uniform. I sharpened the knife and set the back iron so it was not more than 1/20-in. below the edge of the knife, and set the knife so it projected that amount above the knife box. This meant that it would take out a shaving that thickness, and the back iron would support the under wood while the shaving was being taken off.

The second knife was attended to and various little faults also corrected. These were very similar to those in the front box. The back iron wanted truing up so it laid flat on the knife and the knife wanted grinding and truing up to the box. I set this knife so it took off a very thin shaving and set the back iron so it was just the merest trifle less than the thickness of the shaving, for this reason: The surface of the board, when the shaving is taken off with the back iron very close to edge of knife, presents almost an unbroken appearance; the cross-grain is cut so closely that it lies almost as flat as the straight grain. When the two knives were set, it meant that the first shaving brought the face of the board to a level and the second knife gave a finished surface that was equal to the best hand work.

It is rather remarkable that the shaving will show the position of the back iron; when it is low down the shaving is quite limp, hangs without any distortion. But put the back iron up, so that it will do its work, and the shaving takes on a different appearance. If the back iron is closer at the center than the edge, the edges of the shaving will almost meet; if the back iron is at correct distance, the shaving will have loops in it like a curtain that has been draped.

If those "doubting Thomases" who believe that a back iron is of little importance in closing up the cross-grain, will try the experiment of working with the back iron down, also with it quite close to the edge of the knife, they will soon see that what I say is correct.—W. J. B., in the Wood-Worker, Indianapolis.

Efficiency for Small Circular Mills

Having been connected with several small mills over the hardwood section of the country in various capacities, such as filer, sawyer, inspector, etc., I have noticed numerous cases of negligence and overlooking of small details which cost the proprietor considerable money, says O. E. M. in the Woodworker, of Indianapolis.

The owner of a small plant bought a new mill, and with it he ordered a heavy, thick, inserted-tooth saw, some one having informed him that this was the best saw to use. No doubt it is the best for some mills in certain kinds of timber, but in this case he did not need it. I advised him to buy a pair of thin, solid-tooth circular saws, telling him I thought he would save money by it. He claimed the inserted-tooth was the best, so the argument was dropped at that time.

Later on this man told me that within a short time he had to meet a note amounting to $350, and, his means being small, he could not raise that amount of cash immediately. I concluded the time was ripe to convince him of his bad judgment in the matter of selecting saws, and explained it to him as follows:

He was cutting oak, poplar and cherry timber. His contract called for 400,000 feet, the principal part consisting of nice yellow poplar. There was exactly ⅛-in. difference in the kerf between the solid-tooth and inserted-tooth saw. This loss equaled 1,000 ft. to every 16,000 ft. cut, and one-sixteenth of 400,000 feet (amount of contract) equalled 25,000 feet. The majority of this being poplar, it would easily average $17.50 per thousand, and multiplying this by 25,000 feet equals $437.50.

When I placed these figures before him he was astounded, and declared that at his next location he would have thin, solid-tooth saws. If he had used two solid-tooth saws he could have changed saws instead of filing on the mandrel, as he did, thereby losing time.

I am not, however, arguing altogether against the inserted-tooth saw, for in my opinion it is the best for some kinds of timber, especially hickory, also where there is trouble with heavy sand or gravel. But in the majority of small mills not cutting hickory, pecan, etc., and not bothered with sand or gravel, the thin circular will do perfect work with less kerf than the inserted-tooth, providing track is level, manurel hung properly and saws hammered and dressed in good condition. In fact, the main thing is to have a man who has had plenty of experience with thin saws.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 7-tf

WANTED—3 x 3 x 18 in. dry Rock Maple squares. The B. H. Piper Co., 335-349 Somerville Street, Manchester, N.H., U.S.A. 15-16

Stumpage Wanted

Wanted to buy white pine stumpage in Algoma District. Address Box 53, Canada Lumberman, Toronto, Ont. 14-14

Wanted

One or two blocks of Spruce, also Pine, must be well manufactured. Apply Box 31, Canada Lumberman, Toronto. 11-t.f.

Wanted

One or more cargoes of 1 and 2 in. Spruce for delivery at a Lake Erie Port.

E. C. BRADLEY LUMBER CO.,
14-17 Cincinnati, Ohio, U.S.A.

Wanted To Buy

Two million No. 1, 2 and 3 Pine Lath and one million Hemlock Lath.

M. BRENNEN & SONS,
12-15 Hamilton, Ont.

Wanted

1,000,000 ft. Spruce, 1-in., 1¼-in. and 2-in. If not already cut will give sawing instructions. Apply Box 30, Canada Lumberman, Toronto. 11-t.f.

Lumber Wanted

Soft Elm, 4/4 Log Run.
Basswood, 4/4 full product.
Ash, 4/4, Log Run.

Quote rock bottom prices for cash F.O.B. Mill for dry or new cut. Box 63, Canada Lumberman, Toronto. 15

Wanted

Soft Elm, 4/4 log run.
Birch, 5/4 log run.

Quote lowest prices F.O.B. mill for dry or new cut.

E. M. NICHOLSON,
Board of Trade Building,
9-t.f. Montreal, Que.

Wanted To Buy—1000 Birch Logs

fresh, clean, straight and sound, 14-in. and up diameter at small end, 8 ft. to 16 ft. long. Delivery to commence as soon as possible. Terms: 75 per cent. cash when alongside track at railway station, balance when loaded on cars. Write P. O. Box No. 1595, Montreal, stating best price. t.f.

To Manufacturing Lumbermen

Wanted—Clear Birch, kiln dry preferred, cut to following measures: can take about 22,000 pieces per year in two deliveries, viz.: 8,000 cut 21 in. x 5 in. x 3 in. and 3,000 cut 28 in. x 5 in. x 3½ in. Quote prices C.I.F. London, Eng. Address Geo. Care Ltd., Victoria St., Norwich, Eng. 15-17

For Sale-Lumber

FOR SALE—Three or four carloads of XXXX Cedar Shingles. Also 15,000 small Cedar Ties, good for construction, siding or radial purposes. Quick shipment. Will make the price right.

The John Carew Lumber Co., Ltd.,
15-16 Lindsay, Ont.

Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.

GEO. C. GOODFELLOW,
c Montreal, Que.

Hard Maple Lumber For Sale

One car 4-in. firsts and seconds, $37.00.
One car 3-in. firsts and seconds, $32.00.
12 M. feet 2-in. firsts and seconds, $32.00.
Down Tally No. 1 and 2 Com., $23.50.
Three cars No. 1 Com. and Bet., 80 per cent. firsts and seconds, $30.00.

All well manufactured stock, winter cut, bone dry. Apply immediately, Box 64 Canada Lumberman, Toronto. 15

We Own and Offer

subject to prior sale, the following Rock Maple lumber:

200,000 ft. 1sts and 2nds 4/4 in., $33 per M.

Wanted-Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents.

WANTED—Position as sawyer, circular or band. Can furnish good references; open middle of July. Box 77 South River, Ont. 14-15

Experienced lumberman is open for position on road, or would take management of retail yard. Address Box 65, Canada Lumberman, Toronto. 15

Position wanted as practical sawmill foreman. Twenty years' experience. Can furnish the best of references. Address Box 51, Canada Lumberman, Toronto. 14-t.f.

Wanted position as shipper or foreman or both in small plant, soft or hardwoods, twenty-five years' experience. Can furnish first class references. Box 56 ,Canada Lumberman, Toronto. 15-17

WANTED—Position in Saw or Planing Mill. Office and mill experience. Could take charge of Sales, or act as Mill Foreman or Yard Foreman. Excellent references. Box 44, Canada Lumberman, Toronto 13-16

EXPERIENCED SUPERINTENDENT wants position to take charge of lumbering operations, bush, mill, etc. Desires a change. Can get results and furnish the highest credentials. Box 46, Canada Lumberman, Toronto. 13-17

A thoroughly practical lumberman wishes to connect with reliable firm either as salesman or buyer. Ten years as partner in well-known Ontario lumber firm—six years' experience selling on road. Familiar with every angle of lumber business. Would consider salary or commission proposition. Best of references. Full particulars from Box 37, Canada Lumberman, Toronto. 12-15

Woods or Mill Manager—Position wanted in New Brunswick by thoroughly experienced manager, who has had 17 years' experience in woods and mill management, has always been successful in handling large crews and understands all details of the work, is a first class bookkeeper. Has been for upwards of ten years with firm of lumbermen at present employed by. First class references; can be at liberty in two months. Address in first instance Box No. 57, Canada Lumberman, Toronto, Ont. 15-16

Do You Want to Buy or Sell?

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department."

Wanted-Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

WANTED—A young man with experience as salesman for sash and door factory. Apply to Box 38, Canada Lumberman, Toronto. 12-15

Wanted—Man with experience in getting out saw logs from stump to mill. State salary and references. No boozers need apply. Box 62, Canada Lumberman, Toronto. 15-16

Lumberman with small capital wanted to take on contract to lumber and saw material on small limit. Sawmill and other tools supplied to good man. State experience and capital, in confidence to Box 60, Canada Lumberman, Toronto. 15

Woods Manager Wanted

Thoroughly practical man required to take charge of large woods operation; must have considerable experience in driving. Salary one hundred and twentyfive dollars month, with increase after ability is shown. Apply by letter ,stating experience and references, to Box 200, Canada Lumberman, 119 Board of Trade Building, Montreal. 15-16

Business Chances

For Sale

Timber Limits, principally Hemlock, also Pine, Spruce and Hardwood. Also Saw-mill, logging and driving outfit. About quarter million burnt timber to be disposed of at a reasonable price. For particulars address Box 52, Canada Lumberman, Toronto. 14-17

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest. If your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf

An Opportunity—Sawmill Wanted

for Hardy Bay, north end of Vancouver Island, B.C. Fine harbour, projected terminal for C. P. R. Free site and bonus for responsible parties. Large amount of timber (gratis) in immediate neighborhood. Write for full information. Bagshawe & Co., 214 Pemberton Building, Victoria, B.C. 15-18

For Sale

Rare bargain. Band mill located in best lumber and log center on Puget Sound. Rail and cargo shipping facilities. Excellent log pond. Ten and a half acres of land. Price one-fourth of appraised valuation. Must sell quick. Box 765, Canada Lumberman, Toronto, Ont. 8-t.f.

For Sale

Timber Limits and Saw Mill

Limits No. 59 River Gatineau, 3 square miles, and No. 483 Grand Lake Gatineau, 40 square miles, say 43 square miles, under Quebec Government Licenses. These limits are well wooded and contain Basswood, White and Red Pine, Spruce, Birch, Poplar, Cedar, Pulpwood, etc., also New Waterous 8-ft. Improved Double Cut Band Mill, fully equipped and up to date 200 H.P. Engine, 2 Boilers, Alligator, Boats, Booms, Logging Gear, Waggons, Trucks, etc., Buildings, Camping Outfit, etc., situated at Matts Bay, 31 Mile Lake, P.Q., about 50 miles from Ottawa. This plant has only been in use three years and is in condition to start operations at once.

For further particulars apply to

GUARANTY TRUST COMPANY, LTD.,
802 E. T. Bank Building,
263 St. James Street,
13-16 Montreal, Que.

An Experienced Lumberman

Wanted—to manage thriving retail lumber yard in Ontario town. Turns over from $150,000 to $200,000 per annum and earns from 25 to 30 per cent. on investment. Owners would sell part interest to right man. Apply to Box 61, Canada Lumberman, Toronto. 15

Tenders for Fallen and Burnt Timber

Tenders will be received by the undersigned up to and inclusive of the 15th day of September, 1914, for the burnt and fallen timber on Berths 2 and 4, Township of Nipissing.

Also tenders will be received for Berths 2 and 4, Twp. Nipissing and Berth 4, Twp. Gurd.

The highest or any tender not necessarily accepted. For par iculars address

ALEX. BLANCHARD,
Box 265 North Bay, Ont.

Miscellaneous

Saw Mill Machinery For Sale

Sawmill near Sellwood, Ontario, daily capacity 60,000 feet. All machinery including:—Log Ladder, Bullwheel, Steam Kicker, Log Loader, Stationary Steam Nigger, 42-in. Steel Carriage, 10-in. Steam Feed, 8 ft. Double Cutting Bandmill, Cast Iron Lumber Table, 5-Saw Slab Slasher, 48-in. Big Champion Edger, Trimmer, Transfers to Edger and Trimmer Tables, Sorting Tables, etc. Also, Independent Lathmill, Filing Room Outfit and Power Plant complete. This machinery is of the latest design, practically new and in excellent condition. Offers will be accepted for all or any part of this machinery, where it stands or F.O.B. cars Sellwood.

The Waterous Engine Works Company,
22-t.f. Brantford, Canada.

Timber Preservation

The most notable progress yet recorded in the chemical treatment of timber to prevent decay was made in 1913, according to a report recently issued by the American Wood Preservers' Association in co-operation with the forest service of the Department of Agriculture.

The report states that 93 wood-preserving plants in 1913 consumed over 108,000,000 gals. of creosote oil, 26,000,000 lbs. of dry zinc chloride, and nearly 4,000,000 gals. of other liquid preservatives. With these the plants treated over 153,000,000 cu. ft. of timber, or about 23 per cent. more than in 1912. The output from additional plants unrecorded would increase the totals given.

Impregnation of wood with oils and chemicals to increase its resistance to decay and insect attack, the report goes on to say, is an industry which has become important in the United States only in recent years. In Great Britain and most of the European countries practically every wooden cross-tie and telephone or telegraph pole receives preservative treatment. In the United States less than 30 per cent. of the 135,000,000 cross-ties annually consumed are treated, and the proper treatment of an annual consumption of 4,000,000 poles may be said to have scarcely commenced.

Real progress in the United States dates from 1852, when the Kyanizing process, using biclorides of mercury, was developed. In 1837 two other processes were introduced, the Burnett process using zinc chloride, and the Bethol process using coal tar creosote. These last processes are very largely in use today.

The idea of timber preservation at first made very slow growth in this country, on account of the large supply of cheap and durable timbers and the general disregard shown toward economy in the use of natural resources. In 1885 there were only three pressure plants in the United States; and in 1895 only 15. Since then, however, the industry has grown rapidly; in 1913 there were 117 plants.

Wood Used by Stave and Box Men

The U. S. Forest Service, after two years or more of investigation in all portions of the United States, has published figures showing how much wood passes through factories yearly, and how much goes into each industry. Fifty-five industries were separately investigated. It was found that 24,673,846,064 feet of wood of nearly 100 kinds is converted into finished products in course of a year. The total sawmill output of rough lumber, including large mills and small, is approximately 45,000,000,000 feet a year. Considerably more than half of it is, therefore, manufactured further before it reaches its final use.

It is interesting to note how much of this goes into boxes and cooperage. The Forest Service's figures show that, next after planing mill products, boxes constitute the largest wood-using industry in the United States. The annual use of wood in certain items is shown as follows:

Slack staves, 2,029,548,000 pcs.; slack heading, 140,234,000 sets; hoops, 375,793,000 pcs.; tight staves, 379,231,000 pcs.; tight heading, 20,691,201 sets; boxes, 4,547,973,180 feet; woodenware, 405,286,436 feet; tanks, etc., 225,617,686 feet; tobacco and cigar boxes, 63,154,226 feet; bungs and faucets, 21,112,342 feet.

Canadian vs. American Banking

There has been considerable discussion going forward in the American press regarding the superiority of the Canadian banking system as against the American system of financing. The statement has been made repeatedly that the elasticity enjoyed under the Canadian system permitted a freer and easier movement of money where it was most needed. A well known British Columbia lumberman in discussing this subject with "The Timberman," says: "I have noted the frequent references to the advantages of the Canadian system of banking as compared with the American but I want to give you a close range view of the situation insofar as it affects British Columbia lumbermen. You will understand that there are comparatively few banks in Canada each of which has a large number of branches scattered throughout the Dominion. Managers in charge of these local branches have only a limited discretion in making loans. Whenever a situation arises when the head office decides these loans should be partially curtailed or entirely called in, this decision is communicated to the local manager who is given little authority or discretion and he must carry out the wishes of his superiors irrespective of the local conditions governing the particular industry in which the borrower may be engaged. It is not uncommon that borrowers have been compelled to take a three thousand mile trip to lay before the directors the actual conditions and if possible secure an extension of the loan until such time as conditions will permit a reduction of the account to be made. No such condition as this as I understand it, obtains in the United States for the reason that the bankers who make the loans have the power of extension in their hands. This is a form of elasticity which the Canadian banking system does not enjoy and it is often appealed to me that if the American customers of the banks understood this relation they would feel more satisfied with their own system. Far pastures always look greener."

The Handle Sells the Axe

It is said that the popularity of American axes in many foreign countries is due more to their hickory handles than to the metal in the bit or the pattern of the tool. Foreign factories can work metal about as well as it is worked in this country, but foreign forests do not grow hickory or any other wood like it. That must come from America. The same observation holds in regard to many slender-handled hammers. Their hickory handles sell them in many foreign markets. This has been shown in numerous instances when attempts to sell the hammers without the handles have been unsuccessful.

Northern Ontario Pulp Wood

The shipments of pulp wood in Northern Ontario by the Temiskaming and Northern Ontario Railway have fallen off considerably this season. The returns for May giving the shipments to Niagara Falls, Thorold, Merritton, Port Huron, Sturgeon Falls, Johnsonburg, and other points of destination, as compared with shipments for the corresponding month in 1913, show that the decrease has been 390 cords. In May, 1913, there were shipped 131 cars containing 1,890 cords, and in May, 1914, there were 112 cars containing 1,500 cords. The past few weeks have been very favorable for settlers working on the land, and their attention has been given more to the cultivation of the constantly enlarging clearances than to wood cutting.

Flooring One-half Inch Thick

The latest thing in hardwood floors is said to be plain and quarter-sawed oak one-half inch thick in the finished size. This is tongue and groove flooring and is destined to take the place of the regulation 1 x 3-inch flooring, which is finished 13/16 x 2¼-in. face. The new thickness in actual practice proves as durable and makes as good a floor as that which is 13/16-inch thick and it has the added advantage of being more reasonable in price and of wasting less in laying. The regulation 13/16-inch flooring wastes one-third, whereas the ½-inch, being 2-inch face measured as 2½ inches, wastes only 25 per cent. It is stated that there is a saving in the cost of ½-inch floor of from 19 per cent. to 25 per cent. Of course, it is needless to say that the ½-inch flooring is immeasurably superior to the cheaper flooring strips that are being laid to such an extent, as well as the ⅜-inch material. It is quite probable that before long the ½-inch flooring will become the standard size in hardwood flooring.

Cleans a building of Rats and Mice in short time, keeps it cleaned, for it is always ready for use. Made of galvanized iron, can't get out of order, lasts for years. Large number can be caught daily. Go to Catcher mornings, remove device inside, which only takes few seconds, take out dead rats and mice, replace device, it is ready for another catch. Small piece cheese is used, doing away with poisons. Catcher is 18 inches high, 10 inches diameter. When rats pass device they die, no marks left on them. Catcher is always clean. One of these Catchers set in a livery stable in Scranton, Pa., caught over 100 rats in a month. One sent prepaid to any place in Canada or United States upon receipt of $3. Catcher, 8 in. high, for mice only, prepaid $1. On account of shipping charges being prepaid, remittance is requested with order.

H. D. SWARTS,
Inventor and Manufacturer, Scranton, Pa.

Review of Current Trade Conditions

Ontario

A little more activity is reported in connection with the biulding trade in some of the larger cities of Ontario, but in spite of this the wholesalers and manufacturers of lumber do not report any important improvement in the trade situation. The natural conclusion is that the retailers still have sufficient stock to handle the amount of trade that is in progress. Wholesalers are divided in regard to the outlook. A few who expect that the crop situation will be the important feature are looking for a turn for the better in the course of the next month or two. There are many however who take quite a different view and believe that the present quiet season will extend for several months. The opinion is unanimous that trade is much quieter than usual at this time of year, and very few seem to feel that any improvement can be expected for some time. If one were to take the opinions of the retailers however, as a guide, he would form a much more encouraging view as to the trade situation. The general lack of definite information upon which to base opinions is causing manufacturers and wholesalers a great deal of uncertainty. The trade however, is acknowledged to be in a remarkably sound condition, considering the trials which it has passed through. Stocks are not too large at any point, between the mill and the consumer. Prices are showing no tendency to sag, and it is expected that even a further prolonged period of dull trade will have little or no effect upon prices. The trade question seems to be simply one of how long we must wait for a revival. An indication of actual building in some of the larger centres is afforded, by the case of Toronto in which building permits were issued during the first six months of the present year, which amounted to $13,976,140, as compared with $13,584,725 during the corresponding six months of 1913, which was a record year.

In the hardwood trade a fair movement is reported in 1-in. birch, also a small movement in the larger sizes. The different thicknesses of elm are also moving to some extent. The market is very quiet. There is a steady demand for brown ash and it is generally reported that there are no stocks in sight to move.

The local trade in Ottawa is a little better than it has been of late, on account of an improvement in the building trade. The general trade however is still dull, and prices have shown a decline of from one to two dollars, for several grades of pine. Ottawa mills are still troubled for lack of water. Several of the large plants have only sufficient logs to keep the mills going. Activity in connection with the lumber camps is reviving. There will probably be plenty of men for the woods this year, and wages will be about five dollars lower than they were last year.

Eastern Canada

Fairly active business is reported from St. John, N.B. Prices in general are steady, without showing any indication of advance. All the mills in St. John are running full time. A free movement is reported for refuse lumber. Refuse lumber is selling at about $12.00 per M. feet at the mills. Merchantable spruce boards are bringing $16.$16.00 and merchantable hemlock boards planed on one side, $17.00 at the mills. Prices of English deals in England are reported to be a little lower, but this is not affecting sellers or shippers in New Brunswick to any great extent, as most of their orders have been placed well in advance. No change is reported in the American market. Fair business is reported by some shippers who sold ahead, but those who have to sell on the present market are finding it difficult to get profitable prices. Lath continue steady at about $3.00 per thousand on seller's wharf. St. John shingles continue quiet for the high and low grades, but second clears are selling rapidly. A drop is reported in the price of hardwood deals, and many cuts are still said to remain to be shipped. The box trade is very quiet.

There is nothing new to report in lumber market conditions in Montreal. Buyers are only ordering what they require immediately. Large consumers, such as railway car shops, are purchasing very little stock. Sash and door factories are not receiving anything like a normal quantity of orders. Exports to Great Britain are scarce, as stocks of white pine on the other side are large.

The regular base quotation for spruce at Boston is $23.50 with some business at $23. Random is quieter, present prices are: 2/3, $20.50 to $21.00; 2/4, $21.50 to $22.00; 2/5, 2/6 and 2/7, $20.00 to $21.00; 2/8 $22.00 to $22.50; 2/10, $23.50 to $24.00; 2/12, $24.00 to $24.50.

The movement in spruce boards is quite small, the top price for random boards 5-in. and up wide, 8 ft. and up long planed one side, is $22.00. Some fair boards are selling at $20.50. There is a fair demand in Boston for good lath. The best 1⅝-in. bring $4.10, although a few bids for $4.05 and $4.00 are reported as having been accepted.

The usual quotations for 1½-in. is $3.75, but there are some transactions at $3.70 and some at $3.80. The demand for shingles is good, with white cedar extras selling well at $3.50 and some choice brands at $3.65. Clears are selling at a range between $2.85 and $3.05, and second clears at $2.75 to $2.80.

Great Britain

The Board of Trade Returns for the first six months of 1914 shows that there has been a decrease in imports into Great Britain of £2,862,710, and in the exports of £1,598,197, as compared with the record half year of 1913. A comparison with the same period in 1912 which was a more normal year however, shows that the trade for the present year has been extraordinarily good. The 1914 figures for January to June show an increase in the imports of £22,000,000, as compared with the corresponding period in 1912, and an increase of £30,000,000 in the exports. Imports of hewn timber from Canada during the six months were valued at £84,579, as compared with £86,105 in the first six months of 1913.

The trade in London continues quite unsettled. The demand is quite up to the average, but everyone seems to report very little business done. The deliveries at London docks for the week ending July 4th amounted to 11,832 standards, as compared with 5,229 in the corresponding week of 1913. At Foy, Morgan & Company's recent auction sale 3 x 9 in. first Quebec spruce was sold at £14 15s.; 8 in. £12 10s; 7 in., £12; 3 x 9 in. second Quebec spruce £11 15s.; 3 x 7 in. second £9 10s.; 3 x 9 in. fourth Quebec £10 and £9 15s., and fifth £9.

Nothing of importance has developed in the soft wood trade at Liverpool. A fair sized business is in progress in some branches. The c.i.f. market for spruce is quiet, and the market appears to be more than amply supplied for some time to come. Demand is dull. The large quantity of spruce now on the quays especially at Manchester has brought about the usual result, and the export field is anything but firm. Consumers seem to be satisfied with buying for immediate requirements and speculation is absent. The Timber Trades Journal in a recent issue says:—"Even the higher grades such as Miramichi are not realizing a profit on cost, notwithstanding the fact that they cannot now be purchased at within a trifle of the prices realized earlier. The only size of which there appears to be any scarcity is 2½ x 7. Scantlings, which are usually very much in request, there is very little call for, thus providing to a great extent the position of the building trade. We have not heard of any cargo transactions this week from New Brunswick or Nova Scotia to arrive, and under the present conditions it appears as if they would be difficult to make."

The c.i.f. value of birch shows no change, and business is rather quiet. Fairly reasonable prices have been secured for a few recent contracts for log timber. Canadian pine deals are unchanged. Reports from Manchester state that spruce deals are weaker and the demand is poor.

United States

Reports upon business conditions in United States indicate that the extraordinary crop estimates are continuing to have a beneficial effect upon trade. It is generally believed that if the Government preliminary reports are followed by equally satisfactory ones, trade conditions will be certain to improve. Travellers in the central west report that a heavy volume of business is to be expected in the fall. The most satisfactory indication of improvement is the fact that the Pullman Company, which laid off its men last spring, is now employing ten thousand men against a normal staff of thirteen thousand. Freight car shops are busy once more and are increasing their staffs. Reports point to a certainty that the railroad companies will have sufficient business in the fall to tax their capacity. This means that new equipment and repairs to old equipment will be required. Under these conditions steady growth of trade is expected during the next six months.

Manufacturers of southern pine are still holding to the recent price advance, and are expecting, in the fall, to recover any loss of business resulting from the present firm prices.

Better business conditions are reported on the Pacific Coast, and retailers in the middle states are placing orders in anticipation of a good fall trade. The prices, although still unsatisfactory are from fifty cents to one dollar higher than they were two weeks ago. Red cedar shingles are firm at $1.60 for stars, and $1.90 for clears. Sugar pine and white pine mills are in the middle of their selling season, and report eastern shipments going forward without any great trouble from car shortage. The northern pine trade shows a steady improvement, and the manufacturers are expecting a revival of business from now on. Hemlock manufacturers expect heavy business in the

fall, as Wisconsin, Michigan, Minnesota, and Illinois are all certain of big crops.

Piece stuff and boards are bringing $17.00 and $21.00 in the Saginaw Valley. Hemlock is more active in the east on account of improvement in the suburban building situation.

Hardwoods show no important change. Consuming factories are buying only for their immediate requirements. There is a good movement in quartered oak at steady prices. In the northern hardwood list the demand is not heavy but the situation seems to be well in hand with prices firm.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

Ottawa Trade Finds Demand Dull

Ottawa, July 23 (Special to the Canada Lumberman): On account of a renewed activity in the building trade the lumber business locally is fairly brisk, but generally things are quiet. Owing to the lack of demand there has been a falling off in the prices in several grades of pine during the last two weeks. Pine good strips, 1-in., formerly $40 to $42 are now $38 to $40. Pine good strips, 1¼ and 1½ ins., formerly $52 to $54, are now selling at $50 to $52. Pine good shorts, 1 in x 7 in., and up, which were $42 to $44, can now be bought for $40 to $42 and the same grade, 1 in. x 4 in., to 6 in., have fallen from $32 to $35 to $30 to $33. Pine No. 1 dressing shorts, which for some time past brought $22 to $26, are listed at $22 to $24; Pine s.c., 12 ft. to 16 ft. formerly $26 to $27 now sell at $25 to $26. Pine s.c., and better shorts 1 x 5 in., formerly $21 to $22, are now $20 to $21. Pine s.c., and better shorts, 1 x 6 in., formerly $21 to $22 are now $20 to $21. Pine s.c., shorts, 6-11 ft. 1 x 10 in., formerly $24 to $25, are now $23 to $24.

Operations in the saw mills throughout the Ottawa district are still more or less handicapped by lack of water and it is likely that the cut this year will be considerably lower than it was in 1913. The Colonial Lumber Company, of Pembroke, are getting just about enough logs down to keep the mill going, and the Pembroke Lumber Company is in the same plight. J. R. Booth's cut will of course be substantially less this season, owing to the breaking of a flume wall about a month ago, which put the saw mills out of business as well as some of the other parts of the plant. The necessary repairs were completed and operations were to be resumed again by the 27th.

By the 15th of August most of the lumber camps will be in operation along and adjacent to the Ottawa River and its tributaries. The advance parties of handymen left to get the camps in readiness for the main force of lumberjacks about a week ago. Some firms will operate several additional camps this year so that they can cut into logs the timber blown down by the hurricane that swept through the country last fall. Wages in the camps will, it is said, be considerably less than last year. Leading lumbermen of this district have arranged to meet on Friday to discuss the scale of wages to be paid. Report has it that the scale will range from $20 to $30 per month with board, compared with $25 to $35 a year ago. At the reduced rate there will be no dearth of men. For several months past Ottawa has been literally flooded with hundreds of unemployed men and the opening of the camps is being hailed with delight by those among the workless who really want to work and have had some experience in the bush.

Word has been received by J. R. Booth and Shepard and Morse that forest fires are raging near Silver Center, Ont., and endangering valuable limits owned by the two firms mentioned. If rain comes soon and the wind does not rise the fire-fighters say they will be able to hold the fires in check.

Many Logs Stranded by Break in Dam

As a result of the break in the Conservation Dam at Lakes Temiskaming and Kippewa, a few weeks ago, great quantities of logs have been left high and dry on the shores of the lakes and the work of floating them has now been commenced. For this purpose hundreds of unemployed men have been sent up from Ottawa to work for a firm of government contractors, to which has been given the contract for clearing the logs into the water.

Application has been made to the Department of Public Works at Ottawa by the Lake of the Woods Boom Company for approval of the plans and site of a boom to be constructed at the head of the Rainy River opposite the Wild Lands Reserve. The boom is to be used for driving logs to the mills along the Rainy River.

About a week ago the main pumps at the waterworks in Ottawa broke down and created a serious situation. Mr. J. R. Booth, the veteran lumberman relieved a good deal of anxiety when he wrote to Mayor McVeity stating that in case of fire he would close down his whole plant temporarily and thus enable the city to obtain an extra supply of four million gallons of water. Another example of Mr. Booth's generosity was manifested a few days ago. John Castaigne, a blind man, has for the past five years conducted a small restaurant on the Booth property. Changes at the plant required Castaigne to move. Realizing that the blind man would suffer a loss Mr. Booth had a much larger establishment built for him in a more convenient place and also sent a gang of men to help Castaigne move into his new quarters.

The Estate James Davidson has just received a small order from the Dominion Government to which considerable interest attaches, the order being for 24 oak toboggans which will be used by the party of Royal Northwest Mounted Police who will start shortly to hunt for the Eskimos who murdered Street and Radford, the two white hunters and engineers.

St. John Markets Fairly Active

St. John, N.B., July 20th (Special to the Canada Lumberman): During the last month business has been fairly active in the local market. Prices have been maintained, but no advances can be said to have taken place. No great quantity of stocks are coming into St. John for local consumption outside of the regular stock being manufactured at the mills. All the mills are running full time, with abundance of help and no labor troubles. Refuse lumber of all kinds has been moving very freely, also merchantable spruce boards, and merchantable hemlock boards, both grades being well used up to saws. Prices for refuse lumber run about $12 per M. at the mills here. Merchantable spruce boards bring $16 per M, and merchantable hemlock boards planed one side $17 per M. at the mills. As we have stated before, about all the cuts of English deals (and all but two mills are sawing them) have been sold ahead at good prices, and while the prices in England are not quite so good, yet this will hardly be felt by the sellers or shippers here, as it was well placed ahead. Shipments from St. John during the past month have not been heavy, but as a good many sailings usually take place during late July and through August, the shippers will probably clean up a good many deals during that time. Geo. McKean is loading a steamer with about three million feet for Manchester; Mackay and Moore, are both loading some stock in steamers and sailing vessels.

In the American market, very little, if any, change has taken place. Some shippers who sold ahead, report fair business, but those who have to sell on the present market report it hard to find buyers at profitable prices. It is said that cargoes running to average 16 feet or thereabouts, a good line of 2 x 8, will net the seller about $16.50 to $17 per M. here. Very few cargoes are being sent forward. The only two mills sawing for the American market at this port are Messrs. Stetson Cutler Company's, and they are not shipping to any great extent. Laths are the only commodity in the lumber market in the United States which seem to hold their own. The price for laths has held steady to date at about $3 per M. on seller's wharf here. A good many of the laths being shipped from here are going to Philadelphia via the Manchester steamers.

Shingles remain quiet, with no demand for the high grades, or the extra low grade, but about all the second clears are taken up from the mills about as fast as sawn.

Freights for ocean trade are about 35 shillings to Liverpool and Manchester from here. Whether there will be a further change in freights remains to be seen. Some people claim that large quantities of grain remain on this side to be shipped over, which, if it is so, will have a tendency to put in use a good many more steamers, and the lumber freights may advance. In the coastwise trade to New York, freights remain at about $2.75, and it is very hard for vessel owners, of sailers especially, to find freights. As very few shippers wish to put their lumber on the present market, the reason for low freights can be well seen.

The hardwood deal trade from St. John has had quite a setback, as all through the winter and early spring prices for this kind of wood were very high, rotary cuts being sold at about $17.50 per M. for specifications running 9 ft. and up long, 3 x 6 and up wide. But during the last month the price has taken a fall and many cuts yet remain to be shipped, and unless contracted for will have to be sold at unprofitable prices.

The box trade still remains in a sleeping condition. No run of fish has yet taken place so as to give an impetus to this trade.

Exercise

Exercise your muscles for your physical welfare and Exercise your judgment for your business welfare.

You can exercise no better judgment in the selection of your requirements for Dressed Spruce than to use Fenderson's, the "Quality Stock." This stock is the standard by which Dressed Spruce values are judged.

We have never aimed to make the lowest prices—but we always do give the greatest value for every dollar. It's like your clothes. You can buy them for half what you are paying, not as good, of course. It's the same question of value.

Dry stock—prompt shipment—smoothest dressing—best grades.

Try Fenderson Service

You'll like it.

Montreal Markets Unchanged

Montreal, July 27th (Special to the Canada Lumberman): No alteration of any importance has occurred in market conditions since the last report. Orders are only of moderate volume, buyers being disinclined to purchase, except for immediate requirements. The slackness in such large plants as the Angus shops of the Canadian Pacific Railway has affected local wholesale lumbermen who sell to the large corporations which are heavy consumers of lumber. Retail yards report that trade is slow, and as there is little prospect of a revival in building, the outlook is not particularly bright.

The better grades of pine continue to be in poor demand. Prices too, are inclined to give way in view of the limited market for this description of lumber. The high value to which the good grades of pine reached have brought into use many other kinds of lumber as substitutes, and this has had a depressing influence on prices. With rare exceptions, the sash and door factories are short of orders.

Exports to Great Britain exhibit the same unsatisfactory conditions. Stocks of white pine on the other side are very large, and under these circumstances exporters are holding their hands. The competition of Baltic pine with Canadian red pine is as keen as ever, and tends to restrict shipments from this port.

The ground wood market is steady. There is however, not a great deal of business passing, especially in the United States, where the demand for wood paper is quiet. Canadian trade for news print is satisfactory. Although chemical pulp is selling well, prices are low. The immediate outlook is fairly good.

Glasgow Quarterly Report

Edmiston & Mitchells', Glasgow, in their qaurterly timber circular under date of July 1st, say: Trading conditions in this district during the past quarter have proved of a most disappointing nature, the demands in evidence, apart from those emanating from the shipbuilding industry, having been consistently dull and inextensive. The continued activity in the shipyards was responsible for a steady flow of orders from that source, in which teak and pitch pine predominated, but the other wood-consuming industries have all yielded demands of more or less meagre proportions. A cause which had an undoubtedly adverse influence on the consumption was the fact that a good deal of uncertainty has existed amongst buyers as to the probable course of values, and for this reason they have shown a strong inclination to keep down their stocks as much as possible, and hand-to-mouth buying has therefore been unusually prevalent.

Values generally have displayed a rather easier tendency, although, in view of the apathetic demands in evidence, they have really kept up surprisingly, a fact due in large measure to the lightness of imports.

The Clyde Shipbuilding returns show that the output for the first six months of the year amounted to 117 vessels of 275,128 tons, as compared with 91 vessels of 343,312 tons in the same period last year, and 143 vessels of 297,599 tons for the first six months in 1912. There is still a large amount of work on hand, and most of the yards are assured of steady employment for some time to come, but there is a regrettable falling off in the new orders being placed.

Imports from British North America

Yellow pine logs.—A few sales transpired during the past three months, although at prices considerably under the import cost. Stocks are still heavy, however, being 2,402 loads, equivalent to 18 months' requirements at the present rate of consumption.

Oak logs.—A moderate demand has existed for 1st class timber of good average dimensions, and there is little wood of this description remaining in first hands now. There is still a good deal of small and 2nd quality timber on hand, which is moving very slowly.

Elm logs.—There was some enquiry for large 1st class rock elm for shipbuilding purposes, a few sales being reported at firm prices, but there has been little demand otherwise. The stock now stands at 1,113 loads, and averages 40 cubic feet per log.

Birch.—Logs.—Arrivals were moderate in extent and consisted in large part of 2nd quality wood, but the whole was sold on ex quay terms. There is a brisk demand for 1st class logs of good average, prices of which are meantime firm. Planks.—A few small shipments have cone forward and were readily sold at firm prices. A fair enquiry exists, and there is room for a few consignments.

Yellow pine deals and sidings.—The demand all over has been quiet and sales mostly of a retail character. Shipbuilding requirements have no doubt absorbed a moderate quantity of sidings and the lower qualities of deals, but this accounted for the bulk of the movement. Values have ruled rather easier.

Spruce deals.—Arrivals were light and stocks are now well reduced. Sizes 8-inch and wider have met with fair request, but the narrower widths have proved slow of sale. Values are easier.

The demand for cedar logs in British Columbia has improved greatly of late and prices have gone as high as $13.00 in some instances. This price, of course, is for specially good booms. The average price is between $10.00 and $11.00. Cedar shingles and boards are quoted at $4.75 to $5.00. The supply of logs was plentiful, the cut in May having been 59,000,000 feet and in June, 60,000,000 feet. The demand is not very strong, and sum of the camps will reduce their operations in the near future. Prices have fallen, logs are $6, $8 and $10.00 for camp's run. The domestic lumber trade is reported to be fairly extensive, but prices are not improving.

Liverpool and Manchester Stocks

H. W. Lightburne & Company, Liverpool, England, report the import, consumption and stocks at Liverpool and Manchester for the month ending June 30th as follows:—

Glasgow Market Still Quiet

Calder, Henderson & Livingston, Glasgow, in their quarterly timber report under date of July 1st, include the following:—

Canada—St. Lawrence, Yellow pine—Waney.—No import. Although some slight improvement is noticeable in the consumption the position still remains very unsatisfactory. The stock, principally composed of deckwood, is far too heavy, while values are weak, and the demand is stagnant and not likely to improve under the quieter conditions now ruling in shipbuilding. Orders for first-class shipbuilding wood of large average were keenly competed for and sales were made around 4/- to 4/3 per c.ft. Second class wood of ordinary average was sold at from 2/- to 2/3 per c.ft., and the stock is now cleared. Square.—A small lot of mixed quality was disposed of at 2/3 per c.ft.

Birch—logs.—Arrivals of first class were moderate and came forward principally in fulfilment of contracts. Consigned parcels met with a fair demand and 16-inch average was sold around 2/- to 2/1 per c.ft. A fair quantity of second class wood was disposed at from 16d. to 19d. for 15 to 17-inch average. The stock is light and the figures appearing in the tables represent chiefly Round logs stored on account of a large consumer. There is a fair inquiry for first class logs 16-inch and up average. Planks.—Some contracting for a fair quantity has taken place, the price it is reported being 19½d. per c.ft. ex quay. Consigned parcels have come forward sparingly and brought 19½d. to 20d. per c.ft. Stocks are moderate and are in second hands. The demand is not brisk.

Deals, battens and boards.—The quantity imported has been very moderate, but has more than met the demand which has been slow. Stocks of first and second qualities are light, while third and fourth qualities though not heavy are ample at present. Values on the whole are about steady. A fair quantity of good pine sidings has been moved, but the stocks are still to the heavy side and values are easy, especially for narrow specification.

Pine—Firsts,—Broad deals were only occasionally asked for and sold at from £39 to £41 for about 13 to 14-inch average. Regulars were enquired for, but no transactions took place owing to the want of stock. Undersizes brought from £28 5s. to £29 10s. Good sidings sold from £30 15s. to £31 10s. per St. Petersburg Standard for 12 to 13-inch average. Seconds.—Enquiries were few. Deals 12-inch and up were sold at from £30 5s. to £31 5s. Of Regulars no sales came under notice. Undersizes fetched from £19 5s. to £20 10s. per St. Petersburg Standard. Thirds.—A moderate quantity was moved. Deals 12-inch and up sold at from £19 5s. to £19 15s. Regulars were disposed of at from £17 15s. to £18 5s. Values are inclined now to be a little easier. Undersizes brought from £13 15s. to £14 10s. per St. Petersburg Standard. Fourths.—All specifications were neglected

and present quotations are nominally around £13 to £13 10s. for Deals 12-inch and up, £12 15s. to £13 for Regulars, and £10 5s. to £11 per St. Petersburg Standard for Undersizes.

Red pine.—A small consignment of Deals 4 to 6 inches thick x 9 and 11 inches broad brought £13 to £13 15s. per St. Petersburg Standard. There is only a small stock, but the demand is almost nil.

Spruce.—The demand has been dull and there was only a moderate consumption. Enquiries have been chiefly for 9-inch and up. Values on the whole have been fairly steady. The stock is not heavy and is held chiefly by merchants.

New Brunswick and Nova Scotia Birch—Logs.—A small quantity came forward on contract and went direct into consumption. Stocks are very light and enquiries are not numerous. Values are steady. Planks.—Were moderately imported, principally on contract. The demand is quiet. The stock is held on merchants' account.

Pine.—Some small consignments came forward, but owing to the poor demand went to store.

Spruce.—Stocks are not heavy, but are sufficient for the exceedingly poor enquiry. The sizes principally asked for were of the wider specifications and these sizes are now exhausted, but the narrower deals were slow to move. Values drooped but are now about steady at a lower level.

Liverpool Trade Disappointing

Farnworth & Jardine, Liverpool, England, in their monthly wood circular under date of July 1st, state that the demand during the previous month was quiet and business was disappointing. In regard to Canadian woods they report as follows:—

Pine Timber.—The market shows no change. Waney pine, 1st class.—There has been a considerable import to Manchester, deliveries have been small, the demand is dull, and stocks are adequate. 2nd class.—Consumption has been very small, and there is little enquiry; prices unchanged. Red pine.—Practically no movement to report. Oak.—The light arrivals have been to Manchester, against contract; consumption about kept pace, and prices are steady. Elm.—Arrivals have been entirely against contracts; deliveries have been merely nominal; the demand is quiet, but prices remain firm. Pine deals—A moderate import to both Manchester and Liverpool; consumption, though larger than last month, is still rather small, and stocks are heavy; prices show no change. Red pine deals.—The import exceeded the consumption, and the market remains dull.

New Brunswick and Nova Scotia spruce and pine deals.—The import to the Mersey (including Manchester) was heavy, amounting to 17,230 stds., as against 15,030 stds. for June 1913, about 70 per cent going to Manchester; the consumption was disappointing and below that of the corresponding month last year; stocks are too large, amounting to 26,070 stds., and sales are difficult, but prices keep fairly steady. Pine deals.—The import has been on merchants' account; there is fair enquiry at steady prices.

Birch.—Logs—Arrivals amounted to 59,000 feet, practically all from Quebec; deliveries satisfactory in Liverpool, but disappointing in Manchester; stocks are fairly moderate, and prices remain firm. Planks.—For the time of year the import has been small; deliveries have been fair; stocks show a slight increase, but prices no change.

British Columbian and Oregon pine.—12,000 cubic feet imported; consumption shows some improvement, but stocks are still large, and prices easier.

In their quotations of current prices they report as follows:—

The scaling operations of the Forest Branch of the Department of Lands of British Columbia show that logging operations in the province are improving. Since May the Department has been scaling at the rate of 60,000,000 feet per month.

London's June Imports

Churchill & Sim, London, Eng., in their monthly wood circular under date of July 2nd, report importations from the St. Lawrence during June as follows:—

Pine deals, 112,000 pieces, against 103,000 pieces in 1913.
Spruce deals, 82,000 pieces, against 118,000 pieces in 1913.
Birch planks, 19,000 pieces, against 48,000 pieces in 1913.

and from New Brunswick—

Pine deals, 3,000 pieces, against nil pieces in 1913.
Spruce deals, 128,000 pieces, against 267,000 pieces in 1913.
Birch planks, 266,000 pieces, against 235,000 pieces in 1913.

Importation of pine and spruce has been small, and prices for pine deals are unchanged, good parcels still commanding high figures, but inferior shipments are difficult to dispose of, except at very low rates. Spruce has arrived sparingly and the available stock is lower, but prices are kept down by competing shipments from the north of Europe. Birch planks are heavy in stock, but fair prices are still obtainable, and the supply ahead looks smaller. There is no change to record in the prices of Canadian hardwoods, the demand for which leaves much to be desired.

Glasgow Trade Still Quiet

Business in the local timber trade at Glasgow, continues to be far from brisk, though there is a slight indication of improvement this month. In the case of ship building requirements the demand has of late been mostly for teak and pitch pine, of which considerable sales have been reported. Inquiries for house building material are disappointing from a timber point of view. In the case of Canadian pine, the demand is still quiet, notwithstanding the fact that prices are at a more attractive level than they have been for years. The market for spruce shows little improvement, the feeling being that prices will not be maintained. Furniture woods are in moderate demand, and prices seem to be firm.—Trade and Commerce report.

Uses of Redwood

California numbers redwood (Sequoia sempervirens) as one of its most valuable assets. This wood, which is found in no other part of the world, occupies a strip of country 20 to 40 miles wide and 50 miles long in the northwestern section of California, extending a short distance over the line into Oregon. The growth is so dense and the trees so large that the supply of standing timber is estimated at approximately 75,000,000,000 feet. The redwood grows to a greater height than any other American tree, averaging on the slopes 225 feet in height and 10 feet in diameter, while on the flats under better conditions, it grows to 350 feet in height with a diameter of 20 feet. Most of the redwoods cut are from 400 to 800 years old. The oldest tree yet found began life 1,370 years ago. The redwood when normal, has a straight, slightly tapered bole, clear for more than 100 feet and a crown of horizontal branches that may occupy one-third to one-half of its total length. In a virgin redwood forest the large trees outnumber the small ones by at least 70 per cent. The average yield to the acre is about 85,000 feet.

The present production is about 550,000,000 feet annually, and allowing for the natural increase that has and will take place when the merits of this wood become widely known, there is over a century's supply in sight.

Redwood should and is now about to take the place to which it is entitled by its indisputable and varied utility. It possesses qualities which fit it for many uses. In color it shades from light cherry to dark mahogany. Its grain is unusually fine, straight and even. Its weight is light and its consistency firm but soft. It is easily worked, takes a beautiful polish and is very durable. It resists decay so well that trees which have laid 500 years in the forest have been sent to the mill and sawed into lumber. The wood is without resin; therefore it ignites slowly and offers a strong resistance to fire. The enemies of the redwood are few and it suffers from them less than other trees. It is immune from the ravages of insects, especially white ants, because of an acid element it contains and it possesses lasting qualities scarcely equalled by any other wood.

Redwood lumber, when properly seasoned, does not change; in other words, does not shrink or swell like some woods. Its use is almost unlimited. It finds a ready market for railway construction, its value in lasting qualities as a railway tie or sleeper being undisputed. Redwood ties have been known to last longer than thirty years. Architects and builders agree that the finest results can be obtained from the use of redwood either in its native or highly polished surface, and owing to this fact it finds extensive use both as an interior and exterior finish. It works easily and holds paint well. It is free from pitch and does not shrink and is adaptable to all kinds of pattern work.

Silo manufacturers are becoming converted to the use of redwood in larger numbers every year. Many water pipe lines are used in the West and redwood staves enter largely into their manufacture.

This wood is used extensively for railroad water tanks and also for wine tanks, tanners' vats, brewers' tanks, cyanide plants, acid tanks and dyeing vats. It is also used extensively for car roofing and car siding.

Redwood is difficult to ignite and when on fire burns slowly and is easily extinguished. The chief of the San Francisco fire department is authority for the statement that during his twenty-one years of experience in that city the results of his observation convince him that under similar conditions of heat exposure redwood lumber ignites less easily and burns more slowly than pine or other kinds of resinous and soft building woods with which he is familiar. He is also of the opinion that but for the fact that many buildings of frame construction in San Francisco sheathed with redwood, the burned area during the San Francisco fire would have been greatly extended.

Under the stump of a spruce tree six and one-half feet in diameter recently was found a fallen redwood tree. The rings of the spruce tree indicated that it was about 600 years old and the champions of redwood point to the fact that the redwood tree, after having lain under the spruce for 600 years, was in a sound condition.—American Lumberman.

West Indian Market for Canadian Lumber

A report upon the lumber trade of the West Indies has been sent to the Department of Trade and Commerce by Mr. E. H. S. Flood, Trade Commissioner at Barbados, in the course of which he says:

"After the opening of the Panama Canal, shippers of lumber in British Columbia will have an opportunity to compete for part of the trade of the West Indies. Up to the present time no lumber from the Pacific coast has been imported, except a small shipment of shingles which found its way into Barbados a few years ago. Interest has been expressed by dealers here on this subject, and inquiries have been made in regard to the characteristics of Douglas fir and western pine and spruce, and as to their suitability for the tropics as compared with the pine and spruce from Eastern Canada and the pitch pine now imported from the United States. To satisfy these inquiries, a request has been made to the Forestry Department of British Columbia to furnish samples of the different varieties of lumber that are commercially important and suitable for export. These samples will be shown to the trade, and afterwards sent to Trinidad, Jamaica, British Guiana and the Northern Islands. In this way an opportunity will be afforded for a comparison of British Columbia lumber with that now imported, and will stimulate the interest now taken, and assist in preparing for an early trial shipment as soon as intercourse is established through the canal.

Value of the Trade

The requirements of the British West India colonies for lumber, shingles, shooks, staves and puncheons, have an annual average value of about £40,000. The import each year has approximated very closely to this figure, the fluctuations being small. Considering the large amount, value and variety of lumber required, the trade must be therefore considered as a steady one. These colonies, with the exception of Jamaica, give a preference to Canadian lumber.

Of the foreign colonies of the Caribbean that do not give a preference to Canada, or that have a preferential arrangement with other countries, the largest importer of lumber is Cuba, the annual value of whose import is about £800,000. The next in importance is Porto Rico whose import amounts to upwards of £400,000. The import into both these islands is of the same general character and variety as that in the British West Indies. The whole of the West Indies, British as well as foreign, have therefore a total import of lumber of over a million and a half sterling, of which Canada is supplying under £200,000. It is apparent therefore that British Columbia would have a large territory to exploit, provided the quality of its lumber was suited to the needs of these countries.

Present Prices of Lumber c.i.f. in the West Indies

Advices as to the prices of Nova Scotia pine are to the effect that cargoes are now on the way to Barbados at $25.50 c.i.f. for merchantable, and $20.50 for second quality. Recent quotations for pitch pine place the price at $29 to $31 c.i.f. according to widths and lengths. Scantling at $2 less per M. The price of this lumber varies considerably from time to time, and at the beginning of the year prices were for—

All heart pitch pine, 1 x 12	$38.00 c.i.f.
All heart pitch pine, 1 x 10	35.00 c.i.f.
Scantling, all heart	32.00 c.i.f.
Flooring boards, all heart	$30.00 to 32.00 c.i.f.

These high prices were due to the freight rates ruling at the time which have since declined, and the market price of lumber has dropped. Cargoes of spruce of merchantable quality are now quoted at $21 per M. c.i.f.

Staves and Shooks

Staves, shooks and puncheons, taken together, are among the largest items of import, and efforts have been made in the past with apparently some success, to induce Canadian firms in the Eastern Provinces to compete for a share of the trade. At present, nearly all of it is in the hands of the United States. As there is an area in British Columbia that produces oak timber suitable for making staves, it may be well to refer to this industry. The staves that are supplied by the United States are made of oak wood, one inch in thickness, and supplied in the rough. The length of the stave is 44 inches, and the width varies from 2½ to 4½ inches. They are trimmed at the end, grooved, and slightly bent. Thirty of these make a pack, which is sufficient to make a puncheon. There are about 30 superficial feet of oak in each pack. These packs are supplied c.i.f. for a price which varies from $1.85 to $2.05, depending on freights."

Barbados Market Report

S. P. Musson, Son & Company, Barbados, report under date of July 9th as follows:—

Lumberstuffs.—White pine—The Trn. Schr. "Eddie Theirault" arrived on the 26th ult. from Ingram Port, N.S., with 184 m. ft. which had been sold to arrive at $32 for merchantable, and $24.50 for second quality. The 84 m. ft. ex Trn. Schr. "Jeanie A. Pickles" mentioned in our last was sold at $32 and $25 respectively. Spruce.—The Trn. Schr. "Rosalie Belliveau" arrived on the 4th inst. from Belliveau Cove, to our address, with 266 m. ft. which we had sold to arrive at $26.50 for merchantable. Dealers are fairly well supplied for the present. Pitch pine.—No receipts, but supplies are sufficient for present requirements. Shingles.—The only arrival is a cargo of 1,040,000 extra No. 1, ex Schr. "W. C. Silver" which had been sold to arrive sometime ago at $2.55. The lot of 400,000 mentioned in our last, has been disposed of at $2.65. No receipts of Long Gaspe. Shooks.—No arrivals. Wood Hoops.—No receipts.

Annual Consumption of Wood in the United States

Statistics have been compiled by the United States Forest Service which show for the first time precisely how the lumber produced in the country is utilized. About 45 billion feet of lumber of all kinds is the annual production in the United States; of this nearly 25 billion feet, board measure, are further manufactured, the other portion remaining for rough construction lumber and for similar purposes. This is exclusive of that material which reaches its final use in the form of fuel, railroad ties, posts, poles, pulpwood, cooperage,

MONTREAL. July 3rd/14.

Messrs, Canada Lumbermen & Woodworker.
Montreal Que.

Gentlemen:-

Just a line to let you know that I am more than pleased with my advertisement for "OLD TOWN CANOES" in the Canada Lumbermen & Woodworker. My advertisement only commenced in the May 1st. issue, and I find the results exceedingly gratifying, having already received many mail orders, as well as telegraph orders.

I have always been told that the Canada Lumbermen and Woodworker was an exceptionally high-class medium and I am glad to be able to endorse the paper personally as a splendid periodical through which to reach the lumber trade of this country.

Yours very truly.

FMD/R.

F. M. Dixon

Put your "ad" in the *Canada Lumberman and Woodworker.*

IT BRINGS RESULTS

wood distillates, and the barks and extracts demanded by the tanning industry.

Nearly or quite 100 different woods are used in the United States under their own names, while an unknown number find their way to shops and factories without being identified or separately listed, except under general names. In quantity the softwoods, the needle-leaf or coniferous trees are most important, but there is a greater number of species among the hardwoods, or broad-leaf trees.

More than one-half of the total consists of planing mill products, the largest items of which are flooring, siding, ceiling and finishing. The next industry, in point of quantity used, is the manufacture of boxes and crates. Nearly four times as much wood is demanded by makers of boxes and crates as by the builders of steam and electric cars, which come next, and almost five-fold the amount that goes into furniture, which, in turn, leads vehicle manufacture. Vehicles demand surprisingly large supplies of wood, and much of it must be of a high-class in order to meet requirements for frames, gears, and bodies.

The Human Side of Factory Operation

Although most woodworkers operating large factories and handling large bodies of men realize that the human problem which confronts them is just as difficult as, and much more vital than, the mechanical problems involved in the operation of machines, and the manufacture of raw material into the finished product, it is still true that the human factor is not always given the attention which it deserves, says G. D. Crain, in the Wood-Worker, Indianapolis. The efficiency movement, though ridiculed by some and overpraised by others, undoubtedly has accomplished much good in calling attention to this particular phase of manufacturing. Labor has always been taken for granted. Labor started manufacturing without tools, and as equipment grew better and better, and master and man drifted farther apart through the multiplication of processes and the establishment of larger manufacturing units, the tendency grew to consider the workman rather in connection with the machine than the machine in connection with the workman.

While plants are laid out largely along mechanical lines, and while it is accepted that the top-notch of efficiency cannot be reached unless the machinery is all that it should be, it does not do to conclude that the installation of a high-priced machine is going to solve every problem, unless the right man to handle that machine has been secured, and unless each man is working with, instead of merely at, his machine. Don't take the workman for granted; study him, along with the equipment he must use; only in that way will both deliver the best results.

Attention is sometines called to the difficulties attendant upon the operation of cost systems. It is explained that the men fail to show the proper spirit of co-operation, and instead of making it easy to handle the system they seem to put every obstacle in its way. In some cases it is thrown out without really receiving a fair trial, the manufacturer going back to the old way of estimating, by taking gross costs and doing without costs covering each specific factor involved in the manufacturing operation.

There is only one explanation for this, and that is that the men were not considered when the cost system was discussed; they were again merely taken for granted. Of course, they are being paid by the concern to run the machines, and taking part in the operation to the extent of noting the time required for each kind of work and the amount of material used in each job would not add greatly to their labors. But that doesn't cover the situation fully, by any means.

The employer and employee are working together. They have a mutual object—making a living. The owner of the plant has staked his capital as well as his labor in the business, and failure to succeed means the loss of capital as well as time. The workman who gets his wages from the company is thereby able to pay his living expenses and raise his family in comfort. Both of them find in the continuous and profitable operation of the plant advantages and benefits which can hardly be measured. Therefore it is to the interest of both that they work together to develop the best possible method of conducting the business.

If an explanation along this line were made to the men at the time the cost system was put in there would be comparatively little objection to it. In too many cases, however, the announcement is simply made that each man must make a report covering in detail his day's work. He is given the proper blanks to fill out, and if he does not do so he is considered as not doing his full duty.

From his side of the fence, however, he looks at it as a kind of imposition; or worse, as a reflection upon his ability and integrity as a workman. This is something that some manufacturer fail to take into account; pride of workmanship. The skilled artisan who knows that he does his work well and who works for pleasure of creation entirely apart from the wage connected with it, feels, unless a proper explanation is given, that to check up his work by means of a cost system is to suggest that he has not been giving a full measure of effort and that the company is not altogether satisfied with the results of his toil.

There is no intention to give offense in this way, but that offense is sometimes taken there is no doubt. "They want to see if we've been soldiering," is sometimes the sneering comment which is heard when a cost systen of this kind is put into use without getting the moral support of the workmen. Resentment grows, and, not being eliminated by the simple explanation of why the plan was adopted, it gets the sort of reception which, in many cases, results in the plan being considered a failure, when, in fact, it was not really given the proper kind of trial.

A preliminary to any radical innovation of this kind, which could not possibly be misconstrued, would be to explain the purpose of the system; to show that every man would get credit for good work, whereas under the old system it is sometimes impossible to know who is giving the best results, and that those who turned out the best work could be sure of getting increased pay. If these and other obvious benefits from the standpoint of the workman, growing out of the use of a modern cost system, were explained, there would be no trouble about getting the co-operation of the men in the factory. In other words, study the human factor as well as the mathematical quantities involved.

Every workman who does his best to operate his machine properly and to earn the money he finds in his pay envelope on Saturday night would, at first blush, feel resentment at the harsh criticism of a superior. It is the natural thing for a rebuke which the recipient feels is not entirely merited, to have exactly the opposite effect from that intended. Hence the careless or rough foreman, who is looking only at the work and doesn't see the man, is likely to cause more trouble through an ill-timed criticism or a brusque comment than he has any conception of.

Foremen who get the best results are those who have the esteem and respect of their men; and they cannot secure this if they are constantly nagging their men or if they make their suggestions and criticisms in any way but a kindly one. "Bawling out" a man before his fellows, no matter how well-deserved the correction, is not going to do any body any good. It may give the foreman a little elation, as some men in similar positions love to exercise their authority and make the men under them feel "cheap;" but if the good of the factory is to be considered, it must be conceded that this is not the way to protect it.

By far the better plan is to approach a workman quietly, and, without raising the voice or showing feeling of any kind, point out the defect in the work, or take the machine and demonstrate just how it is to be done. Shouting angrily at the workman can only be expected to arouse anger on his part, so that instead of his considering the criticism judicially, he simply nurses his resentment and thinks of a possible opportunity to exhibit it in the most effective way possible.

The foreman of the mailing department of a big box factory in the middle west, who has under him, for the nost part, young men from eighteen to twenty years of age, is almost idolized by the lads, because, as they say, "he never gets mad." On the other hand, he is constantly cheering them on to better work by a timely word of praise or suggestion. He never criticises merely for the sake of finding fault, but always for the good of the man and the factory. And the beauty about it is that he makes them see it. He considers them as well as himself and the company, and doesn't let his duty to his employer interfere with his duty to the men. For that reason his department is about the best run in the factory, and there is never any trouble about the character of the work.

Discipline in the factory is, of course, a major element of the human factor. The superintendent should be supreme, yet each foreman should have complete authority in his own domain. The owner who seeks to interfere in the conduct of the manufacturing department, and to reduce the authority of his superintendent, is forgetting the fact that the superintendent is hired to look after that and is responsible for results, and that, if he is not given full sway, he cannot be expected to stand responsible for the success or failure of his department. So in connection with each department. The superintendent should not go over the foreman's head to deal with a workman, but the proper heads should be consulted, to the end that the factory shall recognize the divisions of authority and shall respect the discipline that has been established.

By giving attention to the human element and studying it just as carefully as the mechanical features, most owners of woodworking plants can raise the efficiency of their factories to a considerable degree.

A new means of transporting western lumber, grain and coal is planned in the survey of the Saskatchewan River, to be completed this fall by the public works department. The work has been going on for three years and the idea is to have a 5-foot waterway from the Rockies to Winnipeg. This would be sufficient for barge traffic. The cost is roughly estimated at $15,000,000 and would be reduced by valuable horsepowers to be developed along the route.

SUPPLIES

With apples scarce as hens' teeth and mostly poor at that you had better try the plan which a great many lumbermen have adopted of using in the camps, California Peaches, Selected Valencia Raisins and Prunes. We have some specials in these lines and here they are:

California Evaporated Peaches in 50 lb. boxes	7½
4 Crown Selected Valencia Raisins	6⅞
Oregon Italian Prunes 80/90 in bags 90 lb.	7½
Oregon Italian Prunes 70/80 in bags 90 lb.	8½

A Lumber Piling and Unpiling Machine

A Hilke 30 ft. PILER working in the yard of the Shevlin-Clarke Co., Limited, Fort Francis, Ontario.

This machine will pay for itself from one to six times per annum, all depending on the scope of its opportunities.

It reduces by half your cost of piling and unpiling lumber.

It saves half your cost of alley floors or roads.

It reduces by half your number of pile bases.

It cuts squarely in two your costs of roofing lumber.

It saves just half your yard space and this always means much even where land is very cheap, because it costs money and lots of it to haul lumber round a yard.

It takes lumber down from high or low piles with perfect freedom from breakage or injury.

It sets the pace for your men and helps them do much work with little labor.

It is as mobile as the men who operate it and when placed in front of a pile is instantly ready for work.

It removes at once and forever the need of using elevated tramways with their great first cost, impaired circulation and imperfect drying below their surface.

It is a maker for efficiency because it is itself so efficient that it naturally turns your mind toward other yard economies of which there are usually many never before observed.

Patented in the United States and Canada by H. C. Hilke.

OPPORTUNITIES

WE own and offer for sale on attractive terms a few especially well selected tracts of timber running from 50 million to one billion feet that are ready for immediate operation, having a good local demand at high prices.

The timber on the Pacific Coast is the last stand of the great forests. Well selected timber in British Columbia is the best investment on this Continent and offers especially attractive inducements for manufacturers.

EDGINGS

Ontario

The Riordon Pulp and Paper Company are installing a drying machine at their Hawkesbury mill. The machine will have a capacity of 35 tons per day.

The logs of the Cleveland-Sarnia Saw Mills Limited are now coming in fast from the north, both by water and by rail and the mill is sawing at the rate of about 35,000 feet per day.

A small portable sawmill, operated by H. Monteith, about three miles out of Parry Sound, Ont., was destroyed by fire recently. Mr. Monteith is putting in a new mill to cut out the balance of his stock.

The sawmill belonging to Schultz Bros. & Company, Limited, Albion Street, Brantford, Ont., was recently destroyed by fire. The loss amounted to $5,000, which was covered by insurance. Some of the machinery was also destroyed.

The log drives of the Peterboro Lumber Company, Peterboro, Ont., which have been held back by low water, causing the mill to shut down for about ten days, commenced arriving about the middle of July and enabled the company to commence operations again. The drive for the mill of the Estate of Alfred McDonald, was reported to be coming out immediately behind those of the Peterboro Lumber Company.

A general meeting of the first mortgage bondholders of the Upper Fraser Lumber Company, Limited, will be held at the office of the company, 526 Board of Trade Building, Montreal, on August 3rd, for the purpose of considering a transfer of all the mortgage premises to Timber Properties and Securities Limited, for a consideration of $1,660,000 par value of preferred shares and $570,000 par value of common shares of the Upper Fraser Lumber Company, Limited.

Eastern Canada

The Harbor Commissioners of Montreal have awarded a contract for oak timbers to James Shepherd & Sons, Sorel, P.Q.

R. & T. Ritchie, Aylmer, P.Q., whose large sawmill was recently destroyed by fire, are actively engaged in rebuilding the mill. The new buildings will probably be completed by the end of December and will cost about $50,000.

The International Freehold Pulp Wood Company, Limited, has been incorporated with capital of $50,000, with head office at New Carlisle, Que. The provisional directors are J. S. Gordon and J. B. S. Mitchell, both of New Carlisle, Que.

A commencement has been made with the construction of the pulp mill of the Bathurst Lumber Company, Bathurst, N.B. The mill will be electrically lighted and driven, and contracts have been placed for two 1500 kw. turbo-generator sets and also for boilers.

A large quantity of pulp was destroyed by a rfiie which occurred at the yard of the Gres Falls Company, Cap Magdeleine, P.Q., on July 20. At one time the fire threatened the mills. The fire was discovered in the afternoon and as the municipality was not equipped for combatting such an outbreak, an engine and men of the Three Rivers brigade rendered help. A message from Three Rivers states that practically the nntire pile of pulp was burned.

The sawmill of the Louison Lumber Company, Limited, at Jacquet River, N.B., was recently destroyed by fire. They report that they carried insurance to the extent of $40,000, which partly covered the loss. The equipment consisted of a twin slabber, 48-in. Wickes stock gate, circular saw, two edgers, and a full outfit of lath machines, slashers, trimmers, etc. The new mill will be equipped with a band mill of the same capacity. Construction will be commenced as soon as the company have their plans completed. They expect to commence sawing again in September.

A report from Truro, N.S., states that the Maritime Lumber Company, composed of British capitalists, which took over the Alfred Dickie lumber properties some time ago, is now in financial difficulty, and that its assets are being offered for sale at the suit of the Eastern Trust Company, in connection with foreclosing a mortgage given to the Royal Bank for money advanced. The timber areas embrace 300,000 acres of pine, spruce and hemlock, and are estimated to contain 600,000,000 feet of lumber. The company is said to have invested $300,000 in the venture, and stocks and bond liabilities are reported as amounting to $4,800,000.

Some extensive alterations are being made at the mills of the Laurentide Company, Grand'Mere, P.Q. The company have under construction an immense hydro-electric plant on the St. Maurice River, which will give about 60,000 horse power, and, in addition, are carrying out improvements to their sawmills and pulp equipment. An all steel log conveyor, 175 feet high, running from the sawmill, has been put into operation, and while the site for a new mechanical pulp mill is being excavated. This will be equipped with German grinders of a new type, about three times the size of the present type, the grinders being electrically driven. A new sawmill is also projected.

The Nouvelle Lumber Company, which recently purchased the mill and limits of Chappell Bros. in Bonaventure County, P.Q., has been incorporated under the laws of the State of Massachusetts. Their capital is $500,000 in preferred stock, and no bonds. The directors of the company are not all chosen, but are at present as follows—Chas. H. Fish, Boston, president; Arthur B. Silsbee, Boston, treasurer; C. H. Fish, A. B. Silsbee, Geo. C. Scott, R. S. Warner and W. C. Fish, directors. The property consists of 132,000 acres in Bonaventure County, with a mill located at St. Omer, P.Q. The company intend to enlarge or rebuild the mill in the near future, and to improve the property in many ways. Operations were commenced last spring, being a continuation of the operations of Chappell Bros., the former owners.

Western Canada

The Caledonian Saw Mills, Limited, have been incorporated with a capital of $25,000, with head office at Calgary, Alta.

W. G. Scrim Lumber Company, Limited, has been incorporated with a capital of $50,000, with head office at Vancouver, B.C.

Skeena River Mills, Limited, have been incorporated with a capital of $250,000, with head office at Vancouver, B.C., to carry on business as lumber operators, etc.

Fire recently completely destroyed the mill of the New Ladysmith Lumber Company, at Nanaimo, B.C. entailing a loss estimated at $30,000, fully covered by insurance.

Powell Lake Mill Company, Limited, have been incorporated with a capital of $40,000, with head office at Vancouver, B.C., to carry on business as manufacturers of lumber.

It is reported that, as a result of a visit to Victoria, B.C., by Mr. J. Langley, representing New York capitalists, the Victoria mills of the Canadian Puget Sound Lumber Company will soon be re-opened.

Watt & Gibson, North Regina, Sask., are contemplating the erection of a planing mill to cost $15,000. Their address is care Capital Investment Company, 1818 Cornwall Street. Their head office is located at Toronto.

Plans have been drawn for a pulp and paper mill to cost $150,000, at Winnipeg, Man., for the Dunlop Pulp & Paper Mills, Limited, 316½ Donald Street. It is possible that construction work will be started this summer.

A meeting of the bondholders of the Swanson Bay Forests Wood-Pulp and Lumber Mills is to be held in London, England on August 12th for the purpose of considering extraordinary resolutions for the sale of the company's properties.

It is reported that the British Canadian Lumber Corporation, Vancouver, B.C., have closed a deal for the sale of their largest mill. The price mentioned is $1,000,000 and it is also reported that the company intend to sell their other mills.

The White Pine Lumber Company, Spokane, Wash., are contemplating the erection of a sawmill near Westbridge, B.C., about thirty miles from Greenwood. The mill will have a capacity of 200,000 feet of lumber every twenty-four hours.

H. R. Godday & Company, Limited, have been incorporated with a capital of $250,000, with head office at Quebec, to carry on business as lumber merchants. The provisional directors are A. C. M. Thompson, advocate, and W. A. Godday, both of Quebec.

Sealed tenders are being received by the Minister of Lands of British Columbia, up to noon, August 7, for the purchase of a license to cut 875,000 feet of timber located at Deepwater Bay, Valdez Island, Sayward district. Three years will be allowed for the removal of the timber.

An application has been received by the British Columbia Forest Branch from the B. C. Sulphite Fibre Company, of Howe Sound, to purchase 200,000,000 feet of timber, hemlock and spruce. This company manufactures about fifty tons of sulphide per day, most of which is shipped to the United States and Japan.

The sawmill belonging to the Salmon River Lumber & Shingle Company, Limited, 198 Hastings Street West, Vancouver, B.C., was recently destroyed by fire. The mill, which was located on the B. C. E. Fraser Valley line, will be rebuilt in the near future. The loss was about $40,000. The manager of the mill is Mr. P. Sills.

The Empire Lumber Company is rapidly developing its property in the neighborhood of Cowichan Lake, B.C. A tug has been constructed for service in connection with the company's logging camps. Two new yard engines have also been secured. It is expected that the daily output will now be between thirty-five and forty cars.

Death of a Pioneer Beamsville Lumberman

Mr. Cyrus Russ, a pioneer of Beamsville, Ont., died recently at the house of his son at Woodstock, Ont., where for about two years he and his wife had resided. The late Mr. Russ was born in North Grimsby, 87 years ago. When a young man he went into the lumber business, which he conducted for upwards of 25 years, running a saw mill on the mountain. In 1890 he moved to Beamsville where he went into the implement business, which he conducted for nine or ten years, running a saw and planing mill in connection. Up to some five or six years ago he continued in the lumber business. Mr. Russ was always interested in municipal affairs and was a member of the Grimsby township council in the earlier days. Some two years ago he sold his property at Beamsville and went to live in Woodstock, with his son.

Studying Reproduction Cut-Over Areas

Dr. C. D. Howe, a member of the staff of experts employed by the Canadian Commission of Conservation is in Victoria, B.C., making arrangements for a study of natural reproduction in British Columbia forest areas, where logging operations have taken place, or where forest fires have occurred during the season. Dr. Howe who is also a member of the staff of the University of Toronto, School of Forestry, will make Victoria his headquarters while engaged in this work. At present he is making a study of the area upon which Shawinigan Lake Lumber Company has been operated for the past four years. Subsequently he will study the district of Chemainus, where the Victoria Lumber Company have been operating for twenty-four years. The result of his study will be published subsequently.

Belts for Grueling Sawmill Work

When a big log is slammed up against the saw, right then and there is a mighty strain on the belt.

If the belt slips, power is lost. If the belt breaks it means a costly shut-down, money lost through idle hands and loss of output.

That's why the best belting is imperative in the sawmill. That's why buyers of belting should buy Goodyear belts made for unusual service rather than belts made on a price basis. After all, a belt is only a vehicle of service, and if the service suffers that means good money lost.

For sawmills there are Goodyear belts that cover every exact requirement, from the main drive to high speed small pulley machines.

"Extra Power"

For the main drive—edger and planer. Wonderfully strong. This belt shows the highest friction pull of any we have ever tested. Made of the heaviest and strongest duck of any belt we make—laboratory inspected and tested. The stretch taken out in the making. Highest grade rubber friction unifies the strong serviceable plies. Absolutely no ply separation. Made in various widths—"endless" when desired.

"Imperial"

Designed especially for high-speed and small pulley conditions. A fine belt for trimmer work.

How to Buy

Buy equipment on a service basis. Remember that back of every Goodyear product is fifteen years' experience in this field.

Every Goodyear belt is made to set a standard, not to meet a standard.

At the Canadian Goodyear Factory are employed experts who study and approve actual working conditions before any piece of Goodyear equipment is made. That is why every Goodyear product is a service product.

At this same Factory are employed the same methods and quality standards that have won Goodyear the leadership in tires.

Consult Goodyear experts before you buy hose, packing and valves. Buying this way you buy from a service standpoint. And you know that service rendered is always most economical in the long run.

Ask Goodyear to tell you just what product for the very purpose, and why. Costs nothing to ask questions. Involves no obligation. Write today.

RUBBER GOODS FOR LUMBERMEN

Belting Our long experience in the making of Rubber Belts enables us to specialize on this line. "Monarch," "Red Strip" and "Lion" are our leading brands for power transmission. (Write for Booklet B-1.)

Packings "Redstone" High Pressure Sheet Packing has proved by test that it will outlast any other similar packing on the market. We make Spiral and Ring Packings, etc., that are equally reliable. (Booklet P-1.)

Hose for Steam, Water, etc., etc., in various grades, made especially to give satisfactory and economical service under different conditions. (Booklet H-1.)

Fire Hose One or more of our twenty brands of Fire Hose will be found, not only in the best equipped Factories, Mills, etc., but in almost every Fire Department in the Dominion. (Booklet H-1.)

—SHIMER—
Labor and Time-Saving Tools

POPULAR MATCHING HEADS

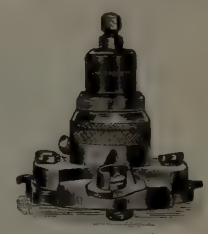

Fig. 202

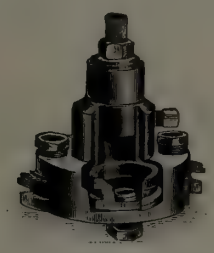
Figs. 202 and 203 are leading tools for matching Flooring, Ceiling, etc., for feeds up to 130 lineal feet per minute. They are made with four, six or eight Bits to each Head according to the machine to be used upon, material to be worked, and the rate of feed desired.

Price, per set, with 4 Bits to each Head, $40.95
" " " 6 " " " 49.27
" " " 8 " " " 57.60



DOUBLE CEILING HEADS

The Shimer Cutter Heads for matching Ceiling in double thickness to be re-sawed into two marketable strips, will double the capacity of any matcher or moulder.

These tools are very complete and are giving satisfaction in a large number of mills.

Price, per set, complete, only $40.94.

These tools are turned out of Solid Steel Forgings—have the Shimer "make-ready" which saves you all the fitting and trying—keep your work up to the standard.

"Wilson Bros." Hardwood Flooring

is the Flooring that is manufactured expressly to supply the demand for the best. It is made by modern machinery from carefully selected stock, and every precaution is taken throughout our entire system to make it fulfill the requirements in every particular. Write us for prices.

Wilson Bros., Limited - Collingwood, Ont.

The Three Goodhue Belts

"EXTRA" "STANDARD" "ACME WATERPROOF"

These three brands are made for three different services and each brand is the best quality made from selected hides with the stretch taken out.

"Goodhue Belts" stretch less than any other belt by 15 to 25 per cent. This quality effects a great saving because it is unnecessary to be continually shortening the belt to keep it taut.

"Acme Waterproof" brand is made for the wet places in a mill and will give a remarkable service under the most trying conditions.

When you buy a belt—buy a Goodhue. Prices and particulars on request.

Disston Cross-Cut Saws

They are ground to a true taper by the special, and exclusively Disston, grinding process. Being ground on lines that conform exactly to the breast of the saw, the blade is absolutely uniform in thickness throughout the entire length of the cutting edge. This special method of grinding gives the maximum amount of clearance without sacrificing elasticity and stiffness. Any man accustomed to a cross-cut saw knows what that means.

And only Disston Crucible Steel is used. This steel combines the hardness and toughness that produces the wonderful edge—and set-holding qualities for which Disston Cross-cut Saws have long been famous.

Send for our Cross-cut Saw Booklet—free for the asking. It is the finest book of the kind ever published.

Henry Disston & Sons, Limited

Keystone Saw, Tool, Steel and File Works **TORONTO, CANADA**

Branch at Vancouver, B. C.

"The Saw With a Temper"

Size "S" Single Mill with 16-foot Carriage

Size Husk	3 feet by 6 feet 3 inches	Width of Carriages	33 inches
Diameter and Length Mandrel	2 3/16 by 55 inches	Trucks	7-inch wheels and 1¼ inch axles
Size Drive Pulley	20 by 10 inches	Length Track	32, 40, 48 or 56 feet
Feed per Revolution of Saw	0 to 3¼ inches	Style and Opening of Blocks	Cl-36 inches
Feed Belt	4-inch Gandy	Style Mill Dogs	Pony Excelsior
Largest Diameter Saw	56 inches	Style Set Works	No. 1 Single Ratchet
Length of Carriages	12, 16, 20 or 24 feet		

With each complete size "S" mill we furnish one saw, wrench, cant hook, feed belt, pulley with boxes for tightener and foundation bolts for husk.

Knight

Pony Lath Mill

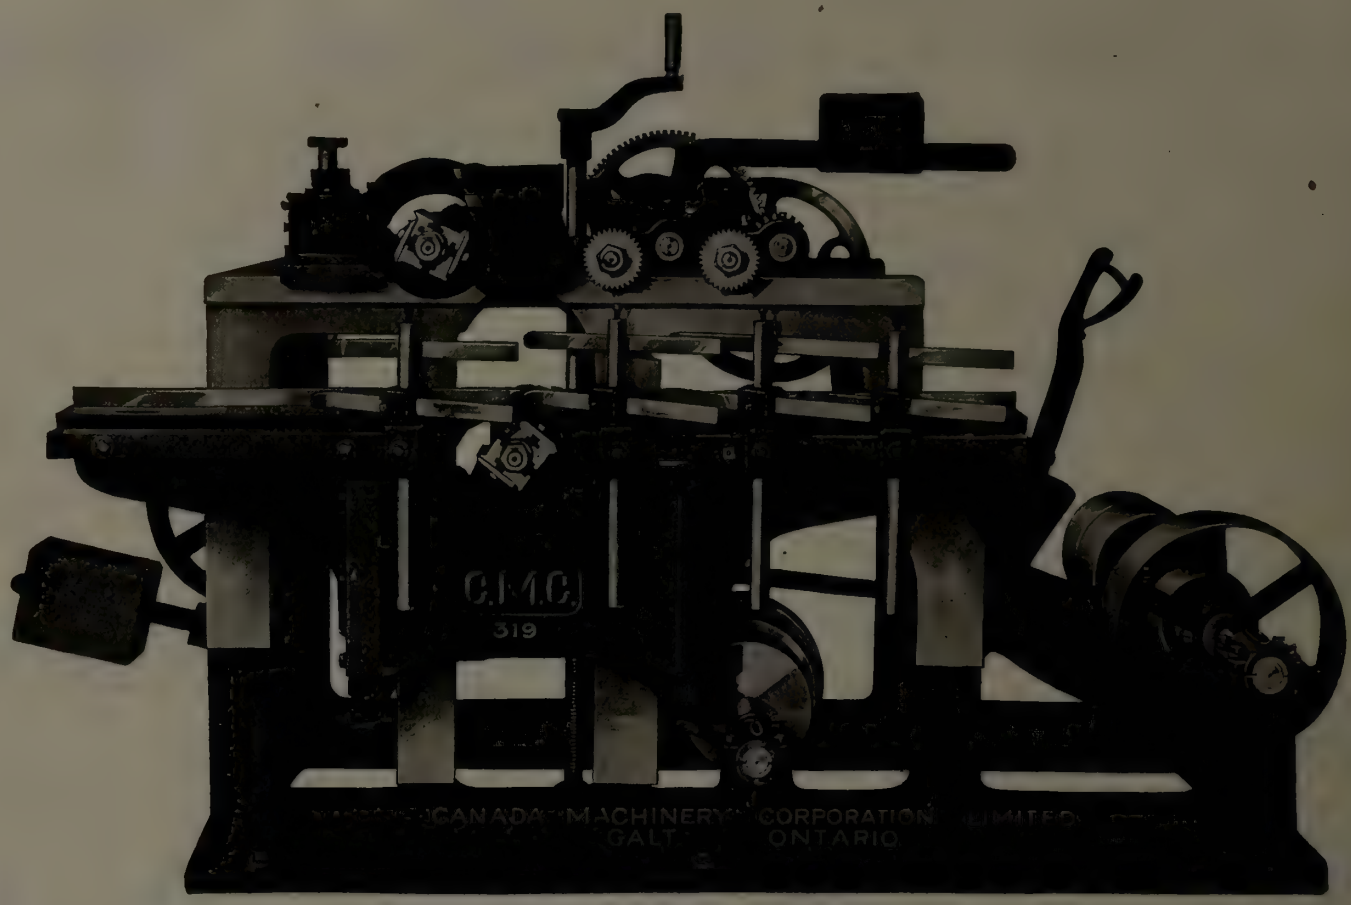
This mill is built for use with a 10 to 15 horse power engine and as single mill only. It is specially suited to the requirements of thresher and saw mill men operating in small tracts of timber, as both husk and carriage are of a size which will permit of easy loading between the standards of a wagon when moving from one setting to another.

Write for the catalogue of the Knight line of saw mill machinery.

THE KNIGHT MFG. CO., Canton, Ohio.

Canadian Distributors:—R. Hamilton & Co., Vancouver, B. C.. E. Long Mfg. Co., Orillia, Ont.

DOOR C.M.C. STICKER



No. 319 Double Door Sticker

Designed for sticking both edges of stiles and rails for doors and sash at one operation.

The feed rolls are made to swivel on the frame, a new "C.M.C." feature that meets with the approval of practical millmen. This arrangement enables the operator to adjust the lead of the rolls to suit the quality of the material, thus overcoming the difficulty often experienced with machines of this class.

Three rates of speed can be obtained, and the change made from one rate to another without stopping the machine, thus saving considerable time.

It will take stock from 2½ inches to 15 inches wide and up to 4 inches thick.

Descriptive Bulletins on Request.

DIXON'S Silica-Graphite PAINT

Protect your machinery and equipment exposed to the weather with a coating of this highly resistant paint—quite rust-proof, heat-proof, water-proof, fume-proof. A single application will outlast several coats of ordinary paint, because of the solid protective veneer of silica-graphite which is practically a part of the metal. Send for "Silica - Graphite Paint," Booklet No. 238-B.

Would it not be better to buy a package of Cling-Surface than expensive apparatus like this?

This 1000-pound Tightener Lost Its Job After the Belt was Treated with Cling-Surface

Many users of belts have the mistaken idea that tighteners are always necessary on short drives where one pulley is small and the other large.

This photograph shows a 1,000-lb. tightener in the New York Aqueduct Construction Plant near Yonkers, N.Y., that was so used on an old and oily 30-in. leather air compressor belt. But, the tightener did not prevent slip.

It is very difficult to make hard belts pull heavy loads without slip. The too frequent proceeding, as in the above case, is to increase belt tensions in one way or other. The high tension method is **wrong.** This the Yonkers people learned after starting Cling-Surface treatment over a year ago. The tightener rapidly became superfluous for the belt stopped slipping and it now runs with a sag of 13 inches.

Invariably belts treated in accordance with our directions can be run slack or easy without excessive tension, just as in the example cited above.

Write us details about your belts and your troubles, and we will tell you just how to proceed to effect maximum economy. Or, at least, write at once for further information if you care for better belt service. We quote f.o.b. Toronto.

Cling-Surface Co

I would rather stroke a bird's wings than woman's hair.
And the fragrance of the rose pressed against my lips
Is sweeter and more sincere than woman's kisses.
—El-Rami.

Those Who Have Read:

"The Soul of Lillith," written by Marie Corelli, no doubt have been struck by the cynical expressions of El-Rami as to women's constancy. Throughout the whole novel there is a tone of doubt of women in general, though in discussion with Feraz, his brother, he admits there are clever women and faithful women; but further states: "we men seldom choose them, we are fools and we pay for our folly."

There is No Doubt of the high quality of the goods we manufacture, **The High Quality is Constant.**

Take for instance

Harris Heavy Pressure

"the babbitt metal without a fault."

We have spent years in experimenting in our chemical laboratory to produce a babbitt metal which would fill the bill in 95 cases out of 100 where genuine babbitt is used and our sales, which are increasing most rapidly, give evidence that the quality is constant and the metal reliable.

Engineers know that H.H.P. is built for service.
H.H.P. is the best babbitt metal for all general machinery bearings.
H.H.P. will not crack or squeeze out.
H.H.P. runs cool at any speed.
H.H.P. is copper-coated and copper-hardened.

Our reputation and guarantee is back of every pound

Loans on Timber Lands

For Long Periods of Time in Amounts from $25,000 and up

We have been in the lumber business for over half a century.

We now control and operate a number of mills. We also loan money to lumbermen.

It will be to your advantage to deal with practical men who know the requirements of the lumber trade all over Canada.

Our business is to know the wants of the lumbermen and to meet them.

Ontario Bond Corporation of Canada, Limited

HAMILTON, ONTARIO

The reputation of the Johns-Manville Company will bring you a bigger roofing business and profit.

Roofing buyers everywhere are awaking to the fact that of even more importance than the quality of roofing itself is the company that stands behind it.

J-M Asbestos Roofing and J-M Regal Roofing are built to give the kind of service that will insure a customer's goodwill and hold his patronage.

But, more than that—J-M Branches—located within a convenient distance of anywhere—invariably stand ready to make that promise good.

To sell J-M Asbestos Roofing and J-M Regal Roofing is to place yourself above competition—to get the exclusive trade of those who realize that real economy is not determined by first cost, but by service.

Write nearest branch for our special dealer proposition.

Good Lumber HORSES

Should be free from all blemishes

Use **ABSORBINE** for Wind Puff' Capped Elbow, Bog Spavin, Thoroughpin, Shoe Boil, Curb, Enlarged Glands and all puffs and swellings, Fistulla, Poll Evil, Sprains, Contracted Tendons, Bruises, Lameness of all kinds.

ANTISEPTIC

You cannot get good work out of your lumber horses if they are lame, blemished, sore, sick or similarly unfit.
The animal with Swellings, Soft Bunches, Bog Spavins or any such blemish, whether lame or not, needs your attention.

ABSORBINE

best friend—it relieves the horse of all pain, soreness and troublesome blemish. It makes the horse better looking, better working, more fit and of greater value to you.
You can work your horse at the same time. This is no new lotion but the tried and tested remedy of many years successful use.
Thousands upon thousands of horses which would have been ailing and sick and unsightly have been made fit and well—good workers and good lookers. What others have done with Absorbine you can do, too.
All enquiries on special cases answered without delay—full information and instruction on request.
Absorbine $2.00 a bottle at druggists or delivered.

Manufactured only by

ABSORBINE

does not blister or remove the hair, never leaves scars or blemishes of any kind.

It is easy to apply and does not require the horse to be laid up.

Highly concentrated and only a few drops required at each application.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Department of the Interior, Ottawa,
December 20th, 1912.

Deputy Minister.

Waterous Boilers

Are Best For Sawmill Use

Waterous Return Tubular Boilers, both Stationary and Portable, are especially suitable for sawmill work. They combine economy in fuel consumption, ease and convenience in operation, with absolute trustworthiness.

"Safety First" is not new as applied to these Boilers—it has been the idea behind every detail in their design and construction for fifty years and more. Exceptional care—exceeding the requirements of ordinary provincial boiler building regulations—has been consistently exercised in the selection of the materials and in every operation of their building.

Let the next boiler you buy be a "Waterous"

Humboldt Redwood

The largest and most costly passenger steamer on inland waters of the world.

ILLUSTRATED is the "Seeandbee," the largest sidewheel steamer in the world. All the decks, staterooms, partitions, etc., of this floating palace are built of beautifully figured Humboldt Redwood.

This is a striking example of the use of this wood. It is also unequalled for all out-of-door construction because of its weatherproof qualities.

Humboldt Redwood is free from pitch, fire-repelling, easily worked, takes a mahogany finish, and will not rot, check or be attacked by vermin.

Canadian Representative: Gilbert B. Woodhull

"Lumber of a Kind That Will Sell"

That characterization of

ARKANSAS SOFT PINE

was made by a dealer who bought it because he needed lumber that would enable him to build up his business in the face of strong competition.

Here are other of the very remarkable statements he makes regarding **the kind of lumber it pays to buy and to sell:**

...and we do this without handling coal ... other side line. I know what kind of adver... pulls strongest with me, and I try to make mine pull in the same way. I got in the first car of Arkansas pine that ever came into this part of New England, and I did that because of the good, straightforward advertising that those people did in the AMERICAN LUMBERMAN. It seemed to me from their ad that they were good people to deal with and that the lumber was of a kind that would sell well here. Both of these things proved to be true. When the first car came in I took pains to send a little of it out to each of the contractors who were doing business with me, telling them what it was, of course. That's all the introduction it needed.

"Of course where bills are figured so widely the... very little of the old association idea of the d... of trade. If two towns are ten miles apa... don't divide up the business so tha... ve miles f... is...

—From American Lumberman, page 34, July 18, 1914.

Are you "sending **Arkansas Soft Pine** to the contractors with whom you are doing business" and are you "telling them what it is?"

Are you using good lumber, **Arkansas Soft Pine,** to cement existing relations between yourself and your customers?

Arkansas Soft Pine is enabling scores of dealers to secure and retain trade. There exists no reason why you should not be numbered among the scores who have been and are being benefited. **ARE YOU?**

Hilke Stacker

Hilke Lumber Stacker

A Saver of Space, Lumber, Time and Money

This machine will pay for itself from one to six times per annum, all depending on the scope of its opportunities.

It reduces by half the cost of piling and unpiling lumber.

It saves half the cost of alley floors or roads.

It reduces by half the number of pile bases.

It cuts squarely in two the cost of roofing lumber.

It saves just half your yard space, and this always means much even where land is very cheap, because it costs money and lots of it to haul lumber around a yard.

It takes lumber down from high or low piles with perfect freedom from breakage or injury.

It sets the pace for the men and helps them to do much work with little labor.

It is as mobile as the men who operate it and when placed in front of a pile is instantly ready for work.

It removes at once and forever the need of using elevated tramways, with their great first cost, impaired circulation and imperfect drying below their surface.

It is a maker for efficiency because it is itself so efficient that it naturally turns the lumberman's mind toward other possible yard economies of which there are usually many never before observed.

It is patented in the United States and Canada by Henry C. Hilke.

Ask us for a catalogue.

A 30-foot Hilke Piler in the yard of Shevlin Clark Company, Ltd., Fort Frances, Ontario, Canada.

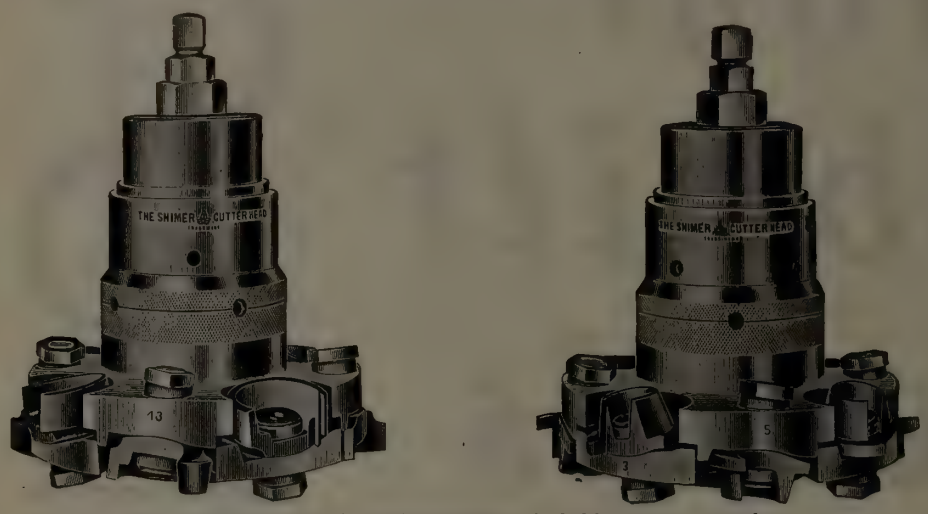
THE SHIMER CUTTER HEADS



The "Shimer Limited" with expansion $72.46 per set, complete.

There Are No Delays

when an order for mill work comes into a planing mill where Shimer Cutter Heads are in use. No matter whether the order is for Flooring, Ceiling, Siding, Wainscoting, Ship Lap, or Door and Sash mouldings, there is no waiting until a high priced man forms cutters to do the job. The Shimer Heads are simply slipped on the spindles and the machine starts in to turn out uniform patterns of quality work.

When it is necessary to sharpen cutters there is none of the usual delay in touching up the shape, because Shimer Cutters never change their shape when being sharpened.

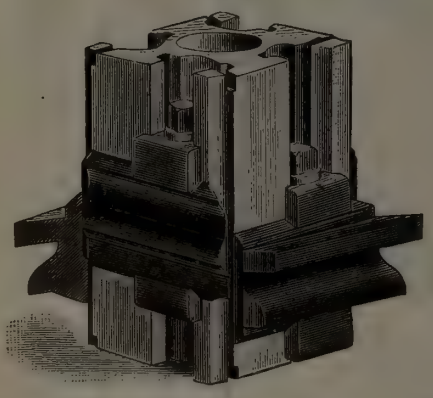
The Permanent Shape of the Shimer Cutter insures uniform patterns—insures that patterns made today will match with those made at any time in the past or future. It prevents all over-runs and left-overs from getting into the scrap pile and insures their sale along with the next batch put through the machine.

The saving in time of the men and machines—the saving in stock and the fact that many pieces of a cross-grained nature are saved from the offal pile, all work together for the prosperity of the mill man.

Shimer Cutter Heads must be seen at work to be appreciated. That's the reason we are so free in offering trial. Their good points have been demonstrated in so many thousands of mills that we welcome your order for a set on trial.

Send it today!

The Shimer Combination Head for Doors, Sash, Blinds and Mouldings



The Head illustrated herewith is intended more particularly for the mills which make only a few mouldings or Door and Sash patterns and change work several times a day.

The outfit consists of one Combination Head with one set of Sash Bits, one set of Door Bits, one set of Cope Heads and Door Cope Bits and two Sash Cope Bits for the lower Door Cope Head.

The Bits are quickly changed and set to the gauge, when the Door and Cope moulds or the Sash and Cope moulds will match to a nicety. Bit can also be adjusted for different thicknesses of Door and Sash mould.

Price of outfit complete $47.31, guaranteed to be made of the best materials and sent on trial.

Our Popular Cutter Heads

Figs. 202 and 203 are the leading tools, having Conical Duplex Bit Seats and The Shimer Cutter Head Expansion. Flooring Bits will work from 13/16 to 1¼-in. in thickness with tongue and groove proportions expaned to suit.

Price, net, complete with one set of flooring Bits, the gauges for setting the Bits and wrench $40.95

Extra Bits for Flooring 11.44

Extra Bits for ceiling 10.40

With 4 bits to each head.

Jointer Heads

Figs. 54 and 55, with four Bits in line of work, shear the cut downwardly to insure a sharp and clean upper edge. They cut clean and free and are shipped out under our guarantee to give satisfaction.

Price, Heads, complete with Bits for 15/16 to 1¼-in., net only $31.20

Extra Bits 1¼-in. face, the set 10.40

Extra Bits, 2-in. face, the set 12.48

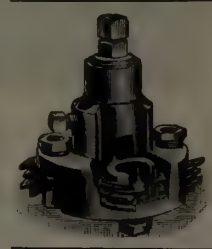
O. G. Batten Heads

Figs. 48 and 49 represent our best tools for this work, having 3 Bits in line of cut so arranged upon their seat inclines as to protect all but cutting edge against friction and wear.

Price, two Heads, complete with Bits, net only $31.98

Extra Bits, each, net 2.08

Double Ceiling Heads



Figs. 45 and 46 are made in solid section, steel forged, with Bits of special design to cut two tongues on one edge of board, and two grooves on opposite edge, to be re-sawed for two thin boards tongued and grooved. Very complete.

Price, with one set of Bits, net $40.94

Extra Bits, per set of (8) 16.64

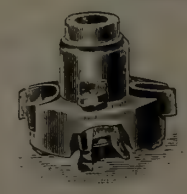
Ship Lap Heads

Figs. 38 and 39 are made of steel forgings, in solid section, designed especially for heavy duty. The bit seats have the latest improved slants to provide free cutting edges, and we sell them at the following low and net prices:

Heads with one set of Bits to work 15/16 to 1½-in. thick, net $34.84

Extra set of Bits 11.96

Door, Sash and Coping Tools



That save all the hand fitting. No changing of patterns, therefore, no trouble in framing door and sash parts when matched with the Shimer Cutter Heads.

DOOR AND SASH HEADS

Fig. 82, solid flange, Door Head $10.75
Fig. 84, Expansion Door Head 13.35
Fig. 86, solid flange, Sash Head 9.75
Fig. 206, Expansion Sash Head 12.35
Bits to work 1-in. to 1¼-in. Doors, 4.. 7.28
Bits extra to work 1 to 1¼-in. Sash (2 Moulded Bits, $4.30; 2 Rabbeting Bits, $2.86) 7.16

COPE HEADS

Fig. 83, Cope Heads (2) $12.90
Coping Bits, each 1.43

The Shimer Box Board Matching Heads

make a uniform cut and close fit, as well after years of use as when new, with no friction upon the Bits. For thicker material the Bits can be expanded.

Price for two Cutter Heads to match ⅛ to ½ inch, $29.15.

We also furnish when desired a Yoke Mandrel with self-oiling boxes, boxed f.o.b. Galt, $11.05.

All Our Babbitt Metals are made up to FORMULA not down to PRICE

Scientists have told us where we came from and preachers where we are going, and now our fundamental duty is to accomplish the most good in life.

If we want to live well we must render service to our fellow men.

To give service to all users of Babbitt metals has been our one great aim. The enormous growth of our sales is excellent testimony that our efforts are appreciated.

WE HAVE TWENTY MORE REASONS JUST AS IMPORTANT AS THESE—

6 Reasons

Why You Should Specify

Harris Heavy Pressure

It will give excellent service.
It will not crack or squeeze out.
It will run cool at any speed.
It is copper coated and copper hardened.
It is known as the Babbitt Metal without a fault.
It is the best for general machinery bearings.

WE MANUFACTURE IN CANADA

AND

All our babbitt metals give excellent service

For a quarter of a century we have had a reputation for high quality. Send an order to our nearest factory.

Head Office and Factory, **Toronto** *Branch Factories,* **Winnipeg, Montreal**

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Deputy Minister.

Department of the Interior, Ottawa,
December 20th, 1912.

Dominion Regulations Respecting Timber, Minerals and Homestead Lands

Timber on Dominion Lands

Licenses to cut timber on Dominion lands in the provinces of Manitoba, Saskatchewan and Alberta, the Northwest Territories, the Railway Belt and the Peace River tract of three and one-half million acres in the province of British Columbia, shall be disposed of by public auction at an upset price fixed by the Minister. The auction shall be held at the office of the Dominion Timber Agent for the district. Berths shall not exceed twenty-five square miles; shall be surveyed by a Dominion Land Surveyor, and thoroughly cruised by a timber cruiser employed by the Department. The expense of the survey shall be charged to the successful bidder.

Purchases of $1,000 or under shall be paid in cash at the time of sale. Purchases over $1,000 shall be paid partly in cash at the time of sale and the balance in instalments. The licensee shall pay an annual ground rental of $5 per square mile, except for lands west of Yale, B.C., in which case the annual rental shall be 5 cents per acre.

The dues on the principal timber products cut under license are as follows:—

Sawn lumber 50 cents per thousand feet, board measure.

Piling and cribbing one-half cent per lineal foot.

Railway ties 8 feet long, 1½ cents each and one-quarter cent for each additional foot.

Yearly Permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

Timber in Forest Reserves

The Director of Forestry may approve of contracts for the sale of timber from Dominion Forest Reserves up to 5,000,000 feet, board measure, in any one sale, by tender at an upset price. The timber is sold, after due advertisement, and not more than five years is allowed for removal. Applications for sales of timber under 5,000,000 feet, board measure, should be made to the Forest Supervisor, on forms which may be secured from him, and should be accompanied by a deposit of $50 to ensure the submission of a tender when the sale is advertised.

Each tenderer must submit with his tender as a guarantee deposit to secure the fulfilment of the terms of the contract, an amount equal to one-fifth of the estimated dues at the upset price, when the total dues do not exceed $5,000 and one-tenth when the total exceeds that amount. The purchaser will be required to submit quarterly returns of the timber cut and the dues will be payable at these quarterly periods. All timber cutting on the reserves shall be done under the control of a forest ranger, subject to regulations prohibiting unnecessary waste of timber and providing for proper brush disposal and for reproduction of the timber.

ANNUAL PERMITS to cut limited quantities of timber may be granted to settlers and others upon application to the Forest Ranger or the Supervisor of the Forest Reserve.

Mining

Coal—Coal mining rights may be leased for twenty-one years, renewable, at an annual rental of $1 an acre. Not more than 2,560 acres can be leased to one applicant. Royalty, five cents per ton.

Quartz—A person eighteen years of age and over, having made a discovery may locate a claim 1,500 feet by 1,500. Fee $5. At least $100 must be expended on the claim each year, or paid to the Mining Recorder. When $500 has been expended or paid and other requirements complied with, the claim may be purchased at $1 an acre.

Placer Mining Claims are 500 feet long and from 1,000 to 2,000 feet wide. Entry fee, $5. Not less than $100 must be expended in development work each year.

Dredging—Two leases of five miles each of a river may be issued to one applicant for a term of 20 years. Rental, $10 a mile per annum. Royalty, 2½ per cent. after the output exceeds $10,000.

Homesteads

Any person who is sole head of a family or any male over 18 years old, may homestead a quarter section of available Dominion land in Manitoba, Saskatchewan or Alberta. The applicant must appear in person at the Dominion Lands Agency or Sub-Agency for the District. Entry by proxy may be made at any agency on certain conditions by father, mother, son, daughter, brother, or sister of intending homesteader.

Duties—Six months residence upon and cultivation of the land in each of three years. A homesteader may live within nine miles of his homestead on a farm of at least 80 acres, solely owned or occupied by him, or by his father, mother, son, daughter, brother, or sister.

In certain districts a homesteader in good standing may pre-empt a quarter section alongside his homestead. Price $3 per acre. Duties—Must reside six months in each of six years from date of homestead entry (including the time required to earn homestead patent) and cultivate fifty acres extra.

The homesteader who has exhausted his homestead right and cannot claim a pre-emption, may take a purchased homestead in certain districts. Price $3 per acre. Duties—Must reside six months in each of three years, cultivate fifty acres and erect a house worth $300.

W. W. Cory,

Deputy of the Minister of the Interior.

Department of the Interior,
Ottawa, 1st June, 1914.

Rubber Belting

for Power Transmission and Conveying

Good Rubber Belting is not injuriously affected by heat, cold or moisture; is perfectly uniform in width and thickness; is very strong; is smooth and adheres closely to the pulleys, thus insuring maximum power transmission.

Duck especially woven to insure greatest strength and least possible stretch; good rubber to hold the several plies securely together, and a high grade rubber cover all combined in the best possible manner, make our rubber belting pre-eminent for excellence and satisfaction-giving qualities.

"Imperial" Stitched Rubber Belting has long been well-known for its superior merit. The rows of stitches add materially to to the strength of the belt, and it is often possible to use an **"Imperial"** stitched belt with one ply less than would be required in a regular rubber belt.

"Universal" Fine Duck, Friction Service Belting is especially adapted for use on woodworking machinery, where the pulleys are small and the belt speed high. It has proved its merit by good work in many places.

We also manufacture a great variety of rubber **Packings**—including sheet, piston and pump packings—**Hose** of all kinds and for all purposes—**Valves, Gaskets, Springs, Tubing, Mats and Matting.**

The quality of **BOSTON BELTING CO.** prodncts is well known, and mechanica. rubber goods bearing our Trade Mark are in daily use throughout the entire country. If you specify **"Made by Boston Belting Co."** when ordering mechanical rubber goods, you will assure to yourself material that is

"Superior in Quality—Satisfactory in Service."

We solicit your enquiries and orders—

Patented 1911

No. 152 Long Leg Seamless Heel Draw String Moccasins

The latest improvement in Moccasins doing away with all seams at heel. Under the old method the heel would come down and in a short time the wearer would be walking on it, wearing out the stitching, thus causing it to leak and rip. With the new process the heel will not flatten out, will always keep its shape and there are no seams whatever, making a clean smooth Ripless and Waterproof heel. Made only in the highest quality, all heights of leg, with or without soles or heels.

WRITE FOR CATALOGUE AND PRICE LIST.

You are never in doubt when you buy from Borbridge. We have been dealing with the lumbermen of Canada for upwards of a quarter century.

MILKSTOCK

The Lumberman's Milk

is pure separated milk in powder form.

This is the best form of milk for camp use, because:—

1. It is most convenient. Easy to use.
2. It is best flavored. More like fresh milk.
3. It is purest. Nothing but milk in it.
4. It is not hurt by freezing.
5. It is not hurt by hot weather.
6. It will keep indefinitely even after the tin is opened.
7. It is most portable. Weighs only one quarter of condensed milk.
8. It can be used for everything requiring milk. Flapjacks or Rolls, Cakes and Custard Pies, Tea, Coffee and Cocoa, Soups or Sauces.
9. It is cheaper than condensed milk, even aside from the great saving in freight and transportation.
10. It is **MILK**—Contains no useless water. Has no preservatives in it.

Many camps are using no other milk. Those who have tried everything repeat on **MILKSTOCK**.

For camp use put up in cases of Six Ten Pound Cans, and in Fifty Pound Drums.

THE HARRIS ABATTOIR COMPANY, LIMITED

Your Lumber Horse Needs

A talk with the Lumberman of Canada on the modern and sanitary system we have installed to serve your requirements

FINANCIAL RESPONSIBILITY

WE are in a position this season to supply the lumber trade with the finest heavy horses suitable for camp work. We have shippers in the very best heavy horse district in Western Ontario, who make personal selections and take only the best. Every horse we ship out is guaranteed to be just as represented by us as to age, soundness, weight and quality—there is more than two million dollars behind this guarantee. These horses can be delivered off the incoming cars and transhipped in an hour from our yards.

SERVICE

Our barn accommodation is up-to-date in every particular and has stabling accommodation for 500 horses. A track is also maintained for exercising horses while on the company's premises.

SANITATION

Believing that prevention is better than cure, and to give the very best service possible we have this year employed a veterinary surgeon under salary. A daily and most thorough inspection is made by him of the entire barns and in this way the slightest indisposition is noted and the animal suffering immediately removed to the hospital on the grounds. "Safety first" is our motto in this respect.

TRANSPORTATION

Our premises being directly on the lines of the C.P.R., G.T.R. and C.N.R., our rail facilities are such that we are in a position to ship on an hour's notice, and loading and unloading chutes are located right at the barn doors.

We gladly invite inspection of our entire system. Come and let us show you the most modern and sanitary system in Canada.

CARSS MACKINAWS

for Miners and Lumbermen

Carss Pure Wool Mackinaws are the only genuine waterproof mackinaws made in Canada.

Since their introduction among miners and lumbermen, some thirty years ago, their reputation for strength and warmth has spread from coast to coast.

They are manufactured especially for the vast army of men employed in the mining and lumbering camps throughout Canada, and are well suited to stand the hard wear they have to undergo.

The census of popular opinion is in favor of Carss Mackinaws. Let us send you sample garments for inspection, so that you may join the satisfied majority,

WHITE MOTOR TRUCKS
Predominate In America

BOTH IN THE QUANTITY OF TRUCKS SOLD AND IN THE VALUE OF TRUCK SALES, WE ARE THE LARGEST MANUFACTURERS OF COMMERCIAL MOTOR VEHICLES IN AMERICA

Official Records of the Motor Truck Industry Verify This Statement

This Leadership of the Truck Industry is of the utmost importance, both to the many who already own White Trucks, and to the many others who will eventually purchase White Trucks.

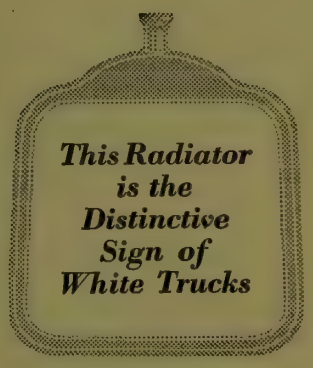
TO THE OWNERS OF WHITE TRUCKS

THIS LEADERSHIP proves the correctness of your judgment in selecting your motor truck equipment.

It shows that you have chosen the same motor truck that the majority of truck users in America have selected.

In practically every case, this selection has been the result of a process of rigid experimentation and elimination, in which White Trucks have proved their superiority over all others.

This preference for White Trucks by the largest users of motor trucks as well as by the majority of motor truck users guarantees that your investment is protected by a successful, well established manufacturer, having a superior organization for rendering permanent and efficient service during the life-time of the trucks.



TO FUTURE OWNERS OF WHITE TRUCKS

THIS LEADERSHIP is conclusive proof that White Trucks must be superior to all others, because White Supremacy is not measured in numbers alone, but in value as well.

With so many makes of motor trucks on the market, all clamoring for recognition, indisputable supremacy can be gained only by superior merit.

Untruthful advertising, bargain prices, exaggerated claims and guarantees that cannot be fulfilled may make the first sale, but only superior merit can create the confidence which brings continuous repeat orders.

The record of continuous repeat orders whereby the foremost firms in America have acquired huge fleets of White Trucks, after experimenting with other makes, is a convincing reason why you should use White Trucks.

WHITE TRUCKS ARE MOST ECONOMICAL TO OWN

That White Trucks are slightly higher in price, makes White leadership in the truck industry even more complete. It is plain evidence that White construction is so superior that the higher first cost of a White Truck is economy in the long run—proof that White Trucks last longer and cost less to operate and maintain, making them the most economical trucks to own.

White Trucks are built in capacities of ¾, 1½, 3 and 5 tons

A SUITABLE SIZE FOR EVERY VARIETY OF SERVICE

THE WHITE COMPANY

CLEVELAND, OHIO, U. S. A.

MANUFACTURERS OF GASOLINE MOTOR CARS, MOTOR TRUCKS AND TAXICABS

AFTER MAKING CAREFUL TESTS THEY CHOSE PACKARD TRUCKS

In buying a motor truck to haul lumber, the considerations are the service you want, the economy you have a right to expect, and the stability necessary to protect your investment. The letter of the Boake Manufacturing Company tells of careful and systematic tests for the best truck. It explains why they chose the Packard:

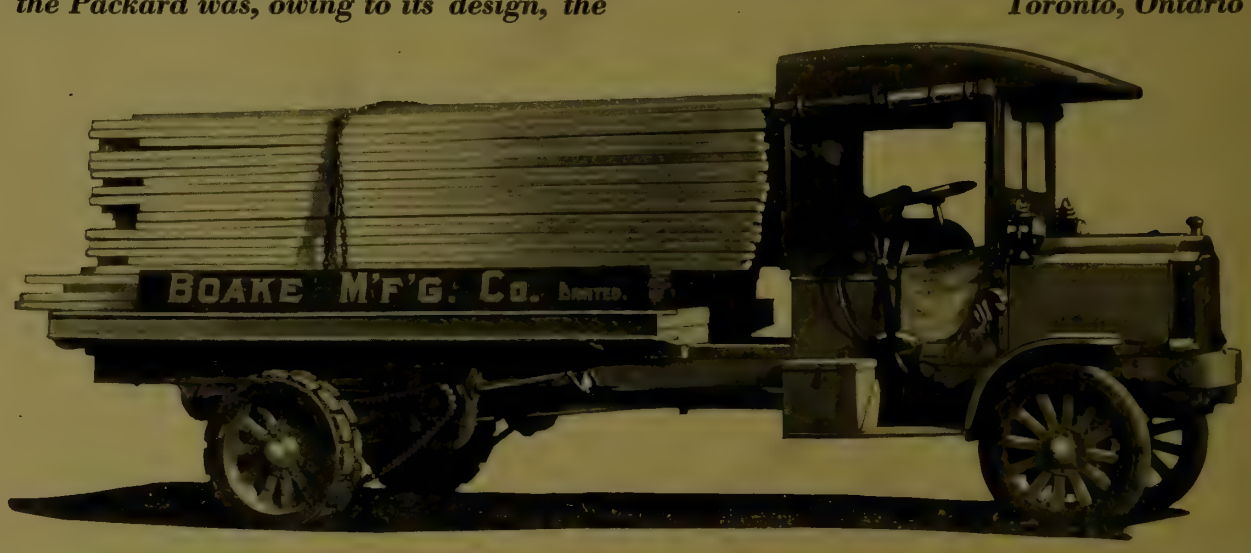
"We have been using motor trucks for the past four seasons, and we purchased our first Packard truck in March, 1912. We selected the Packard after making tests as to the practicability of four different makes of trucks in the delivery of lumber. We had also had two previous years' experience in the use of a truck of a different make in our business. We have also had different makes of trucks hired for weeks at a time. This was done partly to help out in the delivery of our orders and partly to gain some experience in the use of motor trucks before actually placing an order for more.

"We at last came to the conclusion that although the four makes of trucks which we were considering were all good trucks, the Packard was, owing to its design, the best adapted for the purpose of our business, and so purchased one in March, 1912, and another in April, 1913, and have since placed an order for a third.

"The platform of the body is equipped with four iron rollers so that the load can be rolled on and bound in less than five minutes, and when we arrive at the building can be unloaded in less time. All that is required in unloading is to unbind the load, roll it back till it balances on the hind roller, and then drive out from under it.

"By using the motor trucks for delivery we find that we can handle orders that have to be delivered several miles away, which it would not be possible for us to handle with our horse and wagon delivery."

BOAKE MFG. COMPANY, LTD.,
Toronto, Ontario



Packard Motor Trucks are built in five sizes, having a maximum load capacity of two tons, three tons, four tons, five tons, and six tons respectively. The chassis can be had in several lengths of frame. Bodies to meet the requirements of the lumber business can be had to fit the standard Packard chassis.

Solid and Inserted Tooth
Circular Saws

We make a specialty of these lines

We remake old Solid Tooth Saws into new Inserted Tooth Saws

Write to us for quotations.

Our saws have been before the public of Canada since 1855, and have won a reputation far excelling any other make of saws, combining as they do so many points of marked superiority.

By the old method the tempering of circular saws was to a great extent a matter of chance.

By our Patent Process that uncertainty is entirely avoided.

Being tempered and straightened by heat and pressure in air-tight ovens at a uniform heat between heavy revolving plates, we produce a perfectly even temper throughout the plate, and being free from that uneven strain or tension caused by so much unequal hammering they are not so liable to buckle, which was a great source of trouble and expense in the old style of saw.

These saws will stand up to their work better under all circumstances, and being made of a higher quality steel than it is practical to use by the old method, they hold an edge longer and will do more work than any other saw on the market.

We are prepared to make prompt deliveries of all Saw Orders—Rush Orders by mail or wire receive immediate attention.

Dominion Belting Company, Limited

HAMILTON - ONTARIO

Branch: Montreal—Office 51 Duluth Building

G&K 1851 TRADE MARK

Educational Talks on Leather Belting.

Proper Installation of Belting

The proper installation of belting is just as fundamental to transmission efficiency as the proper selection of weight, quality and thickness. Maximum service must be obtained from belting by following certain general and long established rules.

First—Be sure pulleys are in line, and shafts parallel.

Probably more belting is ruined by improperly lined shafting and pulleys than by any other cause. Belts operating under such conditions are often kept on the pulleys by guides. They sometimes rub against hangers or portions of machines. As a result a lap starts open, the belt catches and tears. If no such accident happens, the belt usually stretches excessively on one edge. Belts so stretched will not run straight and are apt to run off the pulleys and become torn or otherwise damaged.

Test—If a belt climbs to one side of the pulleys look for trouble in the shafting. Turn the belt around, and if it till climbs to the same side of the pulley you have proved that the shafting is out of line.

Remember that because shafting was once in line it does not follow that it stays so indefinitely.

Second—Avoid putting on belts too tight.

When belts operate too tightly the leather is overstrained and injured. There is excessive friction at the bearings with a consequent loss of power. If belts run too losely, they are likely to flop around and jump from the pulleys, especially where loads are intermittent or suddenly applied.

The slacker a belt can be run and transmit the required power without slipping, the greater the economy of the drive.

Third—Be sure every belt runs in the proper direction.

Single belts should be put on so as to run with the grain or hair side next to the pulleys.

All belts should be put on so that the points of the laps on the outside of the belt point away from the direction in which the pulley is revolving.

Fourth—Exercise care when joining belting.

A cemented lap is not difficult to make, and is the most satisfactory method of joining a belt. It means increased life, smoother running, fewer repairs and therefore greater machine production. When a cemented lap is not practical, a laced joint is the next best method. But this joint must be made properly, extreme care being used to have all strands under equal tension, or a crooked belt will result. Always avoid the use of large lacing holes—they weaken the end of the belt; also avoid unnecessary bunches of lace—they cause slipping.

Fifth—Avoid water, oils, greases, etc.

Ordinary leather belting should not be used where any of these destructive elements are present, unless it is possible to protect the belting by mechanical means. But remember that G. & K. NEPTUNE Belting will withstand moisture and water, and is guaranteed not to open at the laps or between the plies even when wholly submerged. G. & K. SPARTAN Belting is guaranteed to resist the action of water, oil, acid, fumes, and steam.

While we have offered above only a few general suggestions about the proper installation of belting, we wish to emphasize the importance of this point in securing an efficient drive. In the case of special drives, the details must be analyzed and the best belt secured. Our Engineering Department will gladly investigate any drive and recommend the proper belting and installation.

Our "Belting Manual," fresh from the press, contains ninety pages of useful mechanical rules and valuable information about belting, and its proper installation, selection, and care. A copy will be sent you gratis on request.

Subject for next month:—"The Care of Belting."

Figure it out Yourself

Goodhue Belts

have the stretch taken out before you get them and "the 15% less stretch" means an overall economy of 15% on your belting costs.

Every time you "take up" a slack belt it usually means cutting out a **useless** piece. In a year these pieces represent considerable belting **all paid for** but of **no use** to you. All this is **additional** to the time lost in tightening belts and **power lost** through slack belts.

Use Goodhue Belts aud reduce your belting charges and "belt labor" by 15%. 'Tis worth considering.

Leviathan Belting

Has been sold on a "make good" basis for over thirty years. If it hadn't made good we would have been out of business long ago. The fact that our business is progressing rapidly is ample proof of the merit of this belting.

With every belt we guarantee full value in service, dollar for dollar, horsepower for horsepower, and just as we have figured our tables of horsepower for the best results, just so in making the above statement, we not only expect to give equal service, but **better service, and more economically.**

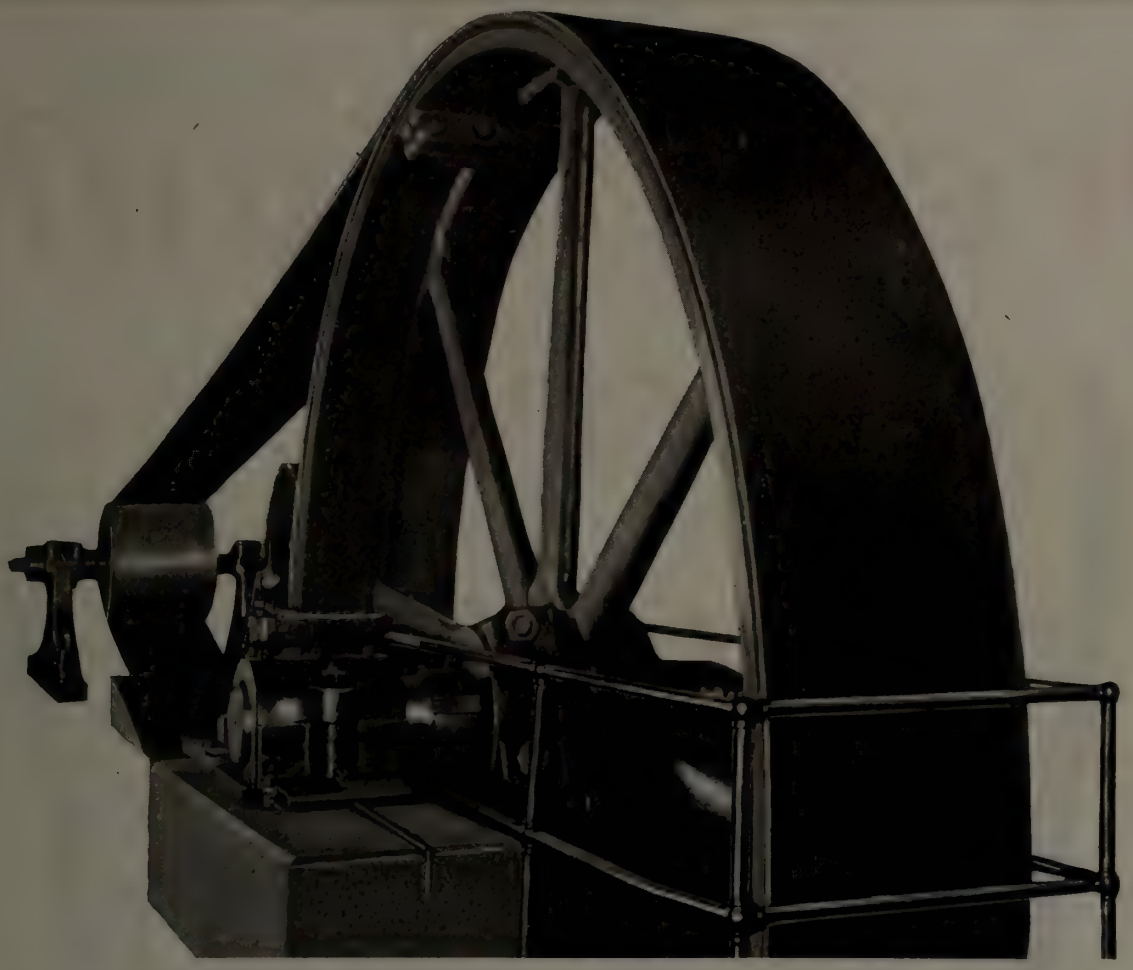
THE REASONS WHY:

Leviathan has far greater tractive power.
Leviathan can be run much slacker than leather, thus putting less strain on the journals.
Leviathan is not affected by atmospheric changes.

Why not give us a trial order
and let LEVIATHAN prove itself?

Main Belting Co., of Canada, Limited

MONTREAL TORONTO



The Right Belt

Buyers of mechanical equipment for the sawmill are choosing belts for **Service.**

The really efficient sawmill keeps figures. Mere price is no longer a determining factor in the buying of equipment. Nowadays men want the records. They judge by **service rendered**—and that is the true gauge of quality and economy.

More and more these men are consulting Goodyear experts in the selection of their equipment. They know that these men are constantly solving new problems in belt efficiency. They know that the very belt for the very purpose is to be found in the Goodyear line. And they are buying with **certainty** because Goodyear experts can give them specific service facts about every particular Goodyear product.

"Extra Power"

Here for instance, is a Goodyear Belt designed for the main drive—edger and planer. It is wonderfully strong. It stands the "gaff" when a big gnarled log hits the saw. It goes right on working under the terrific strain.

"Extra Power" shows the highest friction pull of any belt we have ever tested—fully 10 per cent. better than the next best high quality belt. It is made of the heaviest and strongest duck we use—all laboratory inspected and tested. The stretch is taken out in the making.

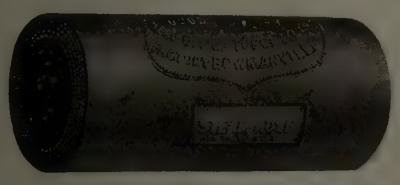
Like every Goodyear belt, "Extra Power" is cured under heavy and carefully regulated hydraulic pressure. This means absolute unity of the plies. Separation cannot happen.

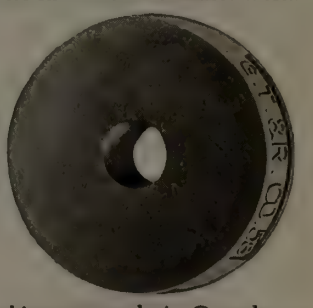
GOODYEAR
TORONTO
Extra Power Belt

Again, every Goodyear Belt has the famous Sealed Seam, another exclusive Goodyear feature. This unifies the seam, making every belt virtually seamless.

"Imperial"

Here is another Goodyear Belt for the sawmill. Designed especially for high-speed and small-pulley conditions. A fine belt for trimmer work.





Hose and Packing

Goodyear Hose and Packing are made for exact service. A special tube compound for every purpose. A particular packing for every joint.

Buy This Way

Let your equipment be **service** equipment. Buy the Goodyear way. Goodyear products, whethe belts, hose or packing are made in Canada at the Bowmanville, Ontario, factory. Here are employed the same quality standards that have won the leadership for Goodyear Automobile Tires.

Ask Goodyear to tell you just what product for the very purpose, and why. Costs nothing to ask questions. Involves no obligation. Write today.

The Goodyear Tire & Rubber Company of Canada, Limited

Dreadnaught Steel Hames

No. 8382

Strength Test 6400 lbs.
Length 29 inches over all.
For 20 to 24 inch collars.
Bolt draft for 2 inch trace.
All standard finishes.

TO operate economically you must load your sleds and wagons to their full capacity. But do your hames stand the strain of moving such loads? How many pairs did you break last year. It's not the price of new hames but the loss of time that counts. A broken hame may hold up a team and two or three men for several hours. Minimize such delays—buy **Dreadnaught Steel Hames.** You can ill afford to buy any but the best.

No. 8682

Strength Test 6400 lbs.
Length 30 inches over all.
For 20 to 24 inch collars.
Bolt draft for 2 inch trace.
All standard finishes.

For strength and durability **Dreadnaught Steel Hames** are without a peer. They are made of two pieces of selected steel cut and shaped separately and then forced securely together in powerful presses. This forms a perfect truss—the strongest possible construction. They are reinforced at points of greatest strain. By actual test they are stronger than any other hames of similar style. They fit the collar like a glove. Insist on having them for this year's work.

McKinnon Dash Co.

Buffalo, N. Y. **St. Catharines, Ont.**

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3.00.
Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canad aLumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster General for Canada, for transmission as second class matter.

Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

Vol. 34 **Toronto, August 15, 1914** **No. 16**

What Will the War Do to Trade?

When the annual issue of the Canada Lumberman for 1913 was published a year ago, the opening editorial contained the statement that there was always a refreshing individuality about business conditions. We were thinking of the trials through which the lumber trade, in common with others, had passed during the previous twelve months, and were taking comfort out of the conviction that the trials of the past were probably preparing us for favors that were to come. Our remark about the "individuality" of business conditions has been more than proved, but as to the "refreshing" nature of it, there may be two opinions. The conditions that have been thrust upon the whole business world during recent weeks, by the coflict on the continent of Europe, are startling, and of stunning magnitude.

It would be of no avail, under these conditions, to encourage either panic or confidence in regard to trade. We simply are in the dark, groping for the light. Business has been stricken, in some quarters, as a tree which has fallen before a storm. There is probably less reason for this however, than most people would admit. Even with the war raging at its height, there is justification to-day for expecting a silver lining to the clouds. If the allies are successful, it is the conviction of many, that better business conditions will in the end prevail. But, in the meanwhile it will take many years to recover from the waste of men and money now taking place. With the return of peace the lumber trade, in common with many others, will be face to face with peculiar conditions. There will be a renewed and probably a great demand for stocks. There will also be a great scarcity of stocks, and there will at the same time be such world-wide demand for money, that industry will be hard pressed to produce the stocks required. There should then be a great opportunity for those countries which are best prepared to furnish the world with its prime necessities. The warring nations will have abandoned, in large measure, their activities in one another's markets. They will be handicapped in their efforts to get business, by the exertions and sacrifices they have made. It is more than likely that the people of those countries that have not been extensively drained of men and money will be best able to take advantage of trade expansion following the return of peace. This is the hopeful aspect of the situation. Just where we are to-day, however, is the most absorbing topic of interest from a business point of view. A lumberman who keeps in close touch with trade conditions at all times, and whose opinion in regard to them is probably as sound as possible, has written for us the following analysis of the situation:—

To imagine one's self in a boat, on a broad expanse of water, minus oars and sails, and drifting at the will of wind and current, is, perhaps, a fit characterization of the condition in which the lumber business of Ontario finds itself to-day.

It is hard to interpret, or define, the source and trend of trade beliefs and opinions, but, after a year of regular and persistent liquidation, the general business sentiment of the country, seemed to be, following the turn into the year of 1914, that the time had come for a resumption of constructive effort on a definite, if not largely expanding scale. As a debtor nation, we had been audited and examined by eminent financiers from abroad, in the interest of our creditors, with the pronounced verdict that business conditions with use were sound, and that we could reasonably hope and expect a gradual return to the satisfying conditions of development that had been peculiarly ours for a period of years, up to 1913. Admonition was plentiful that every suggestion of speculation must be frowned upon, and only legitimate business encouraged.

A result of these hopeful conditions manifested themselves in our own trade, with a good volume of business during late winter and early spring, that was pretty broadly distributed, except in a few sections. In this, we were no doubt helped and influenced by the conditions, which were prevailing in the States, and, where, coincident with our own activities, a revival was likewise being experienced of much the same nature. In neither country, however, did this revival continue, and by early summer we found ourselves again facing flagging business. Since then the word "fitful" entirely characterizes the situation. The regular consuming demand has continuously emptied the bins of dealers, and as regularly they have been refilled; the business has been peculiarly of the "hand-to-mouth" variety. In a way, we were reconciled to this, knowing, by experience, that a condition of moderate dullness, in mid-summer, is inevitable, and we have been satisfied that once the Fall was upon us, the revival of the ordinary trade of the season, would keep us reasonably busy. Collateral to this belief has been the realization that our productive capacity has been largely curtailed, and that in spite of a retrenched consumption, stocks at mill points have not grown. We have nowhere any considerable accumulation of lumber, or lumber products, and this perhaps explains why, with a few exceptions, prices have, on the whole, remained firm, and in some instances advanced.

We have also been influenced by a knowledge that slowly, but surely, conditions in the United States were greatly improved, and as these improvements were realized, we were bound to share in the benefits. Our exports of lumber to that country make us most vitally interested in their welfare, to say nothing of our relation to their other activities. All these expectations, are, however, practically set at naught, by the condition in Europe. This has all come so suddenly, and is so portentous in its possibilities, that he is a brave man, who will predict the extent and scope of its effect. It is fortunate that it has come to us this year, instead of in 1913. We are in better shape to endure the unsettlement of commercial relations. We have liquidated much indebtedness at home, have scaled down our speculative values, and the basis for doing business is generally sound.

In times like these, judgments, by incidental experiences, are superficial and biased. It seems to us that we must be guided by a philosophy that recognizes the fact that consuming demands must be met, that whatever may be the immediate effect of European conditions, the boundless resources and the natural opportunities of this country, will be needed to meet these demands. In the meantime, we must be possessed of patience, and be guided in all our desires and activities, by the realization that Time is the sure solvent of all difficulties, and to those who possess the resources and the ability will come ample reward for their endeavors.

The Reader's Viewpoint on Trade Topics

Recent Trade Developments Commented Upon By Lumbermen—Reports Upon Drive Results and Probable Logging Operations

A prominent lumber manufacturer of Ottawa in a recent letter to the Canada Lumberman reports that one of the most interesting subjects of discussion among lumbermen in the Ottawa Valley today is the effect of low water upon the drives in the provinces of Ontario and Quebec. He reports that one of the large mills in the Ottawa Valley had to stop sawing at nights some tine ago, owing to the low water. This will cut their output about in half. Two other large mills, he says, are securing logs from day to day with great difficulty. Other important mills have had to shut down two or three days in a week because of the shortage of logs. He expects that some of the mills will close for the season during August. Discussing the outlook for production this year, he refers also to the fact that J. R. Booth's mill was out of commission for several weeks on account of temporary damage. Taking all these factors together, he considers it probable that the Ottawa Valley cut this year will be about 100,000,000 feet short. The same writer also advises us that he understands upon fairly good authority that the cut of lumber in the St. Lawrence River district or Quebec, is likely to be greatly reduced this year.

No Reason For Panicky Trade

Editor Canada Lumberman: Snow Road, Ont., Aug. 8.

For the past three months sales and collections have been exceedingly slow, notwithstanding the fact that stocks in retail yards are, and have been low. This is no doubt the result of tight money, as yardmen are working up and disposing of all odds and ends they have that can possibly be made use of. In fact they have been cleaning up, and preparing for the better trade that has been expected.

Hemlock is not only scarce in retailers' hands, but also light with the manufacturers throughout Ontario and Eastern Canada. Most of our customers are having a fair trade, some reporting sales nearly as good as 1913 which was their banner year, and many being ahead of 1912.

A factor that has operated against the manufacturers, cutting off their sales, while the yardman has been doing good business, is the continued dumping in Ontario of southern and sugar pine, and Michigan hemlock and maple, free of duty. There can be no question but that these products have displaced large quantities of lumber manufactured in Canada, which accounts for part of the dullness felt by mill men here. The same measure of protective tariff that is given to other manufacturers, if given the lumbermen, would largely remedy this unnecessary, and unjust condition. Lumbermen should get together in an effort to secure from the Canadian government proper tariff legislation.

Notwithstanding these adverse conditions however, and the greater adversity of war now upon us, with a cut of only 60 to 75 per cent. of normal in Ontario, and with present low stocks in retail yards, we believe the time is coming in the near future, when lumber will be in good demand at good prices. While naturally the first outcome of war is panic, we sincerely believe there is no occasion for people to get frightened, and unnecessarily throw their goods upon the market. Now is the time to steady conditions by holding your goods till they are called for. The trade will take only what it can't possibly get along without, till matters get in a more settled condition; and we think it will be found that trying to force sales by cutting prices, will not only not make sales, but will further weaken conditions. Our sales are at present only about half what they were last year at this time, but we have maintained our regular last year's prices in everything except spruce, which we are selling this year at hemlock prices.

While it is uncertain what course the banks will now take with regard to the financial requirements of legitimate business, it is to be hoped they will be governed by the same broad-minded patriotic spirit, as has been exemplified by the present action of the Canadian government toward the prevention of any financial scare that may be brought about in Canada as a result of the war. We believe a course of reasonable credits to responsible business, should and will be given, as far as possible, by the banks, to the end that all legitimate business and industry may be steadied through the present emergency, after which larger trade and commerce must ensue, as a result of the heavy demands of war upon all industry. While no patriotic citizen desires to make profits out of the waste of war, it still remains a fact, that war must increase the value of all commodities, and that a great European conflict will necessarily make heavy demands upon such products of both Canada and the United States as will be required for the prosecution of the war, thus increasing generally the demand for all commodities. This being so, business should make use of what little encouragement there may be in this, toward dispelling any feelings of panic or despair, to the end that all may be prepared with calmness and coolness to do whatever may be required toward upholding, maintaining, and strengthening the integrity, and supremacy of the empire in this time of its greatest need.—The Chandler Jones Lumber Company.

Changing Conditions Affect Hamilton Trade

Editor Canada Lumberman: Hamilton, July 16.

The building trade here this summer is not what it has been for the last six or seven years. A great number of manufacturers who contemplated extensions have reconsidered the matter and decided to await more encouraging conditions. The increased demand for fireproof construction is also seriously affecting the consumption of lumber. In fact there have been practically no large factories erected here lately that have called for anything in the shape of lumber, except for form work, and in most cases hardwood flooring, and generally some office partitions, etc.

The substitution of steel and cement for timbers, joist, window frame and sash, and a number of other purposes, is making large inroads in the business of the planing mill and lumber yard, and it is just a question in the mind of the writer if the game is worth the candle. When you consider the great difference between this class of construction and what is known as slow-burning mill construction, I question if the additional cost does not largely exceed the saving in insurance. Another feature presents itself to my mind. Why build a factory to stand for say the next fifty years, when the probable advancement in the different lines of manufacture will, in most cases, revolutionize present methods and probably call for altogether different arrangements to those at present in vogue, long before these buildings have passed their usefulness?

These changing conditions decidedly affect the kinds and quantities of stocks which formerly were considered our best sellers. For instance, 3 x 10 in., 3 x 12 ., in varying lengths, as well as the timber squares are giving place to the 1 x 6in., 1 x 8 in., 2 x 6 in., 2 x 8 in., and 4 x 4in. spruce and jack pine for false work, and the consequence is that the lowest grades are bringing prices out of all reason as compared with a good sound knotted white pine strip, scantling or joist.

Another thing that has demoralized the market here, is the dumping of transit cars of so-called yellow pine. This has been sold below the price of No. 1 hemlock; but at that in most cases it has been the dearer lumber. Our experience has bee nthat this stock produces everything that is faulty. In the first place the tree from which most of it is manufactured is about as shortlived a species of wood as grows. Next, the manufacturing is as a rule disgraceful; then the stock is fired into a car with about as much judgment as you would expect from men who never handled lumber, and after four or five weeks of sweating in transit, it is a disgusting mess when you come to unload. Then, should you decide to pile it, you are up against another problem, how to make a decent job of piling stuff which varies in a great many cases an inch in thickness and probably an inch and a half in width, and trimmed (if trimmed at all) 3 in. or 4 in. over or under the specified length. These are some of the objections to the bulk of this class of stock.

Along with the curtailment in factory and warehouse construction naturally follows similar conditions in the erection of dwelling houses, and in this class of business the tightness in the money market has been keenly felt. There is very little sale for completed buildings and no inducement for further ventures just at present. However, we look for improvement in the near future and expect next spring will probably start things on the upward tendency once more.

Prices here have been fairly well kept up and we are in hopes that the trade will keep in mind the fact that cut-throat tactics will not be conducive to better business.—The Patterson-Tilley Company.

Hemlock Men Favor Curtailment

A meeting of the hemlock manufacturers of Ontario was held at the Queen's Hotel, Toronto, on July 30. Among those in attendance were N. C. Hocken, Hocken Lumber Co., Otter Lake; Wm. Elbery, Fenelon Falls; A. C. Mambert, Graves, Bigwood & Co., Toronto; Edward Martin, Muskoka Wood Mfg. Co., Huntsville; L. M. Dougherty, Graves, Bigwood & Co.; J. D. McNeil, Shorheed Lumber Co., Kearney; J. D. Shier, Bracebridge, and Joseph Bird, Bracebridge.

Mr. Hocken occupied the chair and in his opening address reviewed market conditions. He said that, while trade had fallen off, there had been but little decrease in prices. In some instances ab-

normally high figures had been obtained last year, but apart from these exceptional cases, prices had been well maintained up to the present. There seemed at present to be an unsettled feeling in the trade, as the crops were not altogether satisfactory, and the war was affecting the stock market, but he did not think that it would affect the lumber trade to any extent. He advocated a conservative policy. Sales could not be increased by reducing prices. The only competition they had to fear was that of Michigan hemlock, and prices might have to be shaded a little sometimes to meet that. He had no doubt that the Michigan hemlock was being sold on the Canadian market at lower prices than on the other side and if this could be clearly proved by investigation the government might be asked to enforce the dumping clause. No more hemlock should be cut this year than would be sufficient to meet requirements. He thought that 1916 would see a good market. If there were operators who had stock on hand that they were unable to sell they should send their stock sheets to some firm who would help them to get rid of it.

Mr. J. D. Shier said that his stock was practically all sold, though at somewhat smaller figures than last year's. He had heard of a good deal of price-cutting as the competition of American hemlock had to be met. He certainly thought the American stock was being dumped on the Canadian market and agreed with the chairman that it would be well to limit this year's cut. Money was going to be tight and it would be difficult to get advances from the bank for lumbering operations. He considered that operators were paying altogether too much for logs.

Mr. J. Bird pointed out that many towns and villages were almost entirely dependent upon the lumber industry, in view of which the banks should deal more liberally with them. The banks had money for speculators which they refused to legitimate lumbering operations. There was a growing scarcity of hemlock and operators had to go further back every year so there was no need to cut prices.

Mr. J. D. McNeil said that sales could not be made at present prices. It was best to go easy and curtail production this year.

Mr. E. Martin advised caution, as money was evidently going to be tight. It was hard to make sales except at a reduction.

Some further discussion followed showing that the meeting was practically unanimous in favoring a curtailment of production and continued price maintenance as far as possible.

Will Operate On Same Scale as Last Year

Editor Canada Lumberman: Huntsville, Ont., August 6.

We have two camps of about sixty men in the woods. We usually peel about from two to three thousand cords of hemlock bark each year. The peeling season lasts from June 1st to August 1st. Our bush men cut and skid the hemlock that has been thrown down, and swamp the bark into large piles. We have at present between two and three nillion feet of peeled hemlock, upon which our men are engaged. They will cut and skid the hemlock and will also take out any spruce pine or hardwood that may be on the lots on which they are working. We expect our operations for 1914-15 to be about equal to the operations of 1913-14. Wages are considered less than in the fall of 1913. At the present time $28 is high. A year ago we paid as high as $36.

Business in rough lumber this year has been quite active. Our sales have been much in advance of any previous year. There has been a large quantity of American hemlock and southern pine put on the Canadian market this season at a price that held Ontario hemlock prices from advancing. In fact the manufacturer was compelled to accept from one to two dollars less, in many cases, than last year's prices. In talking with several American lumbermen, they claim that they were selling this stock at a loss and that the American market was so unfavorable, that they were compelled to unload, even if they did make a loss on 25 per cent of their stock. The companies who were able to supply hemlock in assorted lengths and widths, did not suffer to the same extent as the smaller manufacturers. We realized, up to the present time, practically as much for the 1914 stock as for our 1913 cut. July and August are usually quiet months and we have the utmost confidence that we will find business better during the fall months. Hardwood flooring has not moved as well during 1914 as in 1913 and 1912. We believe that prices for the lower end of hardwood will be somewhat lower. The price of the uppers will not be affected by the slowness in the furniture and flooring trades. We believe that birch will maintain its present price and there may be a slight advance in firsts and seconds.—The Muskoka Wood Manufacturing Company, Limited.

Expect Crops to Improve Lumber Trade

Editor Canada Lumberman: Ottawa, Aug. 4.

Up to the present, our trade has been about normal this year and, while we find some of our competitors claiming that conditions are improving, personally, we have not noticed any material change. However, with bumper crops almost assured in Canada and the United States, one would look for a revival of business in general during the late winter and early spring of next year. This may be off-set if war breaks out again in the Balkans, which no doubt will have a tendency to retard the revival of trade until conditions get back to normal in the east.

We are advised that prices on low grade southern pine, have recently advanced fifty cents per thousand feet ,with a likelihood of a still further advance in the near future. That, along with the short cut in the Ottawa Valley this season should help to improve at least the lumber business in Eastern Canada in the course of the next four or five months.—Shepard & Morse Lumber Company.

Brighter Outlook at Pembroke, Ont.

Editor Canada Lumberman: Pembroke, Ont., Aug. 3.

We are pleased to state that market conditions are looking somewhat brighter in this district. The spring trade was rather disappointing at the outset, but a steady betterment has been noticed, and from present indications, a good fall trade is expected.

Our logs are all now in the main river, and are in no danger of being stuck, although we are not getting them to the mill very quickly.

So far this season, we have not lost more than forty-eight hours on this account, and do not anticipate any further loss of time.

We understand that some of the mills have lost considerable time up to now, and it is quite probable that the cut will be curtailed twenty per cent. on this account.—The Pembroke Lumber Company.

Got Out All Their Drives

Editor Canada Lumberman: Ottawa, Ont., Aug. 3.

All of our logs in last spring's drive were delivered into the Ottawa River by the first week in July. Regarding the other firm's drives, we understood that some of them were hung up but we cannot speak with authority on this point.

As to the coming season's operations in the camp; it is our understanding that there will be about the same amount of logs taken out as there was last year. While a few of the operators expect to take out considerably more timber on account of property recently acquired having a quantity of blown-down timber, there are others in the trade who contemplate a considerable curtailment on last year's operations.—Shepard & Morse Lumber Company.

Suspect Extensive Price Cutting

Editor Canada Lumberman: Burks Falls, Ont., August 1.

Business seems to be very difficult to get this year. Evidently there is an enormous amount of price cutting being done, as we have several times lost large orders to other mills, which we were informed had bid much lower than we did, although we had given what we considered to be a very low price.

Comparing this year's business with last years, we may say that, for the first six months of 1914 the volume of our business has been 79 per cent. of that for the first six months of 1913.—The Knight Brothers Company.

Trade Quiet At Chesley, Ont.

Editor Canada Lumberman: Chesley, Ont., Aug. 3.

Last year was a very good one for us in the lumber trade. During the present season, trade has been very quiet. Not much building is being carried on in this locality. So far, prices have held up well. Our stock this year is mostly hardwood, which I think will be quiet for some time, as the factories are not buying any great quantity of lumber. However, I expect the market to brighten up after the harvest.—Jas. Anderson.

Drives Cost More Than Usual

Editor Canada Lumberman: Lindsay, Ont., July 25.

We find trade conditions very little changed. It is quiet in orders for railroad construction. Elm and ash are scarce, and the market is good. Hemlock is holding its own. Lath are scarce.

Owing to the scarcity of water, several of the drives were held up and those that did come down cost a lot of money to land. We do not look for any reduction in prices.—The John Carew Lumber Company, Limited.

Find Trade Still Active

Editor Canada Lumberman: Buffalo, N.Y., August 3.

We have been favored with shipping instructions right through the spring and summer, and today are pretty well shipped up on seasoned stock. We expect to resume shipping again by the middle of the month, and are looking for steady demand throughout the summer following and winter.—New Ontario Colonization Company.

Keewatin Trade Depending Upon the Crop

Editor Canada Lumberman: Keewatin, Ont., Aug. 3.

Market conditions with us are hardly as good as they were last year. The ordinary business being slightly smaller. Present conditions, from the market standpoint are poor. The fall trade will depend entirely upon the crop, and it is rather too soon yet to say what this will be.

A Cheerful Note from Nova Scotia

Editor Canada Lumberman: Bear River, N.S., Aug. 6.

The present season is rather a peculiar one. Owing to the almost entire absence of satisfactory demand from the South American markets, a change has been necessary in the manufacturing of the smaller class of logs. Speaking for ourselves, we have not found the change detrimental. A number of orders came to us from various American points, for small sizes, which have used up most satisfactorily everything we had to dispose of up to the present time, and, prompt shipments being required, we have never been so closely shipped as at present. This probably is due to two causes, one the excellent demand from the American points above referred to, the other the fact that we got our mills started much later than usual.

In sawing South American lumber, we frequently have to pile up some millions, awaiting the time when satisfactory tonnage can be secured, which is a serious disadvantage, and it would appear, if present conditions are to continue, that the South American market is not of as much value as we have heretofore supposed.

The cut in the western part of Nova Scotia was smaller than usual last season, due to the fact that some of the operators who formerly cut large quantities of lumber are doing nothing during the present year. While the cut in this locality is fully up to the average, the cut in the western part of Nova Scotia will be some thirty millions less than the average for the past ten years. We have in hand at the present time, unfilled orders for about four millions of lumber, and are daily receiving orders which we are unable to supply. Personally, therefore, we have no fault to find with present conditions although we do hear from some quarters that this condition is not general.

The prevailing sentiment seems to be that with the approach of autumn we are to experience a revival in all branches of trade, in which the lumbering industry will share.

Our understanding is that the close of the present year will see the smallest quantity of lumber carried over into the next year, and a closer clean-up, than for the past twenty years.

We see no reason for discouragement. Demand is arising for various classes of manufactured goods which can be made from the class of stuff which a few years ago we regarded as of little or no value, being practically by-products of the lumbering industry.

With the increasing demand and the decreasing supply, the inevitable law of "supply and demand" will produce the usual result, namely, the enhancement of values in all grades of lumber—Clarke Bros., Ltd.

Nova Scotia Spruce Trade Improved

Editor Canada Lumberman: Weymouth, N.S., Aug. 4.

Trade in spruce has been at fair prices, and it is now commanding cash f.o.b. here—the old commission consignment plundering at the delivery end being almost eliminated. Hemlock also has been in fair demand at profitable spot cash prices.

Pulp has been low and markets over-stocked, but old contracts this year have been fairly lived up to, so that low profits are helping us out. Both of these features—shirking of contracts on a broken market, and very high freights in 1913—were very annoying trade features.

We have many millions of virgin growth birch, beech and maple, and would appreciate very much any information which would lead us to a fair outlet. Unlike other timber, this must be sold this year before it is cut.—Campbell Lumber Company, Limited.

New Brunswick Export Trade Dull

Editor Canada Lumberman: St. John, N.B., Aug. 3.

If anything the United States market is worse now than it has been any time during this season. The English market has shown no life. There has been a slight easing in prices during the last month and freights have advanced from 5s. to 7s. 6d. per standard.

Stocks on the other side are ample, in fact, they are too heavy and there does not seem to be any chance for any immediate improvement.

In reply to your recent enquiry, my mill at South Bay is 178 ft. long by 54 ft. wide, with a monitor extending the whole length of the mill. The foundations for the building and for all the machines are concrete, and the mill is equipped with a single cutting band mill, and one Giddings & Lewis horizontal resaw with divided rolls. The slabs go through one side and the deals and planks go through the other. Then there is the usual lath mill, also trimmers and edger, a box-making machine, and one heading machine. In addition to this there are nine stave machines, five of these being for the manufacture of barrel staves, the others for keg staves. I have not used these four keg machines this season, on account of the dullness in the nail trade.

The lumber business as a whole in the Maritime Provinces this year is not very satisfactory. The English market has slumped off since last winter and the American market is practically nil. Business has never been so dull with them for a number of years. We are, however, living in hopes that next year we may see improved conditions and prices.—John E. Moore.

Ottawa Firms May Reduce Woods Operations

Editor Canada Lumberman: Hull, P.Q., Aug. 4.

We are convinced that the cut of lumber in the Ottawa Valley this year will be very considerably reduced. We are unable to even approximate the quantity.

Recent events have changed the whole aspect of the lumber business. Men are being withdrawn from the woods, and certain of our manufacturers are contemplating doing little or no lumbering this winter.

As you are aware shipments from the Port of Montreal for Liverpool are completely at a standstill and in other directions lumber is not moving well.

By this time you are doubtless aware that our company has had a very serious fire, which destroyed several millions of feet of lumber. For ourselves, we have not as yet decided just what we will do in the way of getting out logs, whether to make none at all or only half of the usual cut.—Gilmour & Hughson, Limited.

Southern St. Lawrence Drives Successful

Editor Canada Lumberman: St. Pacome, P.Q., August 1.

From information I have received, I understand that practically all the drives on the South Shore of the St. Lawrence River, and most of the drives in New Brunswick were taken out successfully.

Regarding the North Shore, there seems to be a certain quantity hung up, but information regarding this is hard to secure, as every other lunberman you meet has a different version regarding the quantity hung up, especially on the St. Maurice River.—W. Gerard Power.

Quebec Production Depending on Money Situation

Editor Canada Lumberman: Trois Pistoles, P.Q., August 1.

Some of the sawmills in Quebec began sawing late this spring, on account of the log drive being delayed. We cannot see, however, that there will be any heavy decrease in the production of lumber in this district, unless the money sringency should affect the heavy manufacturers.—Trois Pistoles Pulp and Lumber Company.

The Outlook a Matter of Doubt

Editor Canada Lumberman: Montreal, Aug. 5.

While we sometimes think there is a slight improvement in business, it is very hard to make any definite statement as to the outlook for the fall trade. Up to the present, trade during 1914 has not been as good as it was last year.—The McLennen Lumber Company, Limited.

Ontario Furniture Trade Buying Little Hardwood

Editor Canada Lumberman:

We see no prospect of improvement in the demand for hardwood lumber, as the consumption depends entirely upon the furniture business. The latter, at present, is about as slack as it can be and prospects for inprovement are poor.

From what we can learn and from our own observation we believe that on account of the heavy wind fall in 1913, a great deal of the hardwood was blown down in the counties of Bruce, Grey, Simcoe, Huron, Perth, Wellington and Dufferin, and in order to save this timber it was marketed last winter. In consequence, every little mill as well as larger ones, were stocked to their full capacity. This, under the most favorable circumstances, would be more than sufficient for home consumption in the furniture line, but adding to this the depression in trade, there will probably be twice as much hardwood lumber on hand this fall as there was a year ago. Under these circumstances we can not see that lumber will rise in price, or even hold its own. The stability of the hardwood lumber business seems to us to depend largely upon the holders' ability to carry their stock.

Consumer.

Mr. R. D. Craig, of Vancouver, B.C., has been appointed by the Conservation Commission of Canada to make a survey of the timber resources of British Columbia and other areas lying west of the Cascade range. Mr. Craig will determine the quantity of timber, its location, etc., and his findings will be issued in the form of a bulletin by the commission.

Ontario Woods and Forests Report

Total Revenue Accrued of Over Two Million Dollars —Output Reduced by about Five Million Feet

The annual report of the Minister of Lands, Forests and Mines of the Province of Ontario for the year ending October 31st, 1913, has just been issued. The total revenue accrued for the year ending the 31st of October, 1913, from woods and forests was $2,127,22265.—an increase of $59,162 over last year. The revenue collected during the year from the same source amounted to $1,979,125.81, which was only about $6,000 less than the collection of last year; and last year was somewhat of a record year, as the revenue collected exceeded that of the previous year by $274,000. The revenue derived from timber dues was $1,277,490.08 as against the collection of $1,339,957,12 for last year. The collection on account of bonus was $591,676.29 as against the collection of $540,702.85 for last year. The collection on account of ground rent was $99,460.19, as against $96 262 for last year. The collection on account of transfer bonus was $10,500, as against $8,740 for last year.

Statistics of Operations

The area under timber license for the season of 1913 was 17.519¼ miles, as against 18,410 miles for last year. The area under license fluctuates from year to year for the following reasons: Areas are cut out and surrendered by the licensees and there are other areas on which the ground rent is not paid and the license does not issue. There was surrendered this year 257 miles and new licenses were issued for areas sold during the year amounting to about 100 miles. The output of pine sawlogs, booms and square timber in feet board measure was 360,377,168 feet board measure, which is 127,661,498 feet board measure below the output of last year. The output of timber other than pine was 64,497,036 feet board neasure as against 69,373,572 feet board measure for last year. The quantity of pulpwood taken out from Crown Lands was 131,434 cords as against 140,338 cords for last year. There were 6,355,828 pieces of railway ties taken out this year as against 5,704,559 for last year, or an increase of 651,269 ties over the output for last year. It will be seen that, as was expected, the output of all kinds of timber was considerabliy below the output of last year, except railway ties. The great scarcity of money compelled a number of lumbermen to shorten up their operations, while others did not operate at all. It is not expected that there will be much increase in the cutting of the present winter as the financial stringency has not entirely ceased.

During the year the pine timber in the Townships of Thistle and McWilliams tributary to Lake Nipissing was offered for sale by public tender. The Departnent had careful examinations made of the Townships which showed that a large percentage of the timber in them was mature and that the large timber was very faulty. There was a request from the Ontario Pulp Company to be allowed to get a part of its supply in these townships, and there was the danger of fire owing to the construction of the Canadian Northern Railway in the neighborhood. Under these circumstances it was considered advisable to offer the timber for sale, and it was accordingly sold, subject to an increase in ground rent from $5 to $10 per mile, and an increase in the timber dues fron $2 per thousand to $5 per thousand, and the important condition was put in that no trees of a less diameter than 12 inches on the stump 2 feet from the ground should be cut. The increase of the ground rent and timber dues was a substantial one and the conditions prohibiting the cutting of small trees were new. The amount realized from the sale was $147.500 or an average per acre of about $3 with $5 per thousand to be paid when the timbed is cut.

Fire Ranging

The fire ranging service during the sumner was composed of 217 rangers in forest reserves, 208 on railways, and 114 on lands of the Crown. There were 34 chief rangers including the services of the Crown Timber Agente; 4 assistant chief rangers, and 8 supervising rangers on licensed lands, making a total of 585 men. The timber licenses had on their various limits 350 rangers, so that the total staff of firerangers on duty last year was 935 men. There were no serious fires during the past season on lands of the Crown except in the Township of Dana, and there the timber damaged was disposed of and will be cut this winter. On licensed territory the Georgian Bay Lumber Company had sone timber burnt by locomotives of the Canadian Pacific Railway, and on the Booth limits tributary to the Mattawa River some timber was damaged in the course of railway construction. These are the only fires of any consequence which occurred on lands of the Crown or licensed territory during the present year.

The expenditure on fire ranging for the past year has been as follows:

On Crown Lands	$65,000.00
On Railways	80,000.00
On Forest Reserves	88,000.00

The report shows that the area covered by timber licenses was 17,519¼ square miles. The actual output of pine saw logs is given as 338,802,011 feet board measure, which consisted of 8,562,298 pieces. The output of saw logs other than pine was 58,703,426 feet b.m. Pine boom and dimension tinber was cut to the extent of 15,458,077 feet b.m. and other boom and dimension timber to the extent of 5,492,-549 feet b.m. The output of square timber was 511,490 cu. ft. The production of tan bark amounted to 4,508½ cords. Railway ties were produced to the number of 6,355,828 pieces. The pulpwood production amounted to 131,434 cords.

The amounts accrued to the woods and forest branch were made up as follows:—transfer bonus $10,500.25, interest $9,015.57, trespass $19,625.02, timber dues $1,272,816,36, bonus $614,227.86, deposits on timber sales $101,940.50, ground rent $99,097; total $2,127,222.56.

A Western Souvenir Worth Having

A handsome pennant was issued by the Hoo-Hoo of Southern British Columbia in honor of the great Concatenation and Pageant Parade held in Vancouver on June 12th last. The Great Black Cat is shown upon the pennant wearing a crown in order that he may not be mistaken for a green-eyed prowler from the onion beds of Washington, just across the border. As there were some two hundred pennants remaining on hand after the parade, Mr. J. G. Robson, Vicegerent Snark of Hoo-Hoo, conceived the happy idea that Eastern Canada Hoo-Hoo might welcome a chance to secure one as a souvenir of the greatest demonstration ever held by the Black Cat fraternity of the Pacific Coast province. Given the place on the office wall that it is fitted to adorn, the pennant will interest every visitor and serve to strengthen the bonds which unite all members of the order—east, west, north or south.

Send one dollar to Timberland Lumber Company, Limited, Westmintser Trust Building, New Westminster, B.C., and you will receive one of these handsome souvenirs by return mail.

Upper Fraser River Company Being Reorganized

At a meeting of the shareholders and bondholders of the Upper Fraser River (B.C.) Lumber Company, held in Montreal on August 3, a scheme of reorganization was adopted. The company own 280 miles of timber limits between Fort George and Tete Jeune Cache. Owing to delays in the construction of the Grand Trunk Pacific Railway, the company were unable to meet the interest on the bonds, as no revenue was coming in, and a reorganization was necessary. It is stated by an official that the erection of the frame of the permanent mill at Dome Creek has been completed and it has been roofed in, and stables, bunk-houses and sundry other buildings have been erected. About 120,000 feet of sawn lumber is in the yard and 100,000 feet of logs on skids ready to be sawn. About fifteen acres adjacent to the building has been stumped and cleared. The grading of the spur from the mill to the main line of the Grand Trunk Pacific has been completed, and is ready for the laying of the steel. Everything is practically in readiness for the installation of the mill machinery as soon as it is decided to ship it west.

Under the scheme of reorganization, a new company will take over the assets. The capital is $2,500,000 6 per cent. non-cumulative participating shares, $750,000 common shares, and $750,000 first mortgage 6 per cent. 25 year bonds. The existing bondholders have agreed to exchange their bonds at par for an equal amount of preferred shares, plus an amount representing all arrears of interest. The holders of existing common stock are entitled to an allotment of fully paid ordinary shares equal to ten per cent. of their existing holdings, the balance being held in trust. The board express a high opinion of the quality of timber, logging facilities and general position of the property.

A Forest Protection Campain in B. C.

The forest branch of the Departnent of Lands, Victoria, B.C., has put into operation a systematic campaign for forest fire protection. Altogether, over fifty thousand curculars, psoters, pocket whetstones, etc., have been distributed all over the province, to lumbermen and wood men of all kinds, newspapers, banks, hotels, stores, clergymen, school children, etc. The response has been most gratifying. The latest and probably one of the most effective moves in the campaign is the plan to reach the people by means of moving picture theatres. A numbed of educational slides have been designed and will be shown at practically every moving picture theatre in the province, through the co-operation of the proprietors. The pocket whetstones sent out by the branch have been designed specially for the boy scounts of British Columbia and a large number of them have been distributed through the scout masters.

New Plant of Graves, Bigwood & Company, at Byng Inlet, Ont. Panoramic view showing Log Booms, Sawmill, Box factory, etc.

Splendid New Sawmill at Byng Inlet

Graves, Bigwood & Company's Modern Plant—Producing Two Hundred Thousand Feet in Ten Hours—Exceptional Efficiency Secured

On May 20th, 1912, the town of Byng Inlet, Ont., suffered one of the most serious losses by fire in its history. One would hardly imagine, upon visiting the town today, that its prosperity and activity had ever suffered a really serious blow. Nevertheless, those in the lumber business know well that the splendid mills of Graves, Bigwood & Company were utterly obliterated by fire on the above date. The loss was not only a serious one for the firm, but a terrible misfortune for the people of the town, where it is the sole industry of importance and gives employment to a great nunber of men. Some time elapsed before the company completed their plans for building a new mill. Operations were at last commenced in May, 1913, and the new mill, as it stands today, was put into operation in September of the sane year. Today it is operating steadily and in the most satisfactory manner. It has an ordinary capacity of about 200,000 feet in a ten hour day.

The old mill at Byng Inlet was built by Holland & Graves, the predecessors of the firm as it exists today. This mill had been operated for fourteen years, when it was destroyed. The firm of Graves, Bigwood & Company consists of L. P. Graves, W. E. Bigwood, A. C. Manbert, H. I. George, and N. Holland. Sawmilling operations have been carried on at Byng Inlet since the early eighties. Such lumbermen as Anson Page, Burton Bros., and the Georgian Bay Lumber Company, have at one tine or another been large operators at this point.

A visitor to the new mill at Byng Inlet is certain to be impressed, first of all, by the remarkable rigidity which has been secured for the plant. This is a result of having placed the building upon solid rock and concrete foundations. The ground floor and foundation walls are also built of concrete. The foundations for the large machines in the mill are of exceptionally substantial reinforced concrete. One of the points of interest in connection with the construction of the building is, that it is furnished with a steel truss roof. This enables the company to omit the use of posts on the sawing floor. Thus there is from one end of the sawing floor to the other, a practically uninterrupted view of every operation. Moreover, the floors of the mill are of exceptional height, giving plenty of room for all operations. The distance between the ground floor and the sawing floor is 16 feet and fron the sawing floor the distance to the roof trusses is fourteen feet. The filing room, which is located directly over the two band saws, is also a spacious room, in which the filer is able to move about with comfort and take excellent care of all his materials and equipment.

Complete and Modern Equipment

In the matter of equipment, the new mill at Byng Inlet is second to none, so far as efficiency is concerned. The sawing equipnent includes two single cutting band saws, a gang saw, two edgers, two horizontal resaws, and two trimmers, most of the equipment having been furnished by the Giddings & Lewis Manufacturing Company, of Fond du Lac, Wis. The machinery is driven by two engines of the Corliss pattern. One of the engines is a Filer & Stowell driving

Sorting platform at Graves, Bigwood & Co.'s new plant, Byng Inlet, Ont.

Interior view of mill, Graves, Bigwood & Co., Byng Inlet, Ont.

The Filing Room—Graves, Bigwood & Co., Byng Inlet, Ont.

the main line shaft. The other is an Allis-Chalmers, and drives the balance of the mill, including the lath mill. The Filer & Stowell engine is of about 450 h.p. and the Allis-Chalmers, 350 h.p. Power is furnished by nine boilers nade by the John Inglis Company, Limited, Toronto, and the Wm. Hamilton Company, Peterborough, Ont.

One of the most interesting parts of the equipment is the trimmer outfit. This is worked by compressed air, having a patent air lift (Cleveland patent), furnished by Giddings & Lewis.

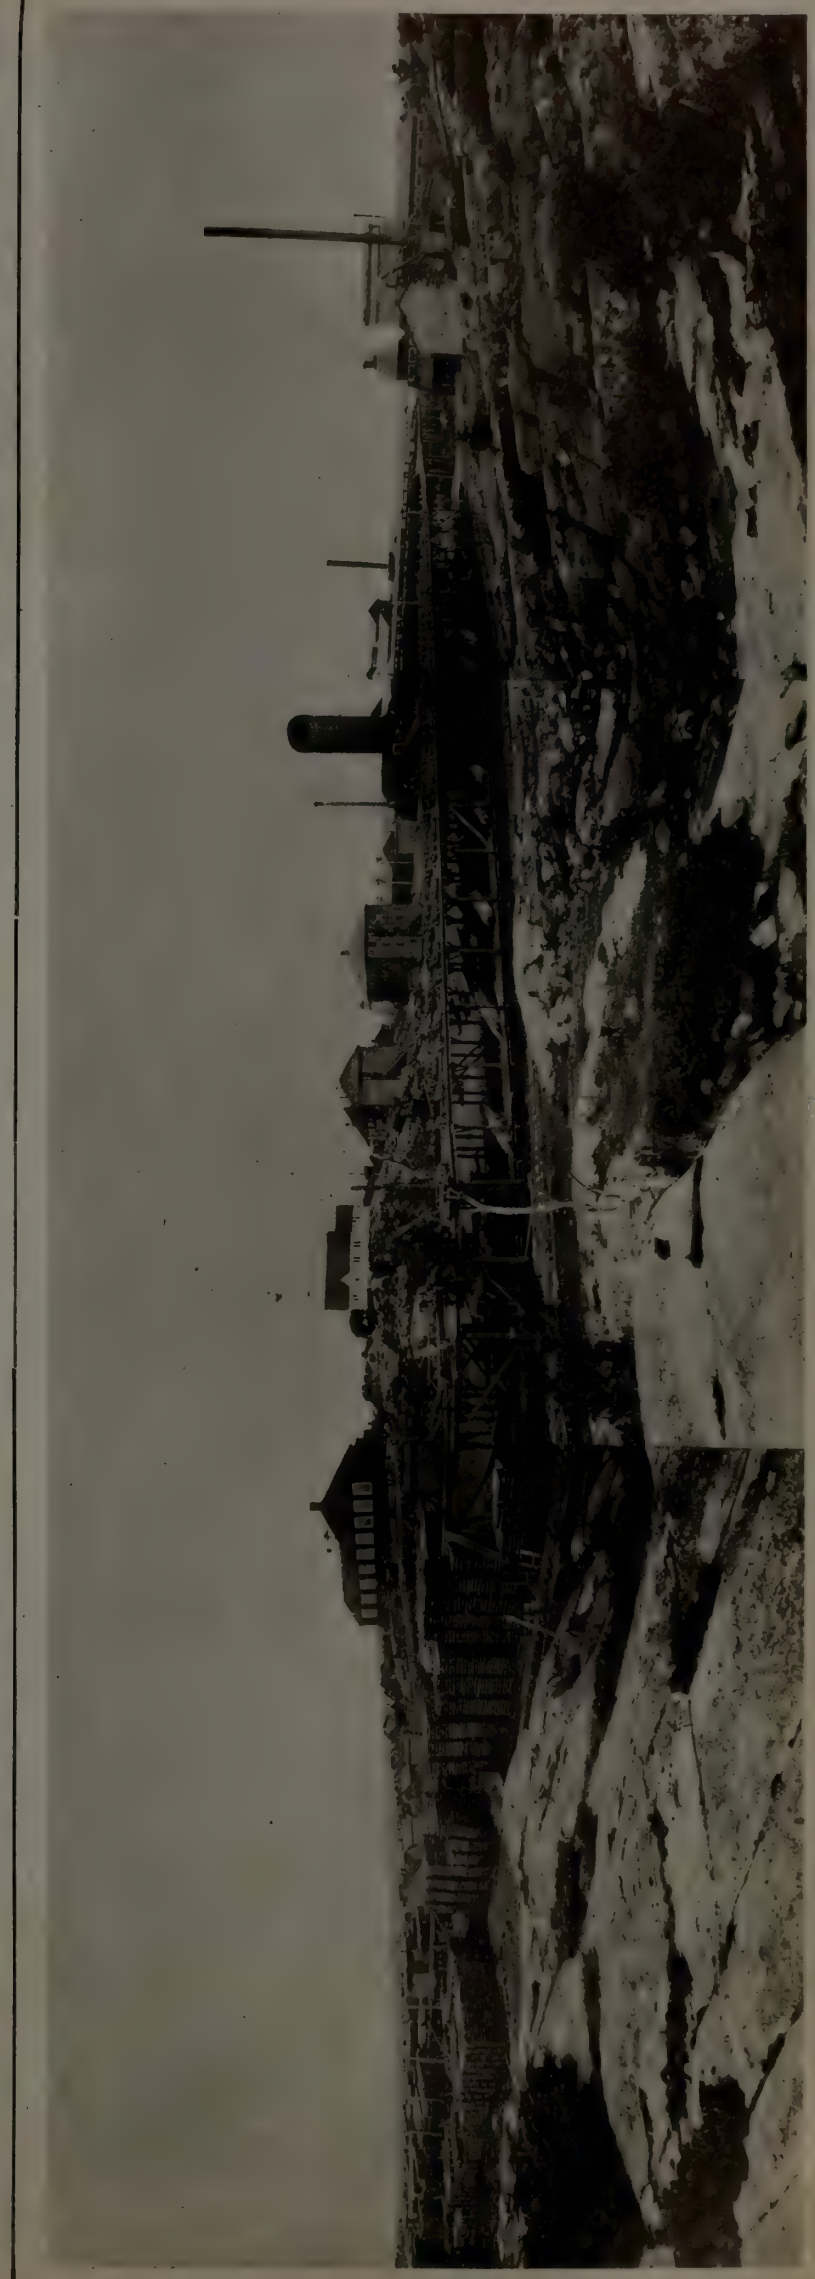
The resaws are practically horizontal resaws to which a few alterations have been added, which the company have found to be especially required for their class of work. The carriages for the two band saws are equipped with steam set works. The two band mills carry saws of fourteen gauge, 12-in. wide. The gang saws are 13 gauge, the edger saws 8 gauge, the trimmer saws 10 gauge lance tooth and the resaws 16 gauge 10-inch.

The equipment for the mill is supplemented by an excellent lath and picket manufacturing plant. The lath mill was furnished by the P. Payette Company, Penetanguishene, Ont., and has a capacity of from 45,000 to 50,000 pieces per day.

The equipment in the filing room includes the latest machines for this class of work, some of then being Hanchett and some of them Covel. The machines in the filing room are driven by a separate engine. Each machine throughout the sawing plant is connected with the driving shaft by a clutch pulley, which enables the company to operate all at one time or to stop any individual machine without closing down the rest of the mill.

The boilers are in a metal and brick building, which is absolutely fireproof and entirely separate from the sawmill. They stood through

The Engine Room—Graves, Bigwood & Co., Byng Inlet, Ont.



Graves, Bigwood & Co., Ilyng Inlet, Ont.—Pathoramic view showing from left to right, Piling Yards, Tramways, Boarding House, New Sawmill, Boiler House and Box Factory.

the fire which destroyed all the rest of the plant, and were not affected in any way.

The mill building is covered with Johns-Manville asbestos roofing, giving it a very neat and substantial appearance. The fire pump for the sawmill building is located in a separate fireproof building and has a duplex steam pump with twelve-inch suction and ten-inch discharge. Another fire pump is provided in connection with the box factory. These two pumps can be worked together, or can be used individually.

The Electric Lighting Equipment

The electric lighting equipment in the new mill consists of a direct connected, direct current C.G.E. generator, driven by an Ideal engine furnished by the Goldie & McCulloch Company, Limited, Galt, Ont. It will furnish current for 600 sixteen candle power lamps. The box factory is lighted by another engine and generator which furnish current for nine hundred, sixteen candle power lamps, which includes the light for the town of Byng Inlet.

The large refuse burner operated by the company is a survivor from the fire. This burner was built by the Wm. Hamilton Company, Limited, Peterborough, Ont. It is 34 x 135 feet. The William Hamilton Company also furnished the smoke stack and main steam connections for the new plant.

Complete machine and blacksmith shops are also operated by the company. The equipment of the machine shop includes two lathes, a planer, a shaper, a power drill and a thread-cutting machine. This is all driven by independent power.

In addition to their sawmill, lath and picket mill, the company operate an up-to-date box factory and planing mill, which are located in a separate building some distance away from the sawmill. The company were fortunate enough to save this building at the time of the fire. The equipment of the box factory and planing mill consists of a complete set of planing machinery, matchers, moulders, rip saws, siding saws, etc. The box factory and planing mill are housed in one building, the former being in the upper storey and the latter on the ground floor.

One of the most important features in connection with the mill is the excellent arrangement for sorting the output. A glance at the illustration of the sorting platform shows that the company have unusual facilities for separation and classification. Room has been made for about 140 divisions, which permits the stock not only to be sorted into widths and lengths, but into an unusual number of grades to suit the varied needs of all sorts of consumers. This enables the company to furnish specialties not ordinarily possible, and emphasizes the unique completeness of their operating facilities.

A good system of elevated tramways connects the sawmill with the yards. These yards are located a considerable distance away from the mill towards the west. The prevailing winds on the Georgian Bay are south west, so that there is practically no possibility of a fire, which might originate in the town, communicating itself to the piles of lumber in the yards. The tramways serving the lumber yards were not injured by the fire. They are built in a very substantial manner, and are considerably higher and larger than the average saw mill tramways.

In the village of Byng Inlet the company own over one hundred houses, which are rented to their workmen. They also conduct three large boarding houses for the accommodation of the employees. One of the most important features in the town of Byn Inlet is the store operated by the company, where an excellent stock of all kinds of necessaries is carried at all times. The company take special care to see that the merchandise is all of a high quality and that the employees get the best possible value for their money. The Byng Inlet offices of the company are located over the store, and on the third floor of the same building are a number of rooms for the convenience of various employees of the company.

Altogether, one cannot fail to be greatly impressed with the remarkable efficiency and completeness of every operation carried on by the company at Byng Inlet. The whole town depends upon this industry for its livelihood, and the company have taken every precaution to ensure that the interests of the people of Byng Inlet are promoted in the most successful manner. The result is a commendable spirit of co-operation on the part of all who work for the company. The town is not only a thriving and peaceful industrial centre, but probably is one of the most law-abiding and respectable communities to be found anywhere in Canada.

Marked Expansion of a Young Toronto Firm

A wholesale lumber firm which has shown remarkable expansion in the face of a quiet season, is that of Read Bros., Limited, Toronto, who carry a full assortment of spruce, hemlock, white and red pine, and of which Mr. Alex P. Read is president, and Mr. Alfred E. Read, secretary-treasurer. During the first half of 1914 the company announce an increase in their trade of over 60 per cent, compared with the corresponding period of 1913. Up to several months ago the Messrs. Read took care of their out-of-town customers personally, but it was found that increasing business demanded more attention, and they have now two salesmen in addition to Mr. Geo. Thompson, who was formerly President of the Goderich Lumber Company and a well-known lumberman of Western Ontario, who is travelling out of Goderich for them, and Mr. A. E. Smith out of Toronto. Mr. Smith was for a time in charge of the plant and operations of O. H. Moxley, of New Liskeard, and latterly for a short time with W. B. McCulloch, of Brampton, and T. H. Hancock, the well-known Toronto retail dealer. This season, among the stock they are handling, Read Bros., Limited, are taking all the soft woods sawn at the large mill at Whitney, Ont., the majority of which will be spruce, and which will approximate 15 million feet. They have two large lumber mills turning out American hemlock and have already this season done a large volume of business in this particular line.

The progress made by this firm has been very marked. In 1910 Mr. Alfred E. Read started in business at 18 Toronto street. The business grew and during the following year he formed a partnership with his brother, Mr. Alex P. Read, under the name of Read Bros. and moved to 43 Victoria street. The beginning of 1913 found the business still expanding and the partnership was turned into a stock company under the name of Read Bros., Limited.

The Muskoka Wood Manufacturing Co.

The accompanying illustration gives practically a bird's-eye view of the Huntsville plant of the Muskoka Wood Manufacturing Company, as it appeared on July 30, 1914. The picture shows two dry kilns with a capacity of 150,000 feet at one time, sawmill, factory, store room, docks, booming ground, general offices, and eight railway spurs, with 5,000,000 feet of lumber in the yard, also a large quantity of lath and slabs. The plant covers fifteen acres extending north to the railway bridge.

At the time that the picture was taken, two cars of birch flooring were being loaded, from the storehouse on spur No. 8, one with

Muskoka Wood Manufacturing Co., Huntsville, Ont. Bird's Eye view of plant.

24,000 feet of 13/16 "Red Deer" selected red birch, for a Vancouver firm, and the second with 22,000 feet of No. 1 "Red Deer" birch for an Ontario firm. The company nanufacture birch, maple and oak hardwood flooring, all thicknesses and stock 3/8 and 13/16 all grades. All flooring is matched, sides and ends bored for secret nailing, steel polished and bundled.

Referring to their Red Deer brand birch flooring the company state that it costs no more than maple, works and lays easier, wears as well and looks better when properly finished. They can furnish rough birch and hemlock bill timber, spruce and white pine flooring and lumber, also lath and shingles, and will be glad to send quotations to any of our readers who apply for them.

The Ontario Lumber Company, which is now in liquidation, is advertising its limits, mills, camps and other properties for sale by tender. The limits cover an area of about 400 square miles and the stand of timber is roughly estimated at 300,000,000 feet, composed largely of hemlock. Mr. Bryan Pontifex, of the Imperial Bank Building, Toronto, is liquidator.

The ravages of the spruce bud worm are causing New Brunswick authorities much concern. Reports have ben received at the Crown lands department in Fredericton from the northern, as well as the southern, section of the Province, with exhibits showing the ravages of the pest, which completely destroys the young buds, causing the whole tree to turn brown. An official of the department said that the unfortunate part of it is that it has no effective means of fighting the pest.

One of Ottawa's Notable Industries

Remarkable Expansion of W. C. Edwards & Co., Ltd.

The City of Ottawa, Ont., is known throughout the lumber consuming world as the home of a number of large saw mills and wood working factories, which have grown up with the lumber industry, and have become of such great importance to the industrial life of the country as to become practically national institutions. One of the most important and striking instances of this industrial growth, is the plant of W. C. Edwards & Company, Limited, at New Edinburgh, an eastern suburb of the city of Ottawa. Every one in the lumber industry is more or less familiar with the importance of this firm and the remarkable development which it has undergone. No one however, can even remotely appreciate the enormous activities of this company, or the wonderful equipment which it has assembled, without visiting the plant and seeing all its facilities for the production of high class material of every variety manufactured from lumber. The first impression which one secures when visiting this plant is that of the infinite pains and care which have been given to the securing of permanence and stability in connection with all the buildings in which the numerous departments are housed. It would be impossible, short of publishing a very large book, to give a description of all these departments. The object of this article is rather to touch upon a few outstanding features so as to give a descriptive impression of the whole.

Plant of W. C. Edwards & Co., Ltd., New Edinburgh, near Ottawa, Ont.

The wood working plant at the New Edinburgh mills is housed in a solid reinforced concrete and brick building, being as nearly fireproof as engineering skill and money can make it. In the sash and door and interior finish factory alone, employment is afforded for between seventy-five and one hundred skilled mechanics, who are receiving the highest wages obtainable for first-class workmanship. The raw material upon which they operate includes red and white pine, birch, red oak, plain and quarter cut oak, ash, beech, maple, and basswood. These are all carried in stock, and the firm also import in large quantities of such woods as mahogany, walnut, teak, red gum, cypress, yellow pine, whitewood, white oak, plain and quarter cut oak, etc., which are used in the production of high class interior finish.

Among the productions of this plant are included a great deal of the choicest lines of hardwood finish for interior office, house, bank, church and railroad stations work; notable examples of the output being the interior work done in the Chateau Laurier, The Grand Trunk Railway Station, the A. E. Rae Company's Building, the Ottawa Journal Building, the Roxborough apartments, etc.

The Door Department

One of the most interesting branches of the plant is the door department where doors are manufactured in every variety of finish. The cores are built up with extreme care, so as to eliminate warping, shrinking, or twisting. Only men of exceptional experience are employed in this work, which also requires the best material obtainable, and the latest improved machinery. All the veneers, which are used in door production are selected with extreme care for their color and grain.

On leaving the interior finish factory one notices immediately the sprinkler system installed throughout the yard, store houses and buildings. Wherever there is any danger of freezing, or where climatic conditions would render the wet sprinkler system unsuitable, the compressed air system is used. In fact every practical means has been adopted for fire prevention. Not only is the plant equipped with an efficient sprinkler system, but one comes across hydrants, installed at important points for fire prevention. The Dominion Signal and Messenger Service is also installed by means of which a watchman is telephoned to in case he is fifteen minutes late in ringing in any station. This insures that every department shall be inspected by the watchman once an hour.

In the planing mill, which a visitor would probably inspect after passing through the interior finish factory, there are located five planers, a power trimmer, self-fed rip saw, edger, and various other types of saw and filing equipment. Beyond the planing mill is located the boiler house, an extensive building, which is kept spotlessly clean. It is equipped with twenty-four boilers. The blower system from all the sawdust and shavings producing departments feeds these boilers automatically. Cables circulate the sawdust and shavings so that they are fed to the rows of Dutch ovens connected with each boiler. The boiler house is constructed of concrete. Passing from the boiler house to the electric power house, one sees five dry kilns of the latest design, and next comes the large electric shop for maintaining and caring for the electrical appliances.

The Power Plant

In the power house a descent is made to the foot of the falls, where the turbines, generators, and steam auiliary plants are situated. Here the water takes a forty-foot drop and operates the turbines. Two turbines are already working in connection with two electric generators of 1,500 h.p. Another turbine is to be installed, and the plant also has a steam auxiliary. In the condenser house further means of fire protection is installed in the form of a Worthington pump which is capable of pumping one thousand gallons a minute.

Next, one comes to the Hardwood Flooring factory, located near an extensive shed in which all kinds of dressed lumber are stored. In this plant every variety of first-class flooring is produced.

Another large section of the plant is the box factory, where all sizes and shapes of box shooks are produced. The equipment of this plant includes printing presses for marking boxes with the purchaser's label. Over eighty men are employed in the box factory alone. Recently, a large bright and commodious building has been added to the group, to be used as a cutting-up mill. The lumber enters this mill in the rough and is cut into the various sizes required for the box factory and the sash and door factory.

One of the most interesting features of the whole plant is the extensive stabling equipment, which provides accommodation on its two floors for almost one hundred horses. On the top floor of the model stable, a special feed for horses is manufactured from cut hay, crushed oats, and molasses.

A short distance from the stables are located the machine shops, the blacksmith shop and forge, and carpenters' shop. These are all situated on what is known as Green Island. On this, the Ottawa side of the Rideau River is located the saw mill, where the logs are brought to be converted into lumber, and hauled to the various lumber yards surrounding the mill and piled ready for shipment.

Canadian Forestry Convention Postponed Indefinitely

Owing to the war, the president and directors of the Canadian Forestry Association have decided to cancel the arrangements for the forestry convention which was to be held in Halifax, September 1 to 4, 1914, and to postpone the convention indefinitely. The situation is such, that it is felt to be best to leave the matter open and to state that whatever it is decided to do in the future, due notice will be given to the members and all others concerned. All railway arrangements as published have been cancelled and anyone going to Halifax within the stated dates will have to pay full fare back to starting point.

Modern Logging Methods in Ontario

Felling a Pine near Trout Creek, Ont.

The accompanying illustrations give an excellent idea of the logging operations carried on in connection with a mixed stand of hardwod and softwood in Northern Ontario. The location of these operations is a few miles out of Trout Creek, Ont., where the Trout Creek Logging Company are taking out logs for the Ballantyne Lumber Company, Trussler Bros., Limited, and the Dominion Wood and Lumber Company, all of which have offices in Trout Creek. One of the illustrations shows a crew which has commenced work upon the felling of a typical pine tree on these limits which contain an excellent stand of high grade pine.

A very interesting illustration is one showing the method of loading from a skidway on to a car running upon the logging track which the company have built into the limits from Trout Creek. The loading of the car is effected by means of a loader operated by an engine consuming coal oil. This engine has a capacity of 4 h.p. and is started with gasoline, after which coal oil is used. The engine was made by The Fairbanks-Morse Company, and the loading device was made by Woodside Bros., Port Arthur, Ont. This device consists of an arm hoist operated by a cable and drum, a chain and a sprocket wheel on the engine are attached to a small sprocket on the drum. The hoist arm lifts the load from the skidway and deposits it upon the car. As soon as the log is hoisted a trip comes into action, releasing the log and leaving the arm free to be returned to the skidway for another log. The company own an equipment of Russell logging cars which are used for this prupose.

Another illustration represents the Heisler Logging Locomotive operated by the Trout Creek Logging Company drawing two cars of logs out of the woods to the plant at Trout Creek. At Trout Creek, these logs are dumped into a log pond which is kept open during the winter by means of exhaust steam from the plant.

After the timber for the saw mill has been removed from a portion of the limits, gangs of Italian workmen are sent into the bush to remove the cordwood. This is loaded on to the cars and is brought out and piled at the chemical plant, to be manufactured into different products, such as charcoal, alcohol and acetate of lime.

Object to Vancouver Harbor Rates

Lumbering interests of Vancouver, B.C., appeared before the harbor commission recently to protest against the schedule of rates that has been announced. This is Vancouver's first harbor commission, it being a federal appointive body to look after the harbor, which has been made a free port. The object of the charges is to make the harbor at least part sustaining and the schedule includes charges that apply to everything for which the harbor is used. The lumbermen are not the only persons protesting, but, in the end it is believed that the charges will prevail without a great deal of modification. They have been based on charges in other ports and will be made as equitable as possible under the circumstances. The lumbermen made the claim that they can not submit to more charges and remain in business. It was pointed out that operation is very costly, especially in view of present conditions, and the margin of profit is so little that it is hardly good business to run the mills. The additional charges will be the last straw. Although it was not stated before the commission the levy will mean between $8,000 and $9,000 annually to such a plant as the Hastings mill and will be felt especially by the smaller concerns. The discussion was conducted with equanimity on both sides and it is felt that a satisfactory settlement will be reached in the end.

The Importance of Sufficient Power

Editor Canada Lumberman: Westboro, Ont., Aug. 3.

I think there is no subject which requires the attention of the lumber manufacturer to-day, more than the power they use, to drive their machinery.

I will give you my recent experience with a 6-foot band mill. This mill is said, by band mill experts, to be as good as any made. It was driven by a 14-in. x 18-in. engine, running 200 revolutions per minute. The engine drove the jack chain also, which brought in logs to supply the twin circular, siding cants for a gang, along with the logs for the band mill. The jack works were 150 feet long from the mill to the water and had an elevation of about 60 feet. You will see by this that the jacking of the logs used up considerable power, and furthermore caused the power to be variable, as the jack chain was not working all the time. When it was running the speed of the engine was reduced, and, of course, the speed of the band saw in proportion. The speed of the band mill was 10,000 feet per minute, but it did very inferior work, both in quantity and quality. To help matters the speed of the band mill was reduced 1,000 feet per minute, by placing a smaller pulley on the shaft driving the band mill. The change made a great improvement, for, with the same filer and the same saws, more lumber and much better lumber was sawn.

Often the saw fitter is blamed, as in this case, for not fitting the saws properly, when the whole trouble is caused by unsteady power, for there is no saw that will give good results with an unsteady power, especially a 6-foot band mill saw of 16 gauge.

When there are so many band mills in use, as there are to-day, I think the lumbermen should look more carefully into the question of power. A few hundred dollars expended on the power plant in more power than can be figured out to be necessary, will often bring in thousands of dollars after the mill is in operation, for I find that the ratio of power in the modern sawmill has not increased with the ratio of speed, in the last 30 years. The modern mill of to-day is not doing as much work as it would if it had sufficient power to keep the saws running at uniform speed. This letter is written, not from theory, but experience.—I N. Kendall.

Increasing Protection of Vancouver Timber

Further steps towards the protection of the timber on Vancouver Island, where very valuable timber is to be found, are being taken by the forest branch of the British Columbia Department of Lands. The telephone service is being greatly extended and will be not only of value to the department in the summoning of assistance in cases of fires in the timber but in case of accidents in logging camps.

Loading Log by means of an Oil-Burning Loader

Logging Locomotive in use at Trout Creek, Ont.

St. John Exports of Lumber

Exports of lumber and lumber products for the year ending June 30th, 1914, from the American Consular District of St. John, N.B., according to statistics furnished by the American vice-Consul at that point were valued as follows:—

Product	September 1913	December 1913	March 1914	June 1914	Total
Lumber	$259,712.29	$155,058.54	$ 69,102.34	$237,562.37	$721,435.54
Pulp Wood	24,872.54	25,397.50	.....	32,282.36	82,552.40
Wood Pulp	62,812.44	105,097.56	94,527.53	151,206.25	413,643.78
Laths	52,094.61	65,354.23	16,108.93	80,403.35	213,961.12
Ships' Knees	348.50	948.15	.....	594.55	1,891.20
Pine Boards	2,717.59	10,773.44	1,192.33	4,592.12	19,275.48
Telegraph Poles	2,067.30	.....	.....	.....	2,067.30
Shingles	.....	6,748.50	9,237.14	15,754.31	31,739.95
Staves	1,022.13	.....	2,408.04	.....	3,430.17
Track Ties	.....	762.32	2,679,64	9,114.02	12,555.98
Total	$405,647.40	$370,140.24	$195,255.95	$531,509.33	$1,502,552.92
During the preceding year the totals were as follows:					
Total	$689,914.82	$484,975.28	$297,539.34	$453,132.61	$1,925,562.05

New Lumber Company Located in Windsor, Ont.

The Windsor Lumber Company is a new firm which is making rapid progress and is helping to make Windsor, Ont., a greater and more prosperous city. The yard takes in six acres, well situated for convenience. The company have 600 feet of railroad siding, giving them 1200 feet of poling space where materials can be easily and quickly unloaded from the cars. A splendid shed is located in the yard for storing materials, and is arranged for efficient service. Selections can be made from the shed without delay, for good service is the chief aim of the company.

A modern mill will be erected, in which will be installed the most modern machinery driven by individual motors, as soon as the Hydro system is in use, which will supply them with the necessary power. In the meanwhile, they have the call on four of the largest mills in Canada, one of which is in Essex county.

The company are seeing their business grow each day. They have just received the contract for all materials in their line that will be used on the new Wyandotte Street School, that will cost approximately $79,000; also the new three-storey Michigan Central Hotel, a modern structure which is now being built near the Tunnel Station.

Mr. "Jim" Scofield, the manager, is a product of Canada. He was born in the thriving town of Woodstock, and following the natural tendency of his father before him he "broke into the lumber business while still a boy, and has made this calling his life study. After going through the minor details of the business, he branched out and went to Pittsburg, where he associated himself with the widely-known Paine Lumber Company, manufacturers of veneered doors and interior finish. Through his early training and keen foresight he soon gained a substantial footing with this company, spending six years at Pittsburg as manager of their jobbing house, and four years as branch manager of their Detroit office, where he looked after the entire Canadian end of their business. Severing his pleasant relations with that company he became manager and part owner of the Windsor Lumber Company.

There are very few men who enjoy the distinction of having as many friends throughout the country as Mr. Scofield. Since becoming a fixture in Windsor the power of his personality has been felt by all who have come in contact with him. He possesses that valuable trait in busy men of being an optimist. Mr. Scofield is an active member of the Windsor Board of Trade and a valued member of the Builders' Exchange.

J. R. Eaton & Sons' Fine New Plant

J. R. Eaton & Sons, Orillia, Ont., whose planing mill was destroyed by fire last year, have under construction a modern and up-to-date factory building, which when completed will be fully equipped to take care of their large trade in flooring, doors, and all kinds of interior finish.

The main building of the new plant is 151 x 304 feet, one storey high, full mill construction, with boiler and engine room and dry kilns attached. The walls of the main building are being built of Denison

New Plant of J. R. Eaton & Sons, Orillia, Ont.

Interlocking Tile, manufactured by the Sun Brick Company, Limited, of Toronto. This material was chosen as being specially suitable for a building of this nature. It makes a light wall, a cool building in the summer, a warm one in cold weather, and an absolutely dry one. It is of fireproof construction and above all has a first-class appearance.

A new feature in this building is the chimney stack built by the Alphons Custodis Chimney Construction Company, of New York, whose Canadian office is in the Confederation Life Building, Toronto.

Canada's Exports and Imports of Wood Goods

Canada's exports of forest products during the twelve months ending with April 30th, 1914, were valued at $42,797,161. During the years 1913, 1912, 1911, the values were respectively as follows:—$43,646,733, $40,717,190, $45,191,680.

The imports of wood and manufactures of wood during the twelve months ending April, 1914, were valued at $23,215,024. During 1913 the value was $28,398,740.

The exports of wood and manufactures of wood from Canada during the twelve months ending April, 1914, and during the corresponding period in the previous year were as follows:—

	1913	12 months ending April total	to U. K.	to U. S.
Lumber—Deals, pine	1,395,255	1,390,086	1,311,401	53,918
Deals, spruce and other	5,581,499	6,466,999	5,874,926	501,150
Laths, palings and pickets	2,038,933	1,895,812	23,905	1,839,107
Planks and boards	20,904,269	19,531,256	1,771,042	15,253,654

A New Lumber Company at Windsor, Ont.—Yard and Shed of the Windsor Lumber Company

The Pulpwood Industry in New Ontario

Timber Resources the Backbone of Northland's Future Prosperity—Great Opportunities Waiting for the Arrival of the Railroads

By Horace A. Bell

IF New Ontario is to be developed as rapidly and as successfully as its well-wishers desire, it will undoubtedly be through the pulp-wood industry that this end is achieved. When the project of converting these vast tracts of forest into agriculaural land was first taken up the glamor and excitement which attended the discovery of silver in Cobalt, and gold in Porcupine, did much to make the general public overlook the potentialities of the timber resources of this new portion of the province. They were more interested in the minerals which prospectors were disclosing beneath the soil than in the wealth which was apparent on the surface. The fortunes which were being made from a few blows of the pick appealed to them more than did the possible revenues from the timber lands when transportation facilities should provide the necessary market.

However, although the mines of the North served a useful purpose in advertising the possibilities of the area which the Ontario Government were seeking to develop, the fact should not be forgotten that when Cobalt and Porcupine have ceased to exist, the pulp-wood which exists in such abundance over the whole of the Clay Belt, will be bringing in a considerable revenue to the provincial exchequer. The exploitation of the pulpwood will be the means of enabling the settler to clear his homestead profitably, and convert his holding, as the Government desires, into a paying farm.

Whilst the attitude of the average citizen in this matter may have been one of more or less indifference, the importance of the subject from the outset has been by no means lost sight of by the wealthy lumber interests of Canada and the United States. As soon as the cutting of the right-of-way of the Transcontinental Railway made the adjacent townships accessible, these concerns had men out travelling the bush searching for those areas where the timber was most suitable and most abundant, and for locations for mills where the material could be most profitably marketed.

Although only a few of the schemes which these men set out to investigate have actually materialized, with the possibility of a few others being consummated at a later date, the reports turned in were invariably laudatory of the excellence of the pulpwood throughout the whole area. It was a case of

"How happy I could be with either
"Were the other fair charmer away."

Waiting For the Railways

There are millions of acres of the finest spruce and balsam to be found in any part of the province right within easy access of the Transcontinental Railway; but, until that great Government undertaking is finally opened up, those who may have the erection of mills in contemplation are hardly likely to complete their plans, or attempt to instal their plant. Contractors' trains are all very well in their way but they afford neither the service nor the rates conducive to the profitable working of so costly an equipment as that of a pulp mill.

Although the construction of the Transcontinental Railway has done much for the encouragement of the pulpwood industry in Northern Ontario, and new mills are likely to be started, even if branch lines are not established in the near future, it is the opinion of many people competent to judge that the truly ideal site for a pulp mill will not be accessible until the Timiskaimng and Northern Ontario Railway is extended to James' Bay. This site would be at some spot on the Moose River a hundred miles north, more or less, of the Transcontinental Railway.

All the rivers north of the Height of Land flow northward and converge practically at one point. Amongst the more important of these waterways are the Abitibi, the Frederickhouse, the Driftwood, the Mattagami, the Ground Hog, the Kapuskasing, and the Opasatika. A number of smaller streams flow into these larger rivers, in fact the railway west of Cochrane crosses large and small streams at very frequent intervals. In the vicinity of these rivers there is an abundance of pulpwood which could be floated down at a practically nominal expense to the mill, erected where the rivers converge.

Moose River an Important Factor

The freight charges on pulpwood shipped from the Cochrane district to the mills in Northern New York amount to eight dollars a cord, whilst the freight to the mills at Thorold is $6.50 per cord. It is claimed that logs could be driven down the rivers to a mill on the Moose River at a cost of a few cents a cord. As against this there would be the extra cost for hauling the manufactured pulp the extra distance from the mill to Cochrane but this would be infinitesimal when compared with the cost of shipping the raw material to the old-established mills of the continent.

Even under present conditions the establishment of supply and other camps could be very easily carried out in locations of about a day's journey from the railroad, so that the men and the officials would be in fairly intimate touch with the outside world. In this connection it is interesting to note how camps, which a few years ago were isolated from the outside world, have been brought, through the instrumentality of the railways, almost into the midst of civilization itself. In regions where ten or twelve years ago mail was received once or twice a month at the most, it comes to hand at least once a week, and in many cases more frequently.

One great advantage which a mill on the Moose River would have would be that settlers would be able to haul the logs, which they have cut in the process of clearing their land, down to the rivers in the winter time, and have them floated down to the mill when the ice goes out in the spring. With so many rivers flowing northward to the one central point the settler whose land was not in the immediate vicinity of a river would in no case have a very long haul to deposit his logs upon the ice. The complaint of the homesteader along the Transcontinental Railway hitherto has been that the Abitibi Pulp & Paper Mills have been established south of the railway. There is a market for their pulpwood there, but the only way to get it to those mills is by rail, and when the freight charges of the railroad contractors have been paid there is not much left for the settler himself.

An Inexhaustible Supply

It does not require an eypert to say that the pulpwood supply which could be sent to a Moose River mill is practically inexhaustible. This is obvious to any one who has travelled over the Transcontinental Railway for any distance west of Cochrane. However, until the construction of a line to James' Bay has been definitely decided upon, the Moose River Mill scheme must remain very much in the air.

Although this is considered an ideal location there are many others admirably adapted for pulp mill purposes.

The industry is merely in its initial stages at the present time. The advantages which the country offers for the profitable manufacture of pulp are manifold. With so many important rivers within a few miles of each other the question of power is solved at the very outset. The supply of the raw material is, as has already been said, almost inexhaustible; whilst the question of transportation, when the railway is opened for traffic, should no longer hinder those interested in the business from establishing their plants.

The firm to whom the credit must be given for first embarking upon an enterprise in connection with the lumber business, upon an extensive scale, in the newest North, is Messrs. Jackson & Tindle, of Buffalo, who formed the New Ontario Colonization Company, and acquired the townships of Kendry and Haggart, and now have large saw and planing mills in operation at Jacksonboro, on the Mattagami River, thirty-two miles west of Cochrane. It was at Christmas, 1911, that they first sent their representatives up to explore the bush at the point where the Transcontinental Railway crosses the Mattagami River, and so favorable was the report sent in that the following spring the purchase of the townships from the Government was carried through. Although a pulp mill is not part of their scheme, they are shipping considerable quantities across the border, and this portion of their business, is likely to be largely increased when the opening of the railway affords greater facilities.

It was not long after Messrs. Jackson & Tindle had established themselves at Jacksonboro that the announcement was made that big pulp and paper mills were to be erected at Iroquois Falls, a few miles from the main line of the T. & N. O. Railway, by the Abitibi Pulp & Paper Company. Work upon this undertaking, which easily ranks as the biggest enterprise in the North Country, has been in progress for many months, and at the time of writing, the works have just been put into actual operation.

Wealthy Syndicates Spying the Land

Although these are the only concerns at the preesnt time engaged in the pulpwood industry in the new district, it is known that other wealthy syndicates are casting longing eyes on the vast timber areas of the district; and the announcement of an enterprise even more ambitious than that of the Abitibi Pulp & Paper Company has recently been made. The most profound secrecy was maintained in regard to this scheme, and although several men were away in the bush for the syndicate all last winter, they observed a discreet silence when approached on the subject of the intentions of their principals. The ubiquitous newspaper man was unable to "draw" them in any particular.

In spite of every precaution, however, certain details leaked out in various ways which can be banked upon as correct, and it is now

officially announced that the mills will be located at Smooth Rock Falls, about three miles from Jacksonboro, and that both pulp and paper will be manufactured on the spot. Indeed, engineers have been engaged in running a line for a spur into Smooth Rock from the Transcontinental Railway. It is known, too, that the representatives of the concern have been securing all the available veteran grants in the vicinity, and these together with the land over which they have secured from the Government the right to cut pulpwood will amount to 21 townships at least. It is also said on very good authority that about twelve hundred men will be permanently employed on the works and in the bush. Mr. Duncan Chisholm of Toronto is the chief representative of the new undertaking.

As we said at the outset of this article, the rapid development of the North Country is largely dependent upon the industries which the wealth of its timber resources will create. The mines are only an incidental and temporary aid. It is as an agricultural area that its ultimate success will be assured; and it is the timber which will enable the settlers to convert the district from virgin forest to fertile farm land.

The Homesteader's Position

The average homesteader is not over-burdened with capital; and the only way in which he can obtain some measure of return for the time and labor which he devotes to the clearing of his holding is by finding a market for his pulpwood. Under the most favorable conditions it must take three or four years for him to clear sufficient of his land to render it capable of producing a crop which would bring in sufficient money to maintain himself and family in the most humble manner; and it is imperative that he should have some means of securing an income, however small, during the time he is getting his homestead in readiness for a crop. The establishment of pulp mills will help him to solve the difficulty, and although he claims the prices at present offered him for his pulpwood are by no means an adequate return for the labor he has spent upon it, he is better off by selling it at a very small margin of profit than by burning it as he cuts it.

Great Britain's Imports of Timber

Great Britain's imports of timber during the first five months of the current year are approximately $6,665,940 less than during the corresponding period of 1913. All descriptions of wood, with the exception of mahogany, show a marked decline, as will be observed from the following analysis:—

	Loads	Value £	
Hewn	112,570	564,539	(decrease)
Pitprops	127,324	175,379	(decrease)
Sawn	340,496	1,205,897	(decrease)
Staves	12,204	72,673	(decrease)
Mahogany	36,510	288,058	(increase)
Unenumerated	15,496	41,245	(increase)

The decline of imports from Canada is: hewn, £10,940; and sawn or split, planed or dressed, £122,260.

Great Britain's imports of manufactured wood, i.e., furniture and cabinet ware, house frames, fittings and joiners' work, woodware and wood turnery decreased in value £164,846.

Proposed Canal Toll Will Affect Lumber Trade

In the opinion of Captain Robert Dollar, one of the most prominent ship owners of the Pacific Coast, the present controversy between shipping men and President Wilson of the United States in regard to taxing owners and charterers for deck load cargoes of lumber through the Panama Canal, will greatly affect the province of British Columbia, whose resources of timber are so abundant.

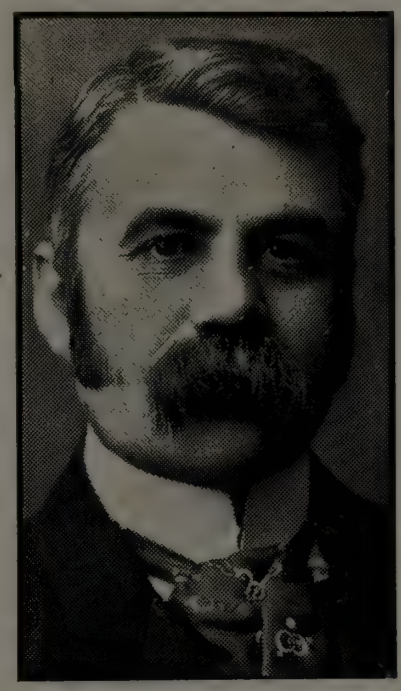
"The ship owners pay tax upon the tonnage of their ships, and it does not seem right to us that lumber—the only cargo which is carried on deck to any extent—should be imposed upon by an extra charge," said Captain Dollar in an interview.

"At least one-fifth of a ship's cargo of lumber is carried on deck, and it is not fair that lumber carriers should be made the particular object of this ruling. British Columbia's future depends greatly on the lumber business, and, should President Wilson decide against the owners of vessels in this matter and charge for deck loads passing through the canal, the effect is evident. The business through the canal will be big when it opens. We ourselves intend to send all our ships through, and are here to handle a large amount of the lumber business with the eleven ships which we own and which are registered and operated from the port of Victoria. I wrote to President Wilson that I could not see why extra for deck loads should be paid, so long as I paid my full tonnage, for it makes no difference on other ships whether they carry feathers or pig iron."

Captain Dollar has taken this matter up with the Chamber of Commerce at San Francisco and at other Pacific Coast points, and these bodies are with him and the ship owners in the fight for this privilege. Captain Dollar expects to win, and is anxiously waiting for a reply from the Chief Executive of the United States. The cargo of lumber on the steamer Robert Dollar, of course, has not gone through the Canal, as was originally intended, but it is certain that all the remaining cargoes will do so, commencing next year.

Captain Dollar has been at Genoa Bay, B.C., on business with regard to the contract to carry 25,000,000 feet of lumber from Vancouver Island to Toronto, via New London, Conn., where it is to be loaded on to trains. The steamer Robert Dollar has already left Genoa Bay with the first cargo of 5,000,000 feet. This is the largest cargo of lumber ever carried from the west coast of America to the East in a ship, according to Captain Dollar.

Sudden Death of Hugh Scott Brennen



The late Hugh S. Brennen

The sudden death of Mr. Hugh S. Brenner, senior member of the firm of M. Brennen & Sons, Hamilton, Ont., came as a great shock to his many friends in the lumber industry. Mr. Brennen was found dead in his bed at the Brant House. Burlington, Ont., on July 31st. He had been spending the summer with his wife and family at the Brant House and had been in his office in Hamilton on the day previous. He was apparently in excellent health and it is stated that death was the result of appoplexy.

The late Mr. Hugh Scott Brennen was the second son of the late M. Brennen, founder of the lumber firm which bears his name. He was born in Hamilton and was educated there and at the University of Toronto, from which he graduated in 1880. He immediately enterd his father's office to assist in the management of his rapidly increasing business. On the death of Mr. M. Brennen, Mr. Hugh S. Brennen and his brothers succeeded to the business.

The late Mr. Brennen took an active interest in the welfare of the City of Hamilton, devoting his attention especially to educational matters. He was a member of the Board of Education for twenty-six years, and served as chairman for one term. He was an active church worker, giving much of his time to the affairs of Knox church, on the Board of Managers of which he served one term. Of late he had been associated with the affairs of St. Paul's church. His interest extended also to philanthropic work, to which he gave much of his attention and means. Mr. Brennen was well-known in fraternal circles, having been connected for many years with the A. F. & A. M. He was Past-master of Temple Lodge. He was also a member of Scottish Rites bodies of the order, and a member of the A. O. U. W.

He is survived by Mrs. Brennen, who is a daughter of the Rev. Dr. A. B. Simpson, of New York, a former pastor of Knox Church, Hamilton, and by two daughters, five brothers and two sisters.

Belleville Lumberman's Death

Mr. Harry Pringle, one of Belleville's prominent citizens, died recently after an extended illness, at the age of 56 years. He was prominent in political, social, church, and educational matters. He was twice the Liberal candidate for Legislature honors in West Hastings, was for years a member of the Board of Education, Past Grand Master for the Masonic Fraternity for the city, a member of the Senate of Albert College, and a member of the official board of Bridge-Steet Methodist Church. Mr. Pringle was the head of the Pringle Lumber Company, of Belleville. A wife and one daughter, Mrs. Rev. Bruce Hunter, survive.

Quebec Cullers Report

The following comparative statement of timber, measured and culled to date is furnished by the Supervisor of Cullers' office, Quebec, under date of August 6.

	1912. Cubic Feet	1913 Cubic Feet	1914 Cubic Feet
Waney White Pine	685,320	213,920	481,560
White Pine	80	7,560	.....
Red Pine	1,320	960	1,040
Oak	10,280	105,920	290,280
Elm	274,880	194,000	299,280
Ash	120	1.000	680
Birch and Maple	38,640	47,680	50,800

Pioneer New Brunswick Manufacturers

The New Addition at Fredericton to the Sawmills Operated by Fraser Limited—Modern Lumber, Shingle and Lath Producing Plants

By Don. A. McDonald and R. B. Miller, M. A., M. F.

THE firm name of D. Fraser & Sons, now Fraser, Limited, has long been identified with the lumbering interests in New Brunswick and is synonymous with square dealing, solidity and a progressive spirit. Donald Fraser, Senior, with whom are now assosiated his sons, Archie and Donald Fraser, Junior, is one of the pioneer lumbermen of New Brunswick and he is proud of the fact that his apprenticeship began in the woods, when as a young man, without capital, he first came to this country and began at the bottom. To this fact can be attributed, not only an intimate knowledge of all phases of the business, but the experience and sympathy in handling labor, which has made the firm name known in the remotest regions of New Brunswick and Quebec.

Beginning of the Business

With his early savings, Donald Fraser, Senior, began contract sawing and started a mill at River de Chute, later building the Aberdeen mills just above the city of Fredericton, which were burned about 1901, after successful operation for twenty years. The Frasers then turned their attention to mills at Plaster Rock, N.B., and Cabano, Quebec. They have also established mills and stores at Edmundston, N.B., at Baker Brook and elsewhere. Their holdings comprise private lands in both the provinces of New Brunswick and Quebec, Lands are under lease from both provinces and from the New Brunswick Land Company. "Bank" logs are also purchased from farmers all along the St. John River to supply the Victoria Mills, at Fredericton. The latter mill is further stocked from the lands originally owned by the Scott Lumber Company, which were cruised and purchased by Fraser, Limited, in 1912. This mill, known formerly as the Scott mill, was located about a quarter of a mile below the Phoenix mills and a half mile below the city of Fredericton. Since its acquirement the mill has been entirely remodelled and equipped with the most modern machinery for manufacturing lumber, lath and shingles, while a planing mill and box factory have recently been added, making it one of the most modern mills on the St. John River. For this reason it is especially interesting to forestry students and was selected as the subject of a milling report for Seniors in Forestry in the University of New Brunswick last year. Visits to this mill, have given them an idea of the best and most up-to-date machinery for manufacturing lumber, with the least amount of waste. Around this mill has sprung up a little community known as Victoriaville, just below Morrison's, on the C. P. R. and Valley Railways, and the future will probably witness many changes in this locality inaugurated by the firm for the welfare of their employees and the upbuilding of this little manufacturing centre.

In the scope of this article, a detailed history of the growth and changes wrought by Fraser, Limited, at all their different mills, would be impossible. The business which has sprung up at Cabano, Quebec, might be taken as fairly typical of what has been accomplished in other localities by this firm.

Thoroughness and Enterprise

Starting at St. Rose station, on the Temiscouta Railway, you can portage to Big Squattuck Lake, and at the head of this lake, or a brook coming into it, you will find the first logs which are to feed the Fraser mills at Cabano, Quebec. Through this chain of lakes, bordered by a finely timbered region, you can travel by canoe through Touladi River and Touladi Lakes, a distance of 90 miles, before you come into Lake Madawaska—and through all this distance you are impressed with the Fraser thoroughness and the Fraser enterprise which guides these logs unerringly, through dams and rafting works, to their final destination—the saw and the manufactured produce. If you wish a further trip, you can travel down the beautiful Lake Madawaska, through the quiet stretches of Madawaska river until you reach the town of Edmunston and another Fraser mill, just above the entrance of that river into the St. John. If you are short of grub on this trip, you can be assured that at any of the Fraser stores where you stop you can get the best which the market affords and receive the most courteous attention, with advice as to portages and camping sites. This has been made possible, not in a few years or by slight effort, but as the result of a lifetime's application of careful and conservative business methods in this region.

The company now have beautiful and commodious offices in the Royal Bank building, at Fredericton, and from here the main business is conducted. The members of this firm are modest men who do not seek publicity, so that facts concerning the upbuilding and growth of their business must be secured largely from outside sources. They are further, busy men, and not always easily found, since they must travel extensively to look after their interests at their various mills. Many of their employees have been in the service of the company for years and are trusted largely to supervise their share of its interests and the loyalty and devotion of these men who have grown gray in their service speaks most eloquently of Fraser honesty and the Fraser spirit.

The following report of the Victoria Mill, at Fredericton, was written in the fall of 1913 by Don A. McDonald, a Senior in Forestry in the University of New Brunswick, following an outline used for lumbering reports suggested by Prof. R. C. Bryant, professor of lumbering in Yale University. The difficulty encountered by inexperienced men, unfamiliar with mills and milling machinery, can well be imagined, even the practical mill man would find it no easy task to write a milling report. In the report, the writer is greatly indebted to the manager of the mill, Mr. William H. Glenn, for information furnished, and for explanation of machinery. Mr. Glenn, before being selected as manager of the Victoria Mills by the Frasers, was for several years in the employ of Randolph & Baker, as a scaler and cruiser and in the office and the booms of the St. John River Log Driving Company. He knows from experience just what logs with various defects should saw out, and having acquired intimacy with the mill end of the business and a familiarity with the Fraser methods, is one of the most efficient managers the company could secure.

The Victoriaville Plant

The plant of Fraser Limited, at Victoriaville, is equipped with the most modern machinery available and includes a sawmill, shingle mill and lath mill. A planing mill is also being erected. Operations were commenced during the summer of 1913, the principal species of timber being spruce, cedar, hemlock, fir and a small amount of pine. Like nearly every other large operation in eastern Canada the sawing season for this company begins in May, when the ice in the river breaks up and logs can be obtained. Sawing continues throughout the summer and until the river freezes, which generally occurs sometime in November. In order to make sure of commencing operations early in the spring, a supply of logs is obtained by skidding from the

Victoria Mills, Fredericton, N. B.

The Log Pond, Victoria Mills, Fredericton, N. B.

pond to the bank by means of a steam donkey and a drum. Then the logs are piled up by a steam derrick, sufficient being provided in this manner to keep the mill operating from the time when it is started in the spring until the first logs from along the river can be sorted and run into the pond. For securing its regular supply of logs, the company is very conveniently situated near the booms of the St. John Log Driving Company whence logs can be obtained with little delay. Most of the logs used are known as "bank logs" taken out by farmers along the river.

The situation of the sawmill is not only convenient from the point of view of securing the logs, but also from the point of view of shipping the finished product. Short spurs of railway connect the yard with the C. P. R. and the St. John Valley Railway. Shipment may also be made in vessels or scows to St. John as the river is navigable up to this point for vessels of ordinary draft.

The log pond, situated along the bank of the river is 1½ miles miles long and 200 yards wide. The usual booming and log elevating equipment is installed. When the logs enter the mill they are carried by live rolls to a cut-off saw rising up through the floor which cuts them into the proper lengths. The log deck which receives the logs when they enter the mill is 25 ft. long. The log elevator, live rolls and electric kickers are all controlled by levers operated by an employee who stands at the head of the elevator. Three log stops, operated independently of each other by floor trips prevent the logs from rolling off the inclined deck.

The next bit of equipment is the log carriage, which is 24 ft. long and 68 ins. wide. It is furnished with the latest equipment in the way of head blocks, knees, dogs, and ratchet set works. Two men upon the carriage operate the dogs which hold the log in place, and one of the men also sets the knees by means of a lever. The carriage is operated by gun-shot feed having a steam cylinder 40 ft. long and 12 ins. in diameter with a piston valve at each end. The sawyer controls the steam by lever.

The main band saw is a Simonds double-cutting band 45 ft. long and 12 ins. wide of 10-in. gauge and cutting a kerf of ⅛-in. This saw is capable of cutting 30,000 board feet of lumber at one filing and is changed twice daily. The band mill was furnished by the Waterous Engine Works Company, Limited, Brantford, Ont. The output of this mill is 60,000 to 80,000 board feet per day of 10 hours. In order to keep the plant running without interruption an equipment of six of these double-cutting band saws is kept on hand.

When operations were first commenced at this plant, it was equipped with a Mershon shingle vertical resaw. Deals coming from the main band saw can be passed through this and cut into 1-in. boards. During the spring of 1914 this resaw was replaced by a Mershon twin Saginaw band resaw. A full description of this was published in the Canada Lumberman of May 15th.

The mill is equipped with two edgers, each consisting of three movable circular saws 22 ins. in diameter, 8 gauge, cutting kerf of 3-16 in. These saws are vertically hung, and the distance between them may be changed to suit the width of the board.

The trimmer equipment consists of two circular saws 20 ins. in diameter, 10 gauge, cutting a kerf of 7-16 in. and operating at 1,500 r.p.m.

On leaving the trimmer the stock is carried by transfer chains to the sorting table outside the mill. This consists of a wooden platform 200 ft. long and 50 ft. wide, where the boards and English deals are sorted. Each size and quality is taken from the table and placed on trucks or wagons to be hauled to the yard. A crew of ten men, also one double team and three single teams are employed in moving stocks to the yard. The main yard has an area of 1½ acres and the average haul is about 500 ft. A spur track connects the sorting table with the yard.

Another spur track running alongside the sorting tables makes connection with the C. P. R., so that shipping by rail is greatly facilitated. Easy access is also obtained to the yard by locomotive shunters.

The company arrange their stocks in piles 16 ft. wide, usually from 15 ft. to 30 ft. high, and the piles are stacked with boards instead of regularly cut stakes. A space of 2 ft. is left between the piles, and the road through the pile is 20 ft. wide. On an average, each pile contains about 25,000 board feet. The work of piling is carried on by a crew of from 8 to 10 men.

Fraser Lumber Company's Plant—Plaster Rock, N. B.

Sawdust and Refuse Disposal

As in practically every other mill, an important problem is that of the disposal of sawdust and other refuse. Much of this is used in producing steam.

Slabs, butts, etc., are consumed in a large burner with a stack 95 ft. high and 36 ft. in diameter. A separate brick building houses the power plant and boiler room. This building is close enough to the mill to permit of belt drive from the engine to the mill. Power is supplied by a steam engine of 425 h.p., running at a speed of 150 r.p.m. The boiler equipment consists of 3 boilers of 150 h.p., 5½ ft. x 20 ft. and 2 boiler pumps 6 x 6 x 4. Steam pressure is carried at 125 lbs. per square inch. The boiler accessories consist of one water heater, 3 herring-bone grates, and a stack 100 ft. high. The grate surface in each boiler is 5½ ft. x 7 ft. The fuel consists of sawdust brought to the boiler room by a conveyor from the plant. The mill, blacksmith shop, etc., are lighted by electricity, supplied by a 25 kw. direct-current Edison dynamo driven by an 8-in. x 10-in. double cylinder Westinghouse piston valve steam engine, running at 150 r.p.m. This plant also supplies light for the mill yards. In all, about 150 bulbs of 16 c.p. each are used.

The water supply for the mill is brought direct from the river by a pump, passing into the boiler by way of a heater.

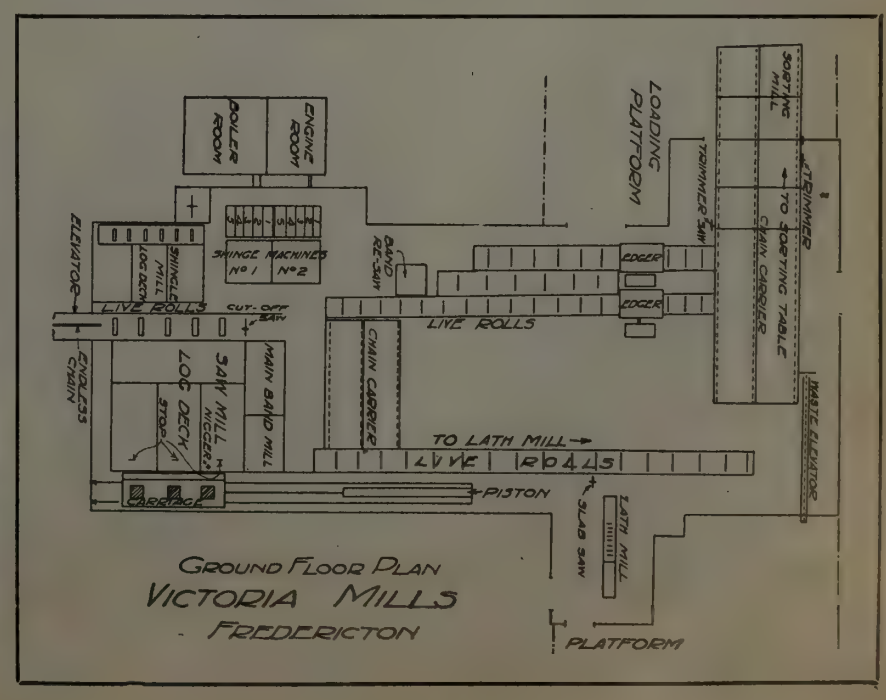
Across the road from the mill is located the blacksmith shop, the equipment of which consists of one forge, 2 anvils, work bench and vise, one set of dies and an upright hand drill. The blacksmith shop is also equipped with electric lights.

The wood working shop is situated on the ground floor of the mill.

Modern Filing Equipment

Particular attention has been paid to the layout of the filing room which is located directly above the main band mill. It has plenty of head room, is well lighted and is laid out and equipped in such a manner as to insure the greatest possible convenience in handling saws. The saws are raised and lowered to and from the filing room through trap doors, by means of a special wrought iron tackle, thus furnishing a very rapid and safe means of getting the saws on and off the mills. The filing equipment consists of one automatic circular saw grinder (Waterous), one Covel scarfing grinder, 2 Covel automatic band saw sharpeners, 1 set of shears, 1 brazing forge and 1 hammering bench. A small 12 h.p. horizontal engine (Leonard) furnishes power for the filing room machinery independently of the sawmill proper. Thus the filing room may be in commission at all times irrespective of the mill itself.

When logs are brought up the elevator and run along the centre of the log deck on live rolls, the cedar logs are thrown to the left and proceed to the shingle machines. Other logs are thrown on the log deck by means of the kicker. The logs which are too long are here cut by means of a cut-off saw having a diameter of 54 ins., gauge 6, kerf 1¼ ins. The log is then rolled down the inclined deck and comes to rest against the log stop. As soon as the log is needed the stop is "tripped" and the log rolls on to the carriage, where it is placed in



position by the "steam nigger" and clamped by the dogs. The double cutting band saw then slabs the log and converts it into deals. From the band saw the deals, or anything larger than two boards in thickness, are carried by live rolls to the resaw and the edger. Then by similar means they are taken to the trimmer and in addition to being trimmed are marked according to their size and grade. Then they pass to the sorting tables for assortment and transfer to the yard. The boards, on leaving the band saw, pass to the edger where wane and defect are removed. From then on, the boards go through the trimming and sorting tables to the yard. Edgings and slabs are dropped on conveyors, pass beneath the slasher saws which cut them into 4 ft. lengths and are then conveyed to the lath machine.

A small office building is located near the mill where the general manager conducts his business. He has under his direction a foreman of each of the different departments and he himself is directly responsible to the company.

According to a statement received from the company, the wages in the sawmill vary from $1.75 per day for pond men and yard men to $2.50 for edgers and teamsters. Sawyers get from $3 to $5 per day. The head filer, whose work is that of an expert upon whom the efficiency of the plant depends, receives a wage which would make an ordinary forester green with envy. For this reason the writer hesitates to state the exact amount.

The Shingle Mill

In the shingle mill, only one species of wood is used, namely northern white cedar. The logs for the shingle mill are conveyed to the log deck by means of an elevator and live rolls and are then kicked to the side opposite the sawmill log deck. They are brought to a halt by a log stop, and a vertical cut-off saw with a diameter of 5 ft., gauge 8, and ⅜-in. kerf converts them into bolts of the required length, which are then conveyed to the shingle machines.

The shingle cutting equipment consists of 2 "Dunbar patent" shingle machines. The shingle bolts are held in place by rolls automatically operated, so that the butt of the shingle is first cut from the bottom of the block and then from the top of the block. A lever beneath the sawyer's foot controls the shingle bolt carriage. The shingle saw is vertically hung and is a circular cross-cut saw 38 in. in diameter, 16 gauge, running at 1,600 r.p.m. This saw is changed twice a day. As each shingle falls from the saw, the sawyer takes it and trims it on the joiner or trimmer saw situated directly in front of him. In trimming the shingles he removes defects and then tosses them into compartments according to their grades. Sawdust and refuse from the shingle saws drop into chutes which dump them upon conveyors for delivery to the furnace room or to the refuse burner.

The joiner or trimmer is a vertically hung rip saw 35 ins. in diameter, 17 gauge, running at 1,400 r.p.m. and is changed once daily.

The shingle grading boxes are located directly in front of the sawyer, and at the lower end of the boxes the shingle bunchers work. The buncher opens a compartment containing a certain grade and proceeds to bunch all the shingles in the compartment. After finishing a grade he takes another compartment. The shingles are bunched in a box 10-in. x 20-in. x 27-in., having hinged end, half open bottom and a moveable upright at each side. First, a binder cleat is placed across the bottom. Then the required number of shingles (250) are placed in the box and another cleat is placed across the top of the bunch at the centre. The two cleats are then tied tightly together with tarred shingle yarn. Completed bunches are removed from the rig and marked with stencils indicating the maker's name and the grade. Each buncher keeps tally of the number of shingles which he bunches. As he is paid by the thousand, an inspector also checks the tally.

Five grades of shingles are made, as follows:—

"Extra" A perfect shingle, clear and free from knots, shakes and stains.

"Clear" A perfect shingle at least 7 ins. from butt.

"2nd Clear" Sound for 5 ins. from butt and may have knots.

"Clear White" Clear of knots for 7 ins. from butt, but having sap.

"Extra No. 1" Sound for 5 ins. from butt with black knots.

The shingles are loaded on cars at the loading platform outside the mill. Those for which there is no immediate market are piled in the lumber yard. The New England States take the bulk of the shingle cut, although the Canadian market is rapidly increasing. The crew employed in the shingle mill consists of 2 sawyers, 2 bunchers, one overseer and 2 helpers. The sawyers receive about 16c per thousand shingles and the bunchers about 12c per thousand. Each machine has a capacity of about 15,000 shingles per day.

The Lath Mill

In the lath mill, only one kind of lath is manufactured and only one grade. This is known as the picket lath. The lath machine is situated about 100 feet ahead of the main band mill in a small ell of the main building. Edgings and slabs from the main band are carried by live rolls and chain carriers to the slasher where they are put into 4 ft. lengths and then pass along to the lath bolting machine. The bolter has a double saw which cuts the slabs into square bolts. These are fed into the lath machine which converts them into picket laths. The laths are then counted, bunched and tied up with tarred yarn, then the ends are trimmed by means of a circular cut-off saw.

Lath edgings are bundled at the same time at the lath and are piled outside of the mill to be sold later for fuel. There is a large demand for these edgings for fuel, but at present much of them are burned in the refuse burner for lack of piling space. The crew employed in the lath mill consists of 4 sawyers, 1 buncher, 2 men who tie the laths, 2 men at the cut-off saw and 2 assistants. Their wages vary from $1.75 to $2.10 per day. Many of the lath are piled in the yard to season, but most of them are shipped immediately by rail to the New England markets. The output is about 25,000 laths per day.

The Cooperage Industry of Canada

By James Innes, Chatham, Ont.

The cooperage industry is one of the oldest in Canada. Its origin was contemporaneous with that of the fur trade, and the shipment of hewn timber to Europe. "Canada butts" and "Quebec Pipes," are trade terms, and while a few of these staves are now made in Canada the old names are still used for shipment from the Southern States.

The late Mr. Eberts, one of the oldest settlers here, has told the writer that, 40 to 50 years ago, McGregor's Creek at Chatham, used to be full of staves every spring, these staves being run down from miles above Chatham, when the spring freshets were on. They were made and hauled to the creek during the winter months. My venerable friend, Mr. Neil Watson, Mayor of Mull, says that every winter, when he was a boy, one of his occupations was to drive loads of pipe staves from Mull to the Rond Eau to be loaded on schooners for Quebec. It is also asserted that schooner cargoes of staves for butts, pipes and hogsheads, were shipped direct to Europe from Chatham.

These were all tight barrel staves, and this industry is now almost a thing of the past, practically the whole of the staves, hoops and heading now manufactured in Canada being for the slack barrel trade; that is, for barrels not intended to hold liquids, but for flour, sugar, apples, salt, lime, cement, etc.

In former years, slack barrel staves and heading used to be made the same as rived tight barrel staves and heading are made now. First the logs were cut into bolt lengths, then a froe was used to split the bolt the proper thickness for staves or heading, the draw knife was then used to reduce to even thickness, the heading finished for rounding, while an inshave and outshave knife was used to put the circle on the staves. This work is now done on tight barrel staves with a steam bucker, but slack barrel staves are cut with a stave knife from the bolts after steaming, while the heading boards are sawn with a swing circular saw, kiln dried and planed on a steam planer, and turned on a steam heading turner.

While $1.00 per barrel was paid for making a flour barrel in the old way, they are now made by the coopers at from six to seven cents each; and if all the barrels used in Canada to-day, had to be made in the old way, more coopers would be required than for almost any industry outside of the Agriculture and Transportation.

Fifty years ago, oak was used almost exclusively for all kinds of barrels. Now, oak is used for tight barrels only, and in addition to oak, elm, basswood, ash and beech are used for barrels to hold liquids. For slack barrel stock, elm is now the favorite wood for staves, but millions of staves are made annually from birch, beech, maple, ash, spruce and basswood.

For heading, basswood, maple, birch, spruce, balsam and in fact most native woods are used. For flour barrels, basswood is the favorite, and is also preferred to any other wood for most purposes, but it is getting so scarce and the price has advanced so, that other woods are taking its place. Elm is used exclusively for patent coiled hoops, but millions of half-round hoops made from saplings are also used. Second growth hickory, maple, chestnut, birch and other woods are answering the purpose.

Production of cooperage stock in Canada has decreased as the forests have vanished. The manufacture of tight barrel stock from Canadian woods (oak, ash and elm), is almost a thing of the past, and while 25 years ago, there was a cooperage mill at nearly every railroad station in the counties of Kent, Essex and Lambton, ninety per cent of them are now defunct, or removed to points east and north, where timber is still available. While over 200,000,000 staves were exported from Canada in 1892, in 1913, nearly 8,000,000 staves were imported from the United States (slack barrel staves), while practically the whole of the tight barrel stock consumed was imported. Elm hoops were also imported to some extent, but only a few cars of heading.

Production of slack barrel stock this year will be about ten per cent over that of 1913, so that there will be enough stock made to take care of the home trade and leave a little for export.

Consumption of stock is increasing to some extent, but not in proportion to general business, as a great many substitutes for barrels are being uesd, sometimes to the detriment of the goods, as there is no doubt that the sack is a most unsanitary coveirng for food stuffs,

such as sugar, salt, flour, etc., and sometimes the contents arrive in an uncleanly state, after being exposed to contamination in filthy railroad cars, odors which are only too readily absorbed, and other unsanitary exposure.

It is estimated that thirty to forty millions of staves with hoops and heading to match will be required for apple barrels this year, the barrel being the only package so far discovered that can be uesd successfully and economically to carry apples for export.

There is still a large quantity of timber in Canada available for cooperage material. The industry is a staple one, and, if the reforestry projects so much discussed are put into practical effect, the same as in Norway and Sweden, its future will be assured.

Fire Protection and the Railways

Situation Today Indicates that Governments are Chiefly to Blame Instead of Railways

A discussion of the railway fire situation in Canada, by Mr. Clyde Leavitt, Forester of the Commission of Conservation, was one of the addresses delivered at the recent annual meeting of the Eastern Forestry Association, held at Gorham, N.H. It had been the fashion, in a certain extent, to lay the blame for the continuance of forest fires, upon the railways, Mr. Leavitt said. The blame however, should be laid he believed, upon the governmental authorities having jurisdiction. After outlining and discussing the activities of the Board of Railway Commissioners and The Commission of Conservation in the direction of preventing forest fires, Mr. Leavitt said that the whole aspect of the railway fire situation had changed radically within the past two years, or since the organization of the Fire Inspection Department of the Board. From being a major source of forest fires, the railways gave promise of dropping well down in the list of minor agencies. Not only this, but in many cases the railways were assisting materially in the control of outside fires originating even at a considerable distance from the track.

Mr. Leavitt explained the co-operative system in force between the Conservation Commission, the Board of Railway Commissioners and the Forestry Branches of the Dominion and Provincial Governments. This scheme, he said, had worked out admirably, and its efficiency was steadily increasing. The co-operative idea was also developing rapidly in other directions. There were now in Quebec two co-operative fire protection associations protecting an area of nearly fourteen million acres. In these cases there was not only co-operation between the lumbermen, who were the backbone of the associations, but the Provincial Government also was co-operating by directing the allotment of funds, and also by deputizing the managers, inspectors and rangers of the associations. To a really remarkable extent the various agencies concerned with forest fire protection were now closely knit together for the accomplishment of a common end. The process was still far from complete, but the progress already made rendered the situation decidedly encouraging.

The Disposal of Slash

Referring to the disposal of slash on lands adjacent to railway rights of way, Mr. Leavitt said that, all the railways could do in cleaning up their rights of way would never give adequate protection, as some sparks were sure to fall outside the right-of-way, causing fires which might spread rapidly on adjoining lands. Unfortunately, nowhere in Eastern Canada, was there provision for brush disposal, either on private lands or on Crown timber lands under license from the Provincial Government. The Commission of Conservation and the Canadian Forestry Association were both agitating this general question and, no doubt, in the course of time, some legislative provision would be made. The difficulty however, was very great, not only on account of the natural opposition of lumbering interests, but also on account of the tremendous inertia to be overcome, due to the lack of an actively favorable public sentiment.

In conclusion, Mr. Leavitt said, that in Eastern Canada, a very large percentage of the land was non-agricultural and of value only for timber production. Such lands were still, for the most part, owned by the provincial governments and the right to cut timber was granted by licenses which though renewable from year to year, were practically indefinite in tenure. In both Ontario and Quebec, limit-holders were required to pay the cost of fire protection, in addition to the annual rental fee of so much per square mile, and stumpage dues payable when the timber was cut. Naturally, the limit-holders were chiefly interested in the remaining merchantable timber, and to most of them the protection of young growth on cut-over and burned-over areas was of very minor importance. The result was, as a general rule, that the young growth received only the most perfunctory attention, if any. The provincial governments, especially in Ontario, were still not sufficiently alive to the necessity for protecting young growth, and, as a result, the areas from which the forest revenues must ultimately come, were often without any real fire protection at all. This was a direct and logical result of the license system, coupled with the placing of nearly the whole burden of fire protection upon the limit-holders.

The one encouraging sign at the present time was the apparently strong tendency toward the organization of lumbermen's co-operative associations. This resulted in the protection of young as well as old growth, the provincial government, in the case of Quebec, making an annual grant in consideration of the protection of the young growth.

A Progressive Young Montreal Firm

Among the younger wholesale lumber firms in Montreal which have recently extended their field of operations is the Canada Lumber Sales Company, Limited, with offices in the Dominion Express Biulding. The company specialize in New Brunswick spruce, southern yellow pine, and California redwood, and have recently secured some substantial contracts for railroad ties and timber. A general wholesale business is also transacted. The directors are Messrs. Oscar F. Berthiaume, Arthur P. Beaupre, and J. Henry Poulin. The two latter have been identified for several years with the lumber trade, and their experience should result in steady growth for their company.

Mr. Berthiaume, the president, has business connections with Montreal, but resides at St. Bruno, P.Q., of which place he has been Mayor for several years. He is an enthusiast for good roads, and the district of St. Bruno is particularly well served in this respect.

Mr. Beaupre, the managing director, has been connected with the wholesale and retail lumber trade for 17 years, and has also other business connections in the city.

The sales end of the company's trade is in the hands of Mr. Poulin.

Mr. J. C. Gadoury, secretary-treasurer, is of old French stock, and is the son of Dr. Gadoury, of Berthier, a man identified with the Conservative opposition at Quebec, representing Berthier county there. His energy will help in the advancement of the company.

Important Extensions at Bathurst, N.B.

Fine Up-to-Date Planing Mill Erected by Bathurst Lumber Company —Modern Equipment and Splendid Shipping Facilities

One of the most successful lumber manufacturing companies in the province of New Brunswick, a company whose products are now known, not only in the Maritime Provinces, but in many parts of Quebec and Ontario, is the Bathurst Lumber Company, Limited, Bathurst Village, N.B. Under the management of Mr. Angus McLean, the company's business has undergone remarkable expansion during the last few years. About two years ago a definite effort was made to interest the Ontario trade in New Brunswick lumber products and the effort was successful, even beyond the company's anticipations. It seemed rather questionable at first whether the stock could be disposed of in Ontario with the handicap of such a long rail haul. Energetic and business-like methods, however, proved that there was a good opening in Ontario, and a continually growing and profitable business has resulted.

The Bathurst Lumber Company are fortunate in having behind it men who are not content with an ordinary volume of business. They are continually stretching out for new markets and seeking opportunities for the production of new products which will enable them to do a larger and a more varied business. Following this policy, they have recently erected one of the most modern and efficient planing mills to be found in Canada. The planing mill, which is now running and turning out first class work, is located on the main line of the Intercolonial Railway, just outside the lumber yard, with a siding running into the plant. They are thus enabled to handle lumber from cars into the mill and from the mill into cars at the lowest possible cost. The planing mill building is 100 ft. long and 63 ft. wide, and is covered with steel. The equipment includes: 1 60-in. Mershon band resaw, 1 50-in. Mershon band ripsaw, 1 S. A. Woods Company fast matcher, 1 S. A. Woods Company fast double surfacer, 1 Hoyt matcher for hardwoods, and 1 Berlin moulder. Sufficient room has also been provided for two more fast matchers, to be installed later. The capacity of the plant is from 5 to 6 carloads of dressed stock per day.

The Electric Power Equipment

The whole mill is run electrically, each machine having a separate motor. The motors were furnished by the Canadian Crocker-Wheeler Company, Limited, St. Catharines, Ont. The generator for this power plant was made by Allis-Chalmers Company, of Milwaukee, Wis. The sawdust and shavings are blown to the main concrete boiler house eight hundred and eighty feet distant, where the power is developed. A modern blower system has been installed and is the latest improved thing in its line. The pipe line for the shavings and sawdust is said to be one of the longest in the world, used for this purpose. This new dressing plant puts the Bathurst Lumber Company in a position to give the best service possible and is along correct lines for economy as it is now a recognized fact that lumber should be dried properly at the mill where it is produced, and also finished to suit the job it is intended for, at the point of production, thereby saving all possible extra handling and freights.

The Bathurst Lumber Company are also operating the large Nepisiguit Lumber Company mill, which is now sawing lumber and shingles. This plant has been entirely remodelled and is now equipped with 10 Dunbar shingle mills, 1 Clark Bros. 8 ft. band mill and heavy carriage, 1 Mershon 66-in. band resaw, 1 Clark Bros. double edger, 1 Wm. Hamilton Mfg. Co. lath mill and boulter, 1 2-saw trimmer, slashers, carriers and everything in the line of labor-saving devices. In connection with this plant, they have recently constructed ten workmen's houses, which are the best of their kind in the land. The interiors of these houses are all furished with Neponsit oak grain and cream wall board.

The concrete double bank mill is running night and day and the company are piling up in their yards (which have a capacity of 50,000,000 ft.), the finest spruce and pine produced in the Maritime Provinces. All their lumber is well graded, each width piled separate, and all well air dried before being shipped.

These mills alone, give employment during the spring, summer and fall (about seven months), to seven hundred men, most of them residing in the town of Bathurst. This number does not include men in the woods cutting and hauling logs. For about four months during the winter the company employ from twelve hundred to fifteen hundred men in the woods, getting the logs for supplying the mills.

In addition to their lumber manufacturing operations the company are now at work constructing their Mitscherlich pulp and container board mill, and have about one hundred and fifty men working on this job. They expect to have it in operation in one year. The capacity of this plant will be eighty-five tons per day, and it will give employment to a large number of men throughout the year. The capacity will be 25 tons of sulphite and 60 tons of container board per day. The mill will be electrically driven. Two of the 576 Babcock and Wilcox boilers will be equipped with ovens for burning the sawmill refuse. The mill will be electrically lighted.

Particulars of the Equipment

The Canadian Crocker-Wheeler Company, Limited, St. Catharines, Ont., who furnished the electrical motors, installed in the planing mill, state that these motors are all for use on a circuit of 550 volts, 3 phase, 60 cycles. The motors are all of the new improved type furnished by this company, suitable for heavy service and their sizes are as follows:—

Slip ring type machines,—1 50 h.p., 900 r.p.m.; 1 40 h.p., 900 r.p.m.; 1 40 h.p., 600 r.p.m. Each of these machines is supplied with secondary starter and resistance for starting duty.

Squirrel cage type machines:—1 60 h.p., 900 r.p.m.; 1 25 h.p., 900 r.p.m.; 1 20 h.p., 720 r.p.m.; 1 20 h.p., 1200 r.p.m.; 1 7½ h.p,, 1200 r.p.m.

Each of these motors is supplied with a Crocker-Wheeler Company standard oil-immersed starter with no-voltage release attachment.

Detailed descriptions of these motors can be found in bulletin No. 155, issued by the Canadian Crocker-Wheeler Company, Limited.

The Canadian General Electric Company, Limited, Toronto, report that the electrical equipment for the Bathurst Lumber Company's planing mill, furnished by them, includes three transformers, each 75 kv.a., 60 cycle, single phase, 2300/600 volts, three transformers each 15 kw., 2300/110 volts, and a switchboard of blue Vermont marble suitable for a 250 kw. generator. The electrical plant also includes an Allis-Chalmers 200 kv.a., 2400 volt, 3 phase generator direct connected to an Allis-Chalmers steam engine, operated at 200 r.p.m.

Wm. B. Mershon & Company, Saginaw, Mich., who furnished part of the equipment for the planing mill, report that the machines supplied by them were their new Standard 60-in. band resaw, and their power feed band ripsaw No. 1 with extension front, both of which are illustrated and described in this company's catalogue. These machines are modern in every particular and represent the latest developments in band resaw design and construction.

The fast feed planer and matcher No. 404, 15 x 6 in., furnished by the S. A. Woods Machine Company, Boston, Mass., is equipped with the Woods Patented double profiling attachment and is capable of matching stock or dressing sidings, of any commercial pattern, up to 300 lineal feet per minute.

This machine is fitted with the Wood's patented automatic feeding table by means of which the feeder can maintain a cotninuous feed of lumber through the machine without any difficulty, at 200 feet per minute, or faster if necessary.

The fast feed double surfacer No. 450, 24 x 6 in., furnished by the S. A. Woods Machine Company, is capable of working up to 200 lineal feet per minute, and is used for surfacing one or two sides. It has the same capacity as the No. 404.

In addition to the planers the S. A. Woods Machine Company furnished a complete grinding outfit for sharpening all the cylinder knives, side head, profiler and other miscellaneous knives furnished with the outfit.

Moving the Forest Products Laboratory

Arrangements are being made for the removal of the Forest Products Laboratory, McGill University, from the old medical building to a building recently acquired on University street, where a miniature pulp and paper making plant will be installed for experimental purposes. Mr. O. F. Bryant, lately chief chemist of the Nekosa-Edwards Paper Company, Port Edwards, Wisconsin, has been appointed assistant chief of the pulp and paper division. Mr. Bryant is a graduate of New Hampshire University.

Mr. J. Bates, the head of the laboratory, recently returned from a visit to the principal pulp mills in the St. Maurice River, P.Q. district. It was intended that he should visit the pulp and paper making schools in Germany, Sweden and other European countries, but in view of the present situation this will no doubt be abandoned.

The Riordon Pulp and Paper Company report sales to June 30 amounting to $1,027,657 which represents an increase of $226,932 over the same period a year ago. Net profits of $132,455 represent an increase of $2,500.

Nova Scotia's Fire Protection Problem

Natural Forest Reproduction Capable of Maintaining Logging Industry If Fire is Kept Out—Recent Important Innovations

Specially Contributed by Elihu Woodworth

IT appears to be a difficult matter to make the average man realize the wonderful recuperative power and capability of our Canadian forests. Much has been said and written concerning the forest wealth of the Dominion, and all are more or less familiar with the magnitude of our lumbering operations, but there appears to be a somewhat general impression that the present activity is only hastening the end, and that the time is rapidly approaching when the great lumber industry will be little more than a memory. This impression is largely due to the destructive manner in which lumbering was once carried on in this country. Felling the trees at one time practically meant the destruction of the forest. The wasteful way in which the work was done left litle opportunity for speedy recovery. The forest growth was destroyed so completely that there was no possibility of reproduction. The recuperative power of the woodland was forced to take another direction, and resulted, if left to itself, in a totally different growth and usually in a much less valuable product.

The reason for the wasteful and destructive manner in which the forest was treated is not hard to discover. In the pioneer days the forest was regarded more or less as an enemy. It had to be removed to provide land for cultivation and for pasture. Its only value to the early settler was to supply his personal requirements in the way of building and fencing material and of fuel. There was no market for the product of the forest and magnificent timber was felled and burned as the quickest and easiest method of getting it out of the way. If the timber thus destroyed in cleaning some farms were available today, it would be worth much more than the farms in the present condition.

Even in later days, when timber began to have a regular market value, when "Jack-knife" saw mills were erected on many of the streams, and farmers began to adopt lumbering as a "side-line." The methods of operating were extremely wasteful and destructive. The farmers saw no occasion for economy in the forest, no matter how careful and saving they might be elsewhere. Why worry about saving timber when the woods were full of it?

Why let a young tree stand when it was easier to fell it than to go around it? Why chop a tree close to its roots, where it is largest, when it is much easier chopping two or three feet above the ground? Why trim the tops of trees and get knotty lumber when an abundance of logs might be had without doing any trimming? The philosophy of the farmer-lumberman failed to find any need of economy in his woodland operations, and it is not surprising that men who were familiar with his methods and with the methods of many of the lumbermen who succeeded him, thought they saw in the vastly increased output of the later years, the beginning of the inevitable end.

Production Still Increasing

But the end of the lumber industry is not yet in sight, at least so far as Nova Scotia is concerned, and there is no marked diminution of the yearly lumber output. It is true that the shipments from some localities are smaller than in former years, but, on the other hand, the exports from other sections have largely increased. It is also true that the quality of the lumber now shipped from some ports differs materially from that which was formerly exported. More small lumber is now shipped, and there is a marked increase in hardwood shipments. This is partly due to changes in the demand, and partly to a more intensive system of lumbering. Trees which were too small to make deals, and which, when they had to be felled, were left in the woods, are now converted into scantling or battens. Under present conditions a profitable market has been found for stuff that in former years was not considered worth handling.

As an illustration of the permanence of our lumber industry when an intelligent system of operation is adopted, the case of Parrsboro, N.S., may be cited. Parrsboro is the leading port in Cumberland County, and in 1890, owing to good markets and other favorable conditions the lumber shipments, which for years had been steadily increasing, reach their culmination. This was the day of the wooden sailing ships, and as many as twenty ships and barques might have been seen at one time in Parrsboro Roads taking in cargoes of deals for the British markets. There was abundant employment for every one who was able and willing to work, and it was a period of general activity, but the pessimist was abroad in the land and the cry that Parrsboro's lumber trade was done was heard on all sides. Some of the prophets of evil admitted that a few scattered cargoes might still be shipped from time to time, but all agreed in pronouncing it impossible that the further output should ever again reach the proportions it had then attained. But, notwithstanding all pessimistic predictions, lumbering operations still continued and the output showed no startling decrease. Fewer deals were shipped, but the quantity of small lumber cut was much larger than before, and helped to even up matters. Some timber limits changed hands, and the new owners went to work with a will. Other owners increased their holdings, and pushed their operations with renewed vigor. Saws were introduced in the place of axes for felling and cutting up trees, and this effected considerable saving of lumber and labor. Tree tops, such as were once left in the woods, were carefully trimmed, and thus more lumber was saved. A way was found to reach patches of timber which had been left standing because they were not easily accessible, and in this way some valuable lumber was added to the general output. In the meantime the recuperation forces of the forest were quietly getting in their work, and trees that were scarcely more than saplings when the land was chopped over were rapidly becoming large enough for sawlogs. Fluctuations in the extent of the shipments have been caused by low prices, high freight rates, scarcity of snow and other unfavorable conditions, but the general average has been fairly well maintained, and now, after the lapse of nearly a quarter of a century, this season's output promises to establish a new record and exceed the shipments of any other year. This surely furnishes satisfactory proof of the reproduction capability of our forests under judicious treatment, and affords a reasonable guarantee of permanence, if careful and intelligent conditions are observed.

Fire the Most Dreaded Enemy

Fire is the most dreaded and destructive enemy, with which the lumberman has to contend. Forest fires, however, would be practically a negligible quantity, if it were not for the criminal carelessness or thoughtless of irresponsible persons. Great conflagrations have been caused by the neglected fires of fishermen and other campers, and nearly all forest fires may be assumed to originate in this way. By far the greater number of those who visit the lakes and streams of the forest are, strictly speaking, trespassers, but few would object to their presence if it were not regarded as a menace to the safety of valuable property. If forest fires merely destroyed the standing timber on the lands they ravage, the result in all cases where the flames are not speedily checked would be a serious loss, but, unfortunately, in many cases, the effects of a conflagration are much more disastrous. When a tract of woodland is carefully and judiciously cut over, the operations may be repeated in fifteen or twenty years with satisfactory results, but, when the forests are devastated by fire, thirty or forty years must elapse before the land will regain any value for lumbering purposes. Even then the trees that were destroyed are likely to be replaced by an entirely different growth, and in many cases the new crop is practically valueless for lumber. It is fair to assume that the persons who are chiefly responsible for all this loss and destruction do not fully realize the amount of mischief caused by their carelessness, and there is always hope that they may be led to adopt a wiser and less dangerous course. But if there be any who wilfully and recklessly leave fires in the woods which are fairly certain to cause damage, they should undoubtedly be subject to severe punishment.

Various efforts have been made in recent years to provide for the protection of the forests of Nova Scotia. The Legislature has passed an act authorizing the appointment of forest rangers in all parts of the province. The chief ranger in each county has authority to summon any one within reach to assist in fighting fires, and to impose penalties in any cases where his commands are disregarded. The deputy rangers are supposed to be constantly on the watch for incipient fires, and to report at once to headquarters, if a fire be discovered, meanwhile making every effort in their power to arrest its progress. The owners of timber lands pay an annual tax of one-fourth of a cent per acre on all their holdings, and the fund thus raised is applied to defray the cost of the service. In this system, as in many other undertakings, very much depends upon the quality of the men selected to fill the positions. In some cases the working of the system has proved fairly satisfactory and large fires have undoubtedly been prevented by the prompt and energetic action of the rangers. In other cases the work has been poorly done and not at all to the satisfaction of the lumber operators. In fact, it has been stated, on what should be good authority, that forest fires in some districts have burned several days without being reported. If this be true, it is not sur-

prising that some lumbermen are seeking a more efficient and reliable protection.

Private Enterprise Becoming Active

One of the largest operators in Cumberland county has recently adopted protective methods such as have been in use some years on portions of the Pacific Coast, and in some other large lumber regions. He has erected steel towers on the highest elevations of his timber lands, and these are so arranged that they command a view of the whole area. These towers are connected with each other and with the outside world by telephone. In each tower, while daylight lasts is stationed a reliable man who is furnished with powerful field glasses. If one of the watchmen sees a puff of smoke in any part of the forest it is his duty to notify the others of the fact, giving them the direction in which the smoke is seen and if possible its approximate distance from the nearest tower. The watchman who happens to be nearest to the spot where the smoke is discovered is instructed to go at once to the threatened point and ascertain whether the fire which causes the smoke is likely to prove dangerous and whether outside aid will be required. Meanwhile the men remaining in the towers are under instructions to keep a sharp look-out for any person who may be going out of the woods, as it is hoped in this way to discover who is responsible for setting the fire. Of course, the whole staff of watchmen will help in putting out the fire if required, and if necessary, the mill men and others within reach may be called in by 'phone to assist. This should do much to lessen the danger from forest fires for it should prevent them from geting beyond control. With plenty of help within reach the suppression of a fire in its earlier stages should be easily accomplished. The system is said to work well wherever it has been tried, and the lumberman who is introducing it into Cumberland feels assured of its success. The cost of operating will be somewhat greater than under the present system, but it is confidently believed that the resutling benefit will be much more than correspondingly great. If the system proves as efficient as it is hoped and believed it will, there is no doubt that the Government will be asked to substitute it for the system now in use. Failing in that, it is probable that a lumbermen's protective association will be organized, so that ,by co-operation, they may be able to secure the best results. The forests of Nova Scotia are a valuable asset. They have produced much wealth, and they have given employment to an army of men, and very frequently at times when other employment was hard to get. Even their partial destruction would be a great calamity. Therefore the introduction of any measure which will protect them against this greatest enemy, against the only one that really threatens their permanence will be a consummation that will be gladly welcomed by all right thinking people.

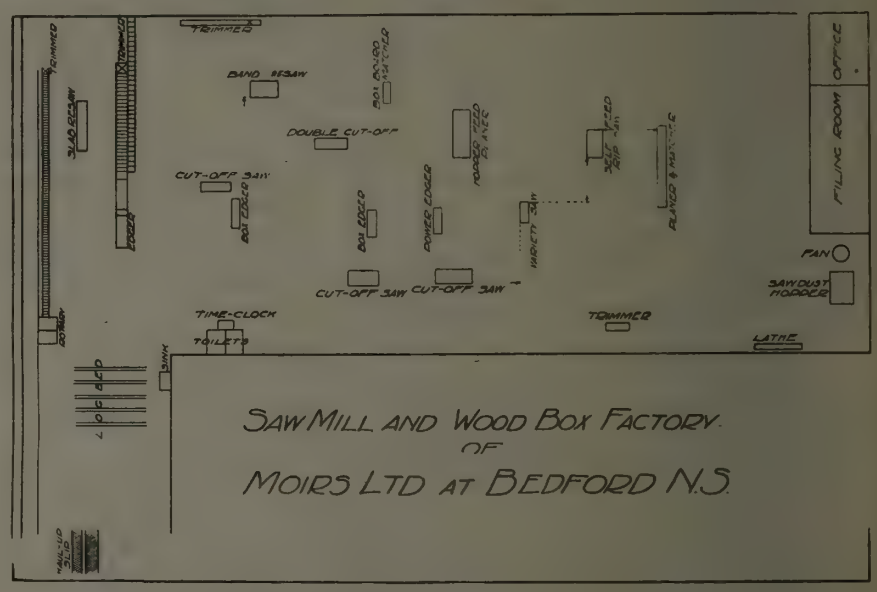
Confectionery Firm's Fine Sawmill

Concrete Building With Modern Equipment Belonging to Moirs, Ltd., of Halifax —Layout and Operation of Interesting Plant

MOIRS, Limited, of Halifax, Nova Scotia, the largest bakery and confectionery manufacturing establishment in Canada, have for a great many years operated a saw mill and wood box factory, their mill being situated at Bedford, about nine miles from Halifax.

About two years ago the mill, which was a wooden structure, was completely destroyed by fire. The firm immediately commenced to build a modern mill of reinforced concrete with mill construction floor and wood truss roof. The building is 110 ft. long, 60 ft. wide with a 10 ft. high basement and 11 ft. clear under the truss on working floor. A concrete floor has been laid in the basement. The first floor, which is of mill construction, is covered with hardwood. A new turbine house, shavings vault, engine room, boiler house, smoke stack and dry kiln have been built, all of reinforced concrete. The doors and windows are of fireproof contsruction. The roofs of all buildings, with the exception of the mill, which is covered with galvanized iron, are of reinforced concrete. The main line of shafting, which is 100 ft. long, and all countershafts are hung to the ceiling in the basement, all belts being brought up through the floor to connect with the different machines.

On the working floor of the mill there are no posts, belts or any other obstruction to interfere with the quick and economical handling of materials. This floor is on a level with the platform of a railway car, and all shooks and lumber can be loaded direct from the machines. The building is electrically lighted, all the wiring being done in conduit. On the mill floor alone there are eighty thirty-two candle-power incandescent lamps. The current is supplied from a generator, which is operated by a small 8-in. turbine built especially for this purpose by Messrs. Charles Barber and Sons, of Meaford, Ont. The mill is operated by a 150 h.p. Canadian turbine, also furnished by Messrs. Charles Barber & Sons. A steam plant of equal



capacity has been installed as an auxiliary, and has been placed in such a way, that simply by pulling the lever on a friction clutch, the drive can be changed from water to steam. The machinery for the saw mill was supplied by the Lane Manufacturing Company, of Montpelier, Vermont. All the heavy machinery such as, band resaws, planer and matcher, self-feed rip saws, hopper planer, etc., were supplied by the Berlin Machine Works, of Hamilton, Ont. The small box machines were purchased from Messrs. B. G. Luther Company, Inc., of Worcester, Mass. The blower system to take care of the shavings

Reinforced Concrete Sawmill at Bedford, N. S., belonging to Moirs, Ltd., Halifax, the well known confectionery makers.

and sawdust was installed by the Sterling Blower Company, of Hartford, Connecticut. The transmission machinery by the Dodge Manufacturing Company, of Toronto, and the leather belting by Messrs. J. L. Goodhue & Company, Limited, of Danville, Quebec.

Moirs, Limited, carry on their own logging operations, and each year cut about one and one-half million feet. These logs are conveyed by water about fifteen miles to the mill. Most of the lumber is used in the manufacture of boxes and cases for the packing of Moirs' biscuits and Moirs' confectionery, which are so well known to the people of Canada. They also manufacture flooring and sheathing and ship hardwood deals to the English market. Last year they supplied some of the large timber, which was shipped from Halifax for use in construction work at the Hudson Bay Terminals. The logs are sawn on a double rotory mill supplied by the Lane Manufacturing Company, two thirty-two-inch inserted tooth saws being used, one above the other. The mill has a capacity of thirty thousand feet per day.

The firm own a large tract of timber lands, and control a valuable water power having a 60 ft. head. The water is conveyed from the lake to the turbine by an iron pipe 4 ft. in diameter, and about half a mile long.

Interesting New Mill At Joliette, P. Q.

William Copping After Losing Two Mills by Fire Constructs Splendid Plant With Capacity of Ten Million Feet a Year

At Joliette, P.Q., the new mill erected recently by Wm. Copping, to replace the one which he lost last summer by fire, has now been in operation since July 2nd, and is proving to be a splendidly designed and equipped plant. With the experience of many years in the lumber business, and with the added experience resulting from having been twice a victim of fire loss, Mr. Copping has been able to erect a plant which is the equal in efficiency of any plant of similar capacity in the country.

The building is 48 ft. x 172 ft. of two and one half storeys, standing on a solid stone foundation built partly over the river bed. The river bed is a solid ledge of rock, affording an ideal foundation upon which to erect a building.

Alongside of the mill, on the side adjoining the river, are boiler and engine rooms, in a building which is 31 ft. wide by 99 ft. in length, built with a solid wall of brick one-foot thick and covered with 2 x 6 timber on edge side by side, making a roof 6 inches thick which is supposed to be practically fireproof, and is known as a "slow-burning" roof.

The machinery in the mill consists of two eight-foot single cutting band mills, taking 12-in. saws with 10-in. x 36-ft. steam feeds; one Kendall circular gang; one Diamond Iron Works resaw with six foot wheels taking ten-inch saws; two 40-in. edgers, slashers, trimmers, log haul, steam loaders, niggers, kickers, and all the necessary shafting, friction pulleys, etc.

Wm. Copping's Mill, Joliette, P. Q.

In connection with this mill Mr. Copping has also another small sawmill 20 ft. x 65 ft. of two storeys, in which he has installed a fifty-two inch inserted-tooth circular saw, with small cut-off saw and hand edger. This small mill is run by water, but when the water becomes too low, it is hitched up and run by steam along with the large mill.

The power for the main sawmill is supplied from a battery of four 66 in. x 16 ft. horizontal return tubular boilers, and the mill is run by a 19-in. x 24-in. Atlas heavy duty engine, with the exception of the circular gang, which is run by a 150 h.p. Leonard engine, independent of the rest of the mill.

The filing room machinery consists of two Hanchett automatic band saw sharpeners, one automatic rip and cross-cut sharpener, retoother, lath grinder, brazing table, forge, etc., all Hanchett machinery. One 8 h.p. vertical engine supplies the power for the filing room.

The machinery has been supplied, partly by The Wm. Hamilton Company, Limited, of Peterboro, Ont., and partly by The Waterous Engine Works Company, Limited, of Brantford, Ont.

The saws are partly from Henry Disston & Sons, Limited, and partly from The Simonds Canada Saw Company, Limited, and the belting from J. L. Goodhue and Company, Limited, of Danville, Que.

Throughout the mill is installed a complete water system for fire protection of perforated pipes in which are placed a cluster of three brass nipples spaced every three feet apart. This system is connected on to the corporation main, and there is also a belt-driven pump in connection with the mill, of 2,000 gallons capacity per minute, which is operated by one of the water wheels, and connected with all the different feed pipes.

This year Mr. Copping has a cut of about 9,000,000 feet of logs, but, as part of his drive was hung up, he may not saw more than four or five million feet this season, unless heavy rain should bring down the balance of the drive.

In planning the mill Mr. Copping estimated upon cutting about 10,000,000 feet of logs per year. At present he is turning out from 80,000 to 100,000 feet of lumber per day, and feels satisfied that the mill will turn out 10,000,000 per year if required.

It is now about fifty years since Mr. Copping settled in Joliette,

Wm. Copping
General Manager

D. E. Copping
Manager

S. E. Copping
Former Woods Manager

Thomas Wilson
Mill Foreman

P.Q., and since locating there he has been interested in several different kinds of business, principally the lumber business. He conducted a general grocery and provision store for several years and also worked for a number of years with Mr. A. Kelly in the grocery business. Then he became interested in the lumber business with Mr. F. Kelly as partner. Later on Mr. Kelly died and his son became Mr. Copping's partner. After this he sold out his share to the son and then opened a store on his own account. Not long after this Mr. Kelly Junior failed and the Hochelaga Bank became the owners of the mill property and limits, and it was from the bank, in 1892, that Mr. Copping bought the property and became sole owner.

Then he pulled down the mill which was a steam-driven plant and built a new sawmill which ran by water power. In this mill he had two circular saws and a re-saw, edger, etc., with which he used to cut about 40,000 logs per year. The output was gradually increased until he eventually had to install steam power, as the water power was decreasing every year. This he did about the year 1902, and in 1907 he made a few changes and put in a double cutting band-mill with steam feed which he ran for three years until on the 21st of June, 1910, the mill was destroyed by fire.

Mr. Copping commenced immediately to rebuild and had the mill running by October, and got out part of his cut that fall. This mill was run with circular saws until the winter of 1912, when he made considerable changes, installing a single cutting band-mill with steam feed and a circular saw with steam feed, also a Kendall circular gang and a Diamond Iron Works re-saw, new edger, etc. The installation of this machinery was almost completed and the mill ready for operation when, on the 17th of June, 1913, the mill was again burnt to the ground, leaving Mr. Copping just where he had been in 1910; owner of limits and other property, with 140,000 logs in the river and no mill.

Mr. Copping lost no time in getting into touch once more with manufacturers of sawmill machinery, and ordering new machinery. While the plans of the present mill were being made out and the machinery built, he put up a small sawmill on the river bank in which he placed a circular saw rig which he had taken out of his sawmill the previous winter. This mill he ran by a 30 h.p. electric motor, and had it in operation by the 2nd of July, sawing out nearly all the dimension and other timber which he used in building the new mill, also sawing quite a lot of lumber for sale.

The plans for the building and for the layout of the machinery were made by Mr. I. N. Kendall, of Westboro, Ont., and the erection of the building and the installation of the machinery were under the supervision of James Morrison, of Ottawa, Ont. Mr. Copping commenced sawing in this mill on the 20th of May.

The limits owned by Mr. Copping consist of 63 square miles of timber land on which there is over 100,000,000 feet of standing timber, principally spruce, with a fair percentage of white and red pine. The driving facilities are very favorable, and it is very seldom that any of his drives are hung up, unless, as happened last spring, very dry weather prevails.

Mr. Copping's business is under the management of his nephew, D. E. Copping, who has been in his employ for 17 years, and the operation of the mill is under the supervision of Thomas Wilson, of Hull, P.Q., the foreman.

The lumbering operations and river driving were under the direction of his brother, Mr. S. E. Copping, until recent years, when his health interfered. Since then, Mr. Paul Charette, has been looking after this part of the work.

In connection with the sawmill Mr. Copping also operates a planing mill 52 ft. x 65 ft., one and one-half storeys, in which, at present, he has only old planers. He will soon be replacing these machines with new and larger planers. The planing mill is under the supervision of his old foreman, F. X. Flamand, who has been with him many years. The location of the plant is very advantageous as it caters to an extensive local trade, and having both C. P. R. and C. N. R. lines running through the town, he is able to sell the better part of his refuse at a profit.

Although trade conditions have not looked very bright so far this year, Mr. Copping reports that they are apparently commencing to pick up now.

Interesting Addition to Quebec Mills

Operations of Finch, Pruyn and Company Inc., in Lotbiniere County, P. Q—Modern Logging and Sawing Equipment Installed

ONE of the most interesting recent additions to the lumber producing plants of Canada is the sawmill which has been erected in Lotbiniere County, P.Q., upon that portion of the Seignoiry de Lotbiniere lying along the line of the Intercolonial Railway, about 130 miles east of Montreal, by Finch Pruyn & Company, Inc., of Glens Falls, N.Y. The area upon which the operations are conducted is nearly rectangular in shape, being 12 miles long and 5½ miles wide at the western end, but narrowing to just five miles on the eastern quarter. This gives an area of approximately 40,000 acres, about two-thirds of which is located south of the Intercolonial Railway. The company thus have about 14,000 acres north of the railroad and 26,000 acres south. The merchantable stand of timber upon this property is estimated about as follows:—

1. Red spruce—distributed over almost the entire area excepting a few swamps.
2. Balsam—found everywhere in mixture with the spruce.
3. Hemlock—heavy cut along the streams and scattered through much of the spruce and balsam.
4. Cedar—scattered through the spruce and balsam and in nearly pure stands in a few swamps.
5. Hardwood—yellow birch, ash, basswood, maple, etc., found on the high spots and along streams.
6. Black spruce and tamarack—nearly pure stands in the lowest swamps.
7. Pine—a few scattered throughout the tract.

The topography of the property is generally smooth and level with a very slight slope to the north, but not sufficient to make a serious grade. There are three streams of drivable size flowing from south to north through the property.

The Logging Operations

The operations of the company are conducted under a cutting right which expires at the end of twenty-five years from April 1, 1911. In view of this, the compartment system of cutting has been adopted and the area divided into twenty-four compartments, one of which it is calculated to cut each year, or in any event to so cut that the average will be 1/24th of the area annually. The interest of the company

Finch, Pruyn and Co.'s new sawmill on the Henri River, Quebec

Timber Crib Dam on Henri River, making Log Pond for Finch, Pruyn & Co.

in this investment and in the conduct of its operations for logging was primarily in securing a supply of pulpwood for its paper mills located at Glens Falls, New York, and the proportion of the spruce and balsam 11-in. and under which, cutting at the above rate would yield, supplies the company with its stock of Canadian pulpwood. The spruce and balsam logs 11-in. and up are, with the other stumpage, made into saw logs and manufactured into lumber at the company's mill located near the geographical centre of the tract on the Henri River. Operations for the seasons of 1911-12 and 1912-13 produced upwards of 25,000 cords of peeled four-foot spruce and balsam pulpwood and upwards of twenty million feet of saw timber.

The topography of the area and the proximity of the Intercolonial and the Grand Trunk Railways influenced the company to use logging railways for the transportation of their products. They have constructed, and have in operation at the present time, upwards of 12 miles of logging branches, including a branch from Joly Siding to the Henri River mill, a distance of nearly 5 miles. It is the intention of the company to use the streams for driving and floating logs to their sawmill, where such use proves to be an economy in comparison with the use of the railroad branches, but it is not probable that it will be found economical to put any of the pulpwood stock into the water. During the two past logging seasons there have been employed in these operations upwards of 600 men during the bark peeling season, and the average number of employees has been in the neighborhood of 400. Up to the present time the company have found it best to conduct this operation by contract, and all the logging heretofore done has been under a contract with one jobber sufficiently experienced and able financially to undertake the performance of so extensive a contract.

The railroad logging operations of Finch, Pruyn & Company are mostly by standard gauge railway, 56 lb. rails being used. The present equipment consists of two 42-ton Heisler geared locomotives and one 40-ton rod engine. The Heisler engines are equipped for burning oil during the dry months. This type of locomotive has proved very satisfactory for the existing conditions and is especially easy on the track.

Logs are loaded by means of an American Model C loader. This machine is fitted with standard gauge wheels as well as the regular wheels, so that it can be operated on standard gauge track. The loader is also equipped for burning oil. The log pond at the mill is formed by a timber crib dam across the Henri River at a point about a mile and a half north of the Intercolonial Railway. The dam is 19 ft. high and approximately 130 ft. long, with wings to the bank at either end. There is a 6 x 10 sluice-way through it. The pond extends up-stream some distance, submerging about thirty acres.

The Samwill and Equipment

The fine new sawmill of the company is located on the east bank of the Henri River and is connected with the present logging operations by rail. The yards were laid out with the idea of adding later a planing mill, a rossing plant for pulpwood, a tie and shingle mill, a chemical plant, dry kilns, or other developments, should conditions warrant investment in such enterprises. The mill was designed by Mr. L. H. Street, of Clark Brothers Company, Olean, N.Y., who also furnished the machinery. The mill building proper is 174 ft. by 40 ft. and the sorting table is 150 ft. long. There is also a large addition to be used later in the manufacture of specialties to meet the demands of the market. The mill is of heavy timber construction with corrugated iron roof.

The equipment of the mill is of very liberal design and was selected after much painstaking study of the requirements of the situation. The mill is served with logs by the usual single chain log slip. A large swing saw is located over the chain just inside the mill and used to cut in two double length logs. The mill has the usual steam operated log deck machinery, the kicker and loader having three and four arms respectively in order to handle satisfactorily logs of varying lengths. The logs are turned on the carriage by an 8 x 10 oscillating steam nigger.

The carriage has three blocks, with a fourth mounted on a trailer truck. It is fitted with hand set works and runs on 60 lb. railroad rails. It is handled by gun-shot steam feed, 12 inches in diameter. The band mill is a standard right-hand single cut mill with 8 ft. wheels for 12 inch saws. Cants from the band mill are transferred to the second sawing unit which is a Clark 7 ft. vertical resaw which carries a 12-in. saw. A single 75-inch edger stands between the two trains of live rolls and the slabs and edgings are taken care of by a slasher carrying five saws, which is located outside the main building in the by-product mill. This arrangement gives plenty of room for placing slabs on the slasher chains properly, so that there will be the least possible waste of useable stock. The design provides for the easy removal of the slasher saws, permitting the slabs to pass into the by-product mill to be cut into unuual lengths for specialties.

Lumber is trimmed on a Clark automatic trimmer which appears to be an innovation in Quebec but is widely used in the spruce mills in the United States. The sorting chains are of the usual type, and light trucks running on 25 lb. rails are used to take lumber out to the yards.

The carriage will handle logs up to 32 feet long. The balance of the mill is laid out to take boards or cants up to 24 ft. in length. The main line of live rolls can transfer boards to the trimmer, or dimension timber to storage chains as operation demands.

The by-product mill at present contains only lath machinery. This will be supplemented later by other by-product apparatus as noted above.

Transmission Machinery Equipment

The arrangement of the transmission machinery is notably simple and direct. There are two line shafts, one for the sawmill proper and one for the by-product mill. There is also a short shaft directly under the band mill, and these three shafts are driven by a divided American rope drive direct from the engine wheel. Rope drives have been used by Finch, Pruyn & Company with success in their sawmills at Glens Falls, and also in their pulp and paper mills at the same place, and this consideration influenced them to adopt a similar drive for the Canadian mill.

The refuse burner was located in the pond some 400 feet from the mill building and in such a direction that the prevailing winds blow away from the buildings.

The boiler house is of fireproof construction and contains, at present, three 72-in. x 18-ft. horizontal return tubular boilers mounted in brick casing. The boilers have individual stacks and the usual Dutch oven furnaces. They are suspended from wall girders supported by steel columns, so that no weight rests on the brick-work. They were furnished by the Waterous Engine Works Company of Brantford, Ontario. Provision was made for additional boilers should more steam be required on account of later additions to the plant. All the boiler steam outlets are provided with automatic emergency stop and check valves, and all of the steam piping is extra heavy. The blow-off valves are double and every precaution was taken to make the plant safe and reliable.

The Power Plant

The mill is driven by a Clark automatic two-value engine with cylinder 24 x 24. The engine carries a 10 ft. wheel grooved for fifteen 1½-in. ropes and runs 160 revolutions per minute. The engine room also contains two duplex outside, end packed boiler feed pumps and a cold water pump for supplying water to the feed water heater and for meeting other demands for water about the mill. The feed water is heated and purified by a Blake-Knowles 600 h.p. open heater. All of the principal steam exhausts go into a single exhaust main which opens into this heater and from which a connection is provided as a means of keeping open a part of the log pond for winter sawing.

The engine room further contains a 35 kw. Westinghouse lighting generator direct connected to an Ames automatic horizontal engine. This set furnishes power for lighting the mills, machine shop, warehouse, office, hotel, and bunk-house, as well as the yards.

The company has built adjacent to the mill a machine and blacksmith shop with ample room and equipment for ordinary repairs to mill machinery and to the company's locomotives and logging machinery. The isolation of the plant made it necessary to have an unusually complete shop equipment.

The matter of fire protection has received a great deal of attention. The system will include larger pumps and mains than are usually installed under similar circumstances. The company have also constructed a portable fire fighting car carrying a 6,500 gallon tank and a pump capable of giving three good fire streams. This pump is operated by steam from the locomotive which hauls the car. The car is provided with racks for hose and carries a complete equipment of tools so that it will be always ready for emergency calls during the dry season.

Ontario Timber Sales

The privilege of cutting red and white pine on three timber berths in the Township of Blyth, north-west of North Bay, Ont., has been disposed of by the Department of Lands, Forests and Mines by public tender. The highest bid was accepted for each berth and the province will receive a substantial payment on the lumber cut.

For berth No. 1, comprising 12 square miles of territory, J. R. Booth, of Ottawa, was the successful tenderer. He will pay a bonus of $10.50 a thousand feet board measure in addition to the Crown dues of $2 a thousand feet and $10 a square mile in ground rent.

For berth No. 2, in area 12 square miles, there were two equal tenderers, Mr. J. R. Booth and Mr. George Gordon. They agreed to operate on the limit jointly. A bonus of $8 a thousand feet will be paid in addition to the regular dues and ground rent.

Berth No. 3, which is six square miles in extent, went to J. B. Smith and Sons, of Toronto. That firm will pay a bonus of $10.26 a thousand feet on the cut, as well as the Crown dues and ground rent.

In each case a deposit was received by the Government.

Administration of B. C.'s Timber Lands

An Outline of Forest Protection, Logging Regulations, Scaling Methods and Timberland Examination as Carried Out by the Government

By H. R. MacMillan, Chief Forester for B.C.

The Forest Branch of the Lands Department in British Columbia is organized upon the theory that all that pertains to the administration or protection of timberlands is forestry. The general Canadian idea is that the planting of young trees is the chief end of forestry. In a country where there are no trees as in the western plains or in South Africa, or portions of Australia and New Zealand, this is true. But in a country like Canada where we have large areas of public forest land, carrying mature timber which is sought after by private individuals and in which logging operations are conducted, as well as large areas of devastated forest land covered with young trees, the hope of the future, every government owning tinber should rise above this narrow definition of forestry and seek economy in civil service organization as well as economy and efficiency in administration by entrusting to one unit or branch of the public service all lines of work connected with timber administration, whether it be tree planting, protection of the forest from fire and theft, exploration of the forest resources, inspection of logging operations, scaling, collection of revenue, framing a progressive timber sale policy and making of timber sales, studying forest industries and forest products or classification of timberland as differentiated fron land suitable for settlement. There should be no reservation of the Forest Branch to Forest Reserves. A forest organization capable of administering forest reserves, which are the hope of the future, is certainly capable of administering the other public timberlands which are the mainstay of the present.

The Forest Act of 1912 recognized these principles in British Columbia. The Forest Branch was organized to represent every duty of the government toward timberland, timber and the timber industry. The details of the organization are yet being worked out. The programme for 1914, while admittedly imperfect, is in advance of 1913, as 1913 was in advance of 1912.

The main divisions of the work being carried on at present are, fire protection, timber administration, land classification.

In the summer season the most conspicuous duty of a Forest Branch is the protection of the forest from fires. The British Columbia fire season is usually from April 30th to September 30th.

Forest Fire Protection

The method of financing the fire protective canpaign in British Columbia is fairly well known. The owners of all timbered Crown grants, leases, licenses or timber sales pay 1½ cents per acre per year. An equal sum is added by the government and the whole, amounting to $369,000 for 1914, is used for protection. The overhead expenses of administration and many permanent salaries are paid by the government.

The fire protective organization is not confined to privately owned tinber, or even to mature timber. British Columbia in common with Ontario, Quebec and other provinces, does, and always will, count timber amongst the first assets, and therefore the young timber is protected almost equally with the mature. A forest fire which escapes control anywhere is counted a disgrace.

The organization is made as simple as possible. An important section of the Forest Branch in charge of an Assistant Forester at Victoria is devoted to fire protection. This executive officer plans the organization, studies the fire situation so far as possible a year in advance and has staff, public regulations, staff instructions and equipment mapped out at least four months in advance.

The execution of the programme is carried out through a field organization of District Foresters, rangers and forest guards. The province, for forest administrative purposes, is divided into eleven forest districts, each in charge of a permanent District Forester who is responsible for all government forest work in his district. The forest districts vary in area from 6,000,000 acres to 36,000,000 acres. All forest land in each district, whether publicly owned, leased, licensed, or Crown granted, is under the administration of the District Forester so far as the government interest is affected. Each forest district is divided into ranger districts averaging in area 4,545,454 acres. The ranger is a permanent man, competent to handle all forest work, including fire protection. For the six summer nonths the forest ranger's chief duty is the supervision of fire protection. His efficiency in this work is increased by his knowledge of the district gained in other phases of forest work throughout the year.

The distribution of the forest guards, the temporary summer fire preventers and fire fighters, is decided by the district foresters and rangers. The number of guards and their locations are changed from year to year according to local fire hazards. The fire hazard has been found to begin about May 1st, run about constant through May and June and increase through July and August. Therefore, in order to get the most service for the money available, a skeleton force of men is put on about May 1st, to serve for five months. The District Forester is, at this tine, given authority to increase his force promptly at such times and at such places as weather conditions and fire hazards may indicate, but to endeavor to hold off until about July 1st, and at that time put on as many three months' men as are necessary. This plan has been found very satisfactroy. By giving the protection when it is needed and where it is needed it has increased the efficiency of the force without increasing the cost. The forest guards are all local men and are recruited from logging camp employees, surveyors' assistants, timber settlers, and other active men experienced in the woods and in handling men. They are paid $90 to $100 per month, allowed $12.50 per month for horse hire and are allowed board and horse feed when away from headquarters. Hiring them on the above terms by the month has been found more economical than the old system of hiring them by the day with full expenses. Many guards in British Columbia are supplied with boats.

The plan of fire prevention is the same as elsewhere. New and attractive notices are got out each year to catch the public eye. A constant attempt is made to reach all sections of the population and secure their support. This season mile boards bearing sentences of caution and interest about the forest were put up along all roads. Good pocket whetstones with a camp fire warning printed on the back were very popular with loggers, campers and boy scouts. Striking lithographs pointing out the necessity for care to prevent fire in the forest were put up in all roadhouses, schools, hotels and country banks. Attractive lithographs were distributed to the school children of the Province and the teachers were asked to give a lesson on fire protection. Colored lantern slides illustrating forest protection were distributed to all moving picture shows and are used as intermission scenes between acts. The rural preachers were asked to cooperate by delivering an appropriate sermon, as fire protection is a requisite of good citizenship. Altogether, an excellent spirit of cooperation has been secured which accounts more than anything else for any success we may have. In many sections of the Province not even an acre of little trees can burn without a fire alarm being rung in. The rural telephone companies carry a warning on the directory cover and every subscriber is a fire warden.

Distributing the Cost

The cost of fighting a fire is borne in different ways according to circumstances. If a fire originates within 200 feet of a railway the cost is borne by the railway company. If the fire starts on the workings of a logging operator the cost, if the operator has obeyed all provisions of the Act, is shared between the operator and the Government, otherwise the operator pays all. If the fire originates through carelessness on private land, the careless one bears the whole cost whenever he can be held responsible. Accidental fires on public lands are usually paid for by the Government.

The most valuable feature of the whole fire act is the permit system. Anyone lighting a fire for any purpose except cookery or securing warmth must secure a permit. Nearly 13,000 permits were issued in 1913 and only seven fires escaped. All guards and forest officers issue permits. The area to be burned is always inspected and precautions taken. If conditions are dangerous permits are refused.

The funds now available are insufficient to protect the timberlands of the Province adequately. An increase will be necessary as settlement increases.

Co-operation is received from the Dominion Government. Rural mail delivery carriers give notice of fire. The Meteorological Service gives warning of dry weather and fire winds, knowledge which is valuable in perparing for dangerous weeks by closing down permit and industrial fires.

All branches of timber administration, including inspection of logging operations, log scaling, log, grading, supervision of timber export, cruising and sale of Government timber and land classification are looked after by a section of the Forest Branch known as the Office of Management. This section of the Forest Branch is in charge of an Assistant Forester.

Inspection of Logging Operations

All logging operations are inspected on an average of once in three months. The inspection is carried on by the forest ranger in

charge of the district who reports fully to the District Forester after each inspection. The purpose of a detailed regular inspection is to keep the officers of the Forest Branch colsely in touch with the loggers and logging conditions of the Province, to enable the users of the timberlands to transact business readily with the Government. Whatever form forestry may take in Canada, whatever regulations may in future be considered necessary, the most important part of the work will be carried on through the logging camps. Therefore, before any policy of forest management can be launched, which looks towards cleaner logging, encouragement and protection of valuable young growth, there must be a close working co-operation between the loggers and the forets officers. The benefit of this working understanding will be expressed quite as definitely in the education of the forest officers as in the education of the loggers.

Logging inspection in British Columbia at present, in addition to keeping the forest officers informed of conditions, has for its object the enforcement of such regulations as prevention of trespass, marking the logs before floating and non-employment of Chinese and Japanese. Except in Forest Branch timber sales there is not at present any enforcement of regulations for clean logging or brush disposal. The Forest Branch has authority to charge double royalty on merchantable timber left in the woods, and to order the burning of dangerous slash, but under present conditions this authority is not generally exercised. When slash constitutes a serious hazard, orders are issued for its burning. An endeavor is made to secure the voluntary burning of slash by operators; about 6,500 acres was burned in Vancouver Forest District in May.

Rangers on logging inspection are instructed to see that all Government timber tributary to the operation is taken off before the operator leaves the ground. Such timber is sold by public tender. These sales vary in size from a few trees sold without formality by the District Forester, to sales amounting to 50,000,000 feet. Every timber sale contract requires clean logging, short tops, low stumps and brush disposal. The customary method of brush disposal on the Coast is broadcast burning, a cheap and effective method which disposes of the fire hazard and encourages the reproduction of Douglas Fir.

The demand for timber sales in 1914 is not so great as it was in 1913, the price of logs being down to an unprofitable level. The only exception to this is the demand for timber for pulp manufacture, several large applications being in hand to establish a thirty years' supply of timber for the B. C. Sulphite & Fibre Company.

Log Scaling Regulations

All log scaling in British Columbia is under the direct charge and supervision of the Forest Branch. West of the Cascade Mountains, logs are scaled by official scalers in the employ of the Forest Branch. The scalers are all experienced men. Additions to the staff are selected by written and practical examination. The scalers in each district work under the direction of the District Forester. In the Vancouver District, where the bulk of the scaling is done, the District Forester is assisted in his supervision of scaling by a supervisor of scalers who gives his whole attention to the scaling work.

As well as being a basis for Government royalty the scale is the basis for payment of all charges due on the logs, the payment of the logger, the towage, the purchase and sale of logs, etc. The scale is therefore of the utmost importance to everyone in the timber business. In order that all facilities might be provided for the hearing and consideration of any grievances, arrangements were made this year by the Forest Branch to meet quarterly a scaling committee of the lumber association and of the shingle association. The committees have been appointed and preliminary meetings held, possible methods of improvement of scaling being discussed. As a result of these meetings arrangements are now being made to give the vendor and purchaser of logs a copy of a detailed scale bill showing the number of logs of each diameter length and species. It was originally intended to number each log and to show in the scale bill the scaled contents for each log, but this plan was given up because of the impossibility of rolling the logs in the tight booms.

Mill tests will be conducted whenever opportunity offers throughout the year, the logs being scaled, then put through the mill and the scale tested out by a tally of the lumber or shingles produced. Several such tests have already been carried on in the shingle mills. These tests are valuable in enabling the scalers to keep informed as to the lumber or shingle contents of different classes of logs.

East of the Cascades a different system of handling logs necessitates a different system of scaling. On the Coast where annually over a billion feet of logs are gathered in the harbors of Vancouver, Victoria, the Fraser River and two or three other points, a small staff of scalers can do the work. In the Interior there is no such concentration of logs. There are very few instances where any two of the 140 mills operating are located close enough together to enable one scaler to do the work for more than one mill. Very few of the mills in the Interior operate the year around; consequently there is no employment of scaelrs the year around unless they take up work of a different nature, except in a few cases where a scaler can secure a position bush scaling in the winter and scaling in a mill in the summer. For this reason, and because of the large number of scalers required to supply the 140 mills and the short scaling season, it is inadvisable for the Government to engage sufficient men to do the scaling. Control of the scaling is maintained by awarding scalers' licences to scalers who have had the necessary experience, who are endorsed by lumber companies and who pass a written and practical examination conducted by the Forest Branch. Each operator in timber is required to employ a licensed scaler who reports the quantity cut direct to the District Forester. A further check is provided by the employment of a check scaler in each Forest District, whose duty it is to visit all mills in operation where licensed scalers are working, scale with them, instruct them in their duties and scale one or two days after them to determine how they are working.

The Doyle rule has been the only rule used in the southeastern portion of the Province. After December 31st this year the B. C. rule will be used throughout the Province.

Grading the Logs

No attempt is made to grade logs east of the Cascades, west of the Cascades a large proportion of the logs are graded by the scalers according to the following log grade rules established by the Forest Branch this year:—

Cedar:—

No. 1. Logs 16 feet and over in length, 20 inches and over in diameter, that will cut 50 per cent or over of their scaled contents in clear inch lumber; provided that in cases of split timber the foregoing diameter shall not apply as the minimum diameter for this grade.

No. 2. Shingle grade—Logs not less than 16 inches in diameter and not less than 16 feet in length that are better than No. 3 grade, but do not grade No. 1.

No. 3. Rough logs or tops suitable only for shiplap or dimension.

Culls. Logs lower in grade than No. 3 shall be classed as culls.

Fir:—

No. 1. Logs suitable for flooring, reasonably straight, not less than 20 feet long, not less than 30 inches in diameter, clear, free from such defects as would impair the value for clear lumber.

No. 2. Logs not less than 14 inches in diameter, not over 24 feet long or not less than 12 inches in diameter, and over 24 feet, sound, reasonably straight, free from rotten knots or bunch-knots, and the grain straight enough to ensure strength.

No. 3. Logs having visible defects, such as bad crooks, bad knots, or other defects that would impair the value and lower the grade of lumber below merchantable.

Culls. Logs lower in grade than No. 3 shall be classed as culls.

Spruce, pine and cottonwood:—

No. 1. Logs 12 feet and over in length, 30 inches in diameter and over up to 32 feet long, 24 inches if over 32 feet long, reasonably straight, clear, free from such defects as would impair the value of clear lumber.

No. 2. Logs not less than 14 inches in diameter and not over 24 feet long, sound, reasonably straight, free from rotten knots or bunch-knots, and the grain straight enough to ensure strength.

No. 3. Logs having visible defects, such as bad crooks, bad knots, or other defects that would lower the grade of lumber below merchantable.

Culls. Logs lower in grade than No. 3 shall be classed as culls.

Diameter measurements, wherever referred to in this schedule, shall be taken at the small end of the log.

After December 31st of this year all logs west of the Cascades will be graded according to these rules.

Grading Service Valuable to the Mills

Where mills depend upon the purchase of logs in the open market to the same extent as they do at present on the Coast the grading of the logs is a valued service. It enables the purchaser, upon the receipt of a scale bill, to determine whether a boom of logs fills his requirements or not. Manufacturers of clear cedar lumber cut as many No. 1 cedar logs as possible, shingle manufacturers are in the market for No. 2 logs, mills with orders for low grade material can afford to buy No. 3. The grading also affords a definite basis upon which to deal with the logger, prices being fixed for each grade when the sale is made. It is left to the Forest Branch to determine the quantity of each grade in the boom. Fir and spruce logs have been graded for several years. Cedar grades were not established until this year.

Twenty-seven years ago a law was passed in British Columbia reserving against sale or settlement all land west of the Cascade Mountains averaging over 8,000 feet of timber per acre, and all land east of the Cascades averaging over 5,000 feet of timber per acre. The purpose of this law was to reserve this timber land for administration under forest laws which would ensure that the full profit from the sale

of timber, as well as permanent control of the timber, should be retained for the Government.

The administration of such a law requires field examination to ensure that timberlands are not taken up wrongfully. The field examination is supplied by the Forest Branch. In the Coast District all homestead applications and applications for land purchase are referred to the Forest Branch for examination before action is taken by the Lands Department. In this way the double purpose is served of restricting settlement to lands suitable for agriculture and of preventing the alienation of valuable timber. There are now several field parties of cruisers engaged in this work on Vancouver Island and on the mainland coast between the International Boundary and Cape Caution. This cruising of the remaining public timber is showing plainly, that even in the Coast Districts, where the largest areas of leases and licences have been taken up, there is still a great amount of merchantable timber belonging to the Government.

Upon the expiry of timber licences or leases the land included remains under forest reserve. As the Forest Branch has no desire to keep land under reserve which may be more valuable for other purposes, all such lands are examined and if agricultural are opened for settlement promptly.

In the Northern Interior a similar policy is being followed to protect the large bodies of merchantable timber, now belonging to the Government, which are known to exist. The areas which have been reported as timberland are being examined by special forest reconnaissance parties. The results of this reconnaissance will be to place under forest reserve the lands carrying merchantable timber and the lands unfit for agriculture. Districts into which settlers and land lookers are now going are being examined ahead of settlement with the same purpose in mind.

The advantages of such a policy are self evident. The timber land, which is the chief source of revenue, is protected from spoilation by private individuals under guise of settlement and from the fire hazard which settlement in timber lands always causes. The timber lands, thus held under the control of the Government in compact bodies, are available for any industries which may now, or in the future be seeking new timber supplies. The whole revenue from the timber then goes to the public. Another advantage is the restriction of settlement to agricultural lands. Settlers coming from new countries in a hurry to locate on land are not always in a position to determine what is agricultural and what is not, and very often take up land which a resident of the country knows is unfit for agricultural purposes. The experience of the older provinces has been that settlement on non-agricultural land is a direct loss of wealth to the community. The settler on non-agricultural land exhausts his capital, wastes his time and produces non profits; the only possible crop for such land is timber. For this reason an endeavor is being made to guide settlement in British Columbia.

The examination of timber areas tributary to the Grand Trunk Pacific has shown the presence of thousands of square miles of spruce timber equal if not superior in quality to the spruce timber of Ontario and Quebec. This timber is now accessible and affords a first class supply of raw material for pulp or lumber. There is at present practically no timber indutsry drawing upon the resources of this new region. The completion of the Grand Trunk Pacific and the influx of population are certain to deveolp the timber industry. New mills are now building and several enquiries are before the Forest Branch for the purchase of stumpage.

Ascertaining the Timber Wealth of the Province

There is no definite knowledge of the quantity of timber in British Columbia. The most generally accepted estimate is 350 billion feet, over one-half the total estimated for Canada. It is important that dependable knowledge of the forest resources and forest possibilities of the Province should precede the development of forest policies.

At the suggestion of the Forest Branch the Commission of Conservation has placed two experienced men in the field mapping and estimating the timber resources of British Columbia. The co-operation which is being secured from lumbermen who furnish copies of maps and estimates of their holdings, from the Dominion Government and from the Canadian Pacific Railway, is aiding greatly in the survey. The Forest Branch is making available all knowledge which has been secured from every source. The publication of this report in one or two years will show the true character of Western Canada's timber supply.

Forest conditions in British Columbia have decreed that forestry shall, in the beginning, be restricted to forest protection, a business admistration of the timber resource and a reservation for timber purposes of heavily timbered, or non-agricultural land. As logging operations increase, and stumpage becomes more valuable the regulating of logging operations on non-agricultural lands, so as to encourage a valuable natural reproduction of forest trees, will become more necessary and more possible. Before such regulations can be attempted a thorough knowledge must be secured, both of the conditions affecting the natural reproduction of the various commercial species, and of the cost and effect of such regulations of logging operations as may be expected to favor different species. It is first necessary to know what theoretically is the method to pursue to secure the reproduction of the most valuable timber species. Then it is just as necessary to give careful study to the cheapest possible method of producing, during the logging operations, the natural conditions which the different species desire for this development. The habits and requirements of trees vary in different regions. A start is now being made in the study of the reproduction requirements of the valuable timber species of British Columbia. Through a co-operative arrangement with the Dominion Commission of Conservation, Dr. Howe of the Staff of the University of Toronto Forest School, is taking up, this summer, on the Coast, a study of the conditions affecting the coming in of Douglas fir after logging operations. Douglas fir is the most valuable Coast species. It is important that a Douglas fir forest should follow on every logging operation where Douglas fir will thrive. It is believed that a satisfactory reproduction can be secured by a thorough broad cast burning of slash. There may be other conditions affecting the reproduction of this species which will be determined by this season's work.

As the knowledge of the habits of different species is gained definitely, clauses will be inserted in the timber sale contracts issued by the Forest Branch which will require the ground, when logged over, to be left in a condition favorable to the most important species occurring on the tract. As rapidly as is justified by the results of this policy on timber sales, modest regulations seeking the perpetuation of valuable forest will be put into effect on lands held by other forms of tenure.

This rough resume aims to give merely an outline of the first steps being taken to put forest administration upon a sound basis in British Columbia. The prime essentials are considered to be adequate forest protection, and efficient forest administration. Upon these, with a further knowledge of the forest interests, forest conditions and forest industries of the Province will be built a policy aiming more accurately at the perpetuation of the forest.

How the War Affects U. S. Trade

The possible result of the war, in connnection with trade in the United States is analysed by the American Lumberman as follows: There will be a serious drain upon the financial resources of Europe and a severe liquidation of American securities held abroad. There will be heavy withdrawals of gold from this country, which have already begun, and how far the new currency system of this country will be able to replace coin with reserve bank currency, supported by the credit of the Government, remains to be seen. The farmers of Europe are called upon to reconvert their plow shares into swords and are being mustered from grain fields ripe for the harvest. The bountiful crops of the United States will be needed to feed soldiers, and there will be an increase in prices of foodstuffs which will give to the crops of 1914 a materially enhanced value and make them a larger national asset. In as far, however, as they enter into domestic consumption this will be an added tax upon the ultimate consumer and only the proportion going to export will enhance the nation's wealth.

There will of course be a serious interference with the peace demand of Europe for our wares that will be only partly compensated by the needs of war, and particularly along certain lines. An analysis of our export figures may be of interest in this direction. It shows that for the eleven months ending May, 1913, the United States exported to those European countries which will be more or less directly concerned in hostilities $1,095,785,562 worth of merchandise. To the rest of Europe our exports were $300,402,373; to the rest of the world, $811,319,169. It is probable that our exports to the neutral portion of Europe would be seriously ditsurbed in the event of war. Much of our merchandise, however, sent to England, Germany and France is redistributed to other than European countries and our direct export trade to these other countries would probably be enhanced should the three nations in question become so involved in conflict as to shut off their commerce upon the seas.

As to the products of our forests, there would be some requirements for military operations, but by no means compensatory for the vast decrease in building and manufactures in European countries which active war would cause. For the eleven months ending May our exports to France, Germany, Italy and the United Kingdom amounted to $5,568,770 in timber and $15,956,704 in sawn lumber. To the rest of Europe our exports were respectively $1,518,730 and $5,877,632. To the rest of the world we sold hewn, sawn and round timber aggregating $1,112,256 and lumber totalling $31,215,990. Europe has therefore taken about 40 per cent. of our exported sawn lumber and over 85 per cent. of the material exported in the forms of logs and sawn or hewn timber. Our trade in furniture and other wooden pro-

ducts will not be so seriously involved, as our sales to the four countries over which the war cloud hangs heaviest amounted to $641,834, and to the rest of Europe, $633,660, whereas the rest of the world purchased furniture in these eleven months amounting to $4,943,351.

Another feature that will directly influence business in the United States is the drain of foreigners liable to military duty. Austria and Servia have both furnished large amounts of the labor used, particularly in mining, but also in factories and in sections of the country engaged to some extent in various activities of lumber manufacture. There is already a movement of these foreigners toward the father country, responding to the call for reservists. If Russia, England, Germany and France should require their full fighting strength there will be further migration from this country, which will make labor scarce and undoubtedly have some effect in increasing wages.

War is always a world calamity and the entire world must to some extent suffer the resulting waste and loss. In the United States, however, the depression caused by European war would probably be a later effect except in the financial world. In merchandising and manufacturing the earlier result might for some time be increased activity, although hampered to a considerable extent by contraction of the nation's capital resources.

Fortunately, war in Europe is linked with prospects of an early peace in Mexico, which will mean a large demand for lumber for many purposes of rehabilitation and resumption of business activities.

B.C. Lumber Trade Troubles Analyzed

Are Short Sighted Business Ideals Creating or Magnifying To-day's Depression? —A Silver Lining Visible to Those Who Look For It

Editor Canada Lumberman: Vancouver, B.C., July 20.

In your statistical issue of February last, I made certain predictions regarding the outlook for the lumber business in British Columbia during the present year, and I am now glad to be able to say that, while there was more optimism shown in those predictions than some were willing to admit was warranted by reading the signs of the times, yet, as I stand to-day, half-way along the trail as it were, with half the time covered by those predictions expired, and view the year's business both past and prospective, I feel that I have nothing to recall from what I said at that time. It is true, as some will doubtless state, that business is not as good as we would like to see it, but, as a matter of fact, this same thing has been felt by some to be true at almost any time in the history of the lumber business in British Columbia, and I think the day is yet far distant when we will all be satisfied. This temporary season of inactivity from which we are just now emerging, following as it did a season of unparalleled activity, naturally makes things seem slow in every line, and the only reason why the lumber business seems harder hit than others is, that it is the chief industry, and even though it did seem rather dark for a time, yet things never were so bad that they might have been worse.

Is There a Silver Lining?

Despite the optimism shown by such writers as yours truly, however, there are some who persist in refusing to see any silver lining under the cloud which has been overshadowing us, and of course, to such I can only quote the words of one who is greater and wiser than I, and who said, "According to your faith be it unto you." It is true that none of the manufacturers of British Columbia are likely to be over-burdened with profits this year, but it is a gratifying indication, to see that, even in times like these, when so many are crying out in pessimistic phrases, few lumbermen have shown a willingness to lie down and "die." Did it ever occur to you, my friend in the trade, that when you go about shouting blue ruin you are doing your part to bring about exactly that state of affairs? Nobody will ever enter heaven by proclaiming certain victory for the devil, neither will we ever enjoy the prosperity which is within our reach unless we quit crying ruin. You might paint a parrot in such a way as to imitate any other bird that you saw fit, and yet the moment it opens its mouth you know it is a parrot. It is the same with many lumbermen if you will pardon me for saying it. They have become so accustomed to viewing things through pessimistic lenses that their eyes have got a slant that way and they cannot see otherwise. They hear someone talk ruin and so they talk ruin. Such men are not given to using moderation in their statements either, but will tell you that the mills in British Columbia never made any money. They will state that they are in the grip of the banks, and are compelled to operate, and that they are only standing off the "evil day." I have heard that story for the past twelve years, and while in certain instances there may have been some truth in it, yet some of those same mills which were pointed out to me then are still doing business. I have come to the conclusion that they must be fond of losing money, and also that our banks must be decidedly "easy" to supply it to them.

Let us not emulate the parrot any longer. There is a considerable volume of business being handled whether you are willing to admit it or not. I think I hear someone remark that any business which is now being transacted is taken at such prices that the greater the volume the greater the loss. This sounds like our friend "poll" again, but if it is not, then I would ask who is to blame for this? Are you ready to admit that the buyer is smarter than the seller, or is it that you are so anxious to grab business from a competitor that you are willing to handle it for nothing or worse? We all know of course, that the lumber business is suffering from some organic weakness which it seems hard to cure, but as a certain number of fleas are said to be good for a dog, so it may be that these weaknesses are necessary to the well-being of the lumber business. Who knows but that without them it might become too prosperous and people would then leave every other pursuit to engage therein? But seriously, when I see a fellow grab $18.00 business at a $12.00 or $13.00 price, and other business in like proportion, only to discover the intricacies of the order and the consequent additional cost thereof after he has committed himself, I can only pity him. He probably would do better if he understood, but it must be remembered that the lumbering industry has grown and developed very rapidly, and many have been drafted into the ranks who are not lumbermen, and without the requisite of practicability in any profession, men sometimes fit their positions about as well as a round peg in a square hole. For these things, and peculiar as it may seem they are by no means uncommon. The lumber business has to suffer, and to-day, practically stands condemned by some to the nethermost depths of incompatibility, when in reality it is not the fault of the business at all, but is rather the fault of those engaged therein. Most of the evils which we meet in life are of our own making, and yet strange as it is true, we are seldom able to see it that way. I tell you friends that he who condemns the lumber business does wrong. I know of no more worthy calling in which to be found engaged, nor do I know of one more remunerative than this could be made; but let me qualify this statement by saying that, to make it a sound proposition, there are certain positions which should be filled only by practical men, which too often are not so filled.

Trade Ethics a Large Factor

There is another evil which is particularly troublesome at the present time, and which is, to some extent, sapping the life of the lumber business, and that may be properly named the "tricks of trade." I believe that nearly every firm doing business to-day knows what I refer to, for who is there who can say that their shipments are as satisfactory to-day as they were two years ago; and yet are you not exercising greater care now than you did then? The buyer is taking advantage of your natural inclination (at such times as those from which we are emerging) to not break any ties which bind your trade relationship, and so he presses his claims for rebates upon the pretence of some alleged defect, or shortage. In most cases the mill is not in a position to investigate, and so the claim is allowed; but is it honest? Just as all kinds of complications set in upon a man whose physical strength is exhausted, so it seems in the lumber business, and while there are many millions of dollars invested in the business in this province, yet with all this monetary strength, we are, if not dying from the effects of our inability to cope with the situation, surely showing such signs of weakness that the attacking enemy which is ever crouched upon our trail watching for an opportunity, now springs upon us to grab that which he would not dare to ask for, if we only had strength and sufficient business acumen to stand together and demand our rights. What is good for one is good for all who are similarly engaged, and yet, while the trail has been well and truly blazed in days gone by in other parts of the Dominion, yet we in British Columbia seem to be constantly watching for some by-way upon which to run off and lose ourselves. It may be that everybody wishes to be a leader, and that none wish to follow, or it may be lack of respect for the other fellow's views that causes our inability to get together and protect our business. I believe though, that it is nothing more nor less that shortsighted greed that sways us to the extremity of grabbing, at a loss, that which we could just as well have at a profit. There is wisdom in council; but the man who stands ready to betray his own interests along with those of his fellow man to satisfy a blind greed will never find it.

While I have dealt only with the lumber interests in this article, yet I do not wish the shingle interests to feel slighted, but wish to assure them that they are welcome to apply the words written herein to themselves just as far as they wish, and in conclusion I will say to all that it is time to awaken up, and if necessary, pinch ourselves to see if we are alive, for surely we have been asleep to our interests long enough.—E. H. Newton.

The Red Cedar Shingle Industry of B.C.

Economic and Industrial Conditions Giving the Western Province a Leading Place in this Great Industry

By C. W. Scarff.

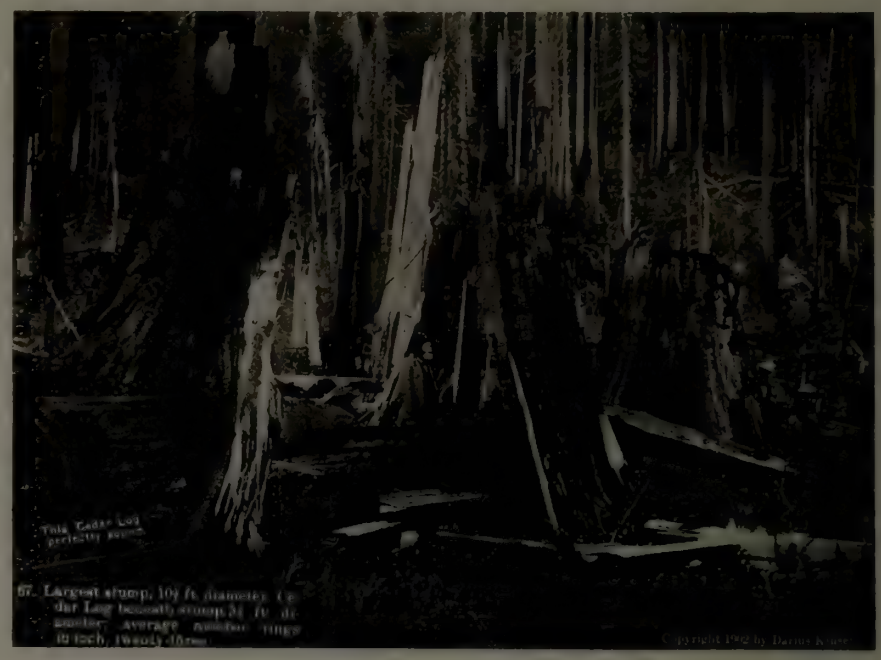
The Shingle Packer.

British Columbia is now the home of the Red Cedar industry on the Pacific Coast. This may sound more like a prophecy than a statement of truth in view of the fact that the States of Washington and Oregon are credited with three-fourths of all the shingles made on the coast, which means the bulk of all the shingles made in North America, but it must be remembered that great industries have their rise and fall, their coming and going, the same sa individuals that outgrow their limitations in one section, and, therefore, move bag and baggage to a newer and less exploited section of the country. Thus we see these great industries starting in British Columbia financed and equipped by men from the Eastern Provinces, the United States and from over seas. The shingle business being a bi-product industry, thrives best where the raw material is abundant and low-priced. The lumberman and logger goes after the standing timber, but the shingle manufacturer follows as a gleaner follows the harvest of grain.

There is necessarily a great waste left in the trail of the western logger, as may be seen in one of the accompanying illustrations of logged-off land. This picture was taken after we finished logging a tract and after a fire had gone over it destroying and eliminating small limbs and underbrush. This shows about the average conditions that bolt cutters have to contend with. Burned over logged-off land presents a desolate, hopeless picture to any one not acquainted with its possibilities, but the shingle manufacturer here on the coast sees a fortune in it. I have known instances where the shingle mills cleaned up more money from the manufacture of shingles taken from the scavengered stock of snags, dead trees and fallen logs, than the original lumberman who logged the timber a few years ago during the period of depression.

An Age Defying Timber

Large old-growth cedar, if sound, will withstand the elements, such as fire, wind and rain for centuries. Windfalls and broken logs covered with moss and ferns remain sound and can be cut into shingle bolts hundreds of years after the trees are fallen. This statement may seem overdrawn to many of your subscribers but it is perfectly true, as may be seen in picture from another of the illustrations.



Embalmed by nature—Sound cedar log pinned to ground by a large stump.

Here is an instance where a mammoth cedar log laid prone on the ground for a long number of years, while the moss and decayed leaves were forming a seed-bed in which the tiny cedar sapling took root and grew, finally sending its roots down around the trunk of the mother tree into virgin soil, and then to grow year by year, adding ring after ring of new growth, until the record shown on the face of the stumps proves beyond doubt that these trees had stood guard over the prostrate form of the mother tree for five hundred to seven hundred years. The logs, taken from these stumps, were cut and hauled away about 12 years ago, and since that time bolt cutters have cut the fallen tree into shingle bolts, bright, clean, clear stock that will make shingles equal in every way to green cut bolts. This picture was not taken on my own land but was kindly contributed by Mr. Darius Kinsey, who found this rare example in Skagit County, Washington, near Sedro-Woolley, while out in the woods photographing timber views. I have seen many instances of large trees growing astride of fallen cedars but this is the most remarkable illustration I have ever seen.

Not all of our shingles are made from the gleanings of logged-off land. Some mills buy their cedar standing, and cut it into bolts or blocks using the whole tree for shingle stock, but this cannot usually be done on account of the high-price of cedar logs. Some lumber

A combination Lumber and Shingle Mill.

Logged-off land—The shingle maker's harvest field.

mills sort their cedar logs, cutting all the clear stock into boards and bevel edge siding, throwing all the poorer grades of the log into shingle stock. Our shingle mill shown in one of the illustrations is what we call a "combination mill," one that cuts both logs and bolts. The logs come out of the water over a log slip on to the saw carriage and are there cut into lumber, while the shingle bolts are drawn up by endless chain in another slip to the cut-off saw, where the bolts are reduced to shingle length, trimmed by the "knee bolter," thus getting rid of bark, sap and uneven surfaces before passing on to the shingle sawyer. The work of preparing the blocks for the sawyer is all done by day labor and does not require as much skill in operating as it does physical strength. The sawyers and packers, however, are paid by the "thousand shingles" as cut, and this operates as an incentive to keep busy. A good sawyer can cut from 25,000 to 35,000 shingles in ten hours on an upright machine.

In respect to the cost of producing shingles in British Columbia, much, of course, depends on the location of the mill and the experience and ability of the owners. During the past seven years of depression in the lumber business, the shingle men of British Columbia have nearly all made good, while in the States there have been many failures and shut-downs. We make a better shingle—better timber to work with and better-made than the States shingle. Sixty per cent of Washington shingles are what the trade terms "Star A Star," a 6-2-16 shingle, more or less imperfect above the weather line of exposure when laid. Here we make no such brand. Practically all shingles sent to the market from here are clear of knots and imperfections and we are building up an expanding trade on Eurekas and Perfections—longer, thicker shingles than the ordinary Clears. Many of our mills employ Oriental labor at a lower wage than white labor, but as that is a mooted question of economy and a very doubtful question of policy, I will pass it without comment.

There are several causes that lead up to the present activity in the shingle industry in British Columbia. For several years the lumber and shingle business has been in a more or less unsatisfactory condition caused by prevailing low prices. Washington and Oregon, operating hundreds of shingle mills, many of them double shift, day and night, turned out a vast number of shingles thereby overproducing, considering the demand. British Columbia mills, comparatively few in number as yet, had very little market outside the Canadian provinces. The Aldrich-Payne Tariff of 50c. per thousand shingles operated as a barrier, well nigh prohibitive to building up any considerable trade with the United States. The general tone of business of all kinds was discouraging, but late in 1913 the American Congress removed the duty on lumber and shingles entering from Canadian ports. This gave the Canadian manufacturer an open door into a much wider market than he had hitherto enjoyed. American shingle manufacturers, who were running short of cedar timber, naturally went across the line into British Columbia where they could find an abundance of raw material at a reasonable price. British Columbia is a new province and scarcely a start has yet been made in removing her vast forests, and, consequently, better locations can be had for erection of mills than in the older communities of Washington and Oregon where the timber has mostly been cut away several miles back from railroad or water front. To sum up briefly, the situation seems to be as follows:

Shingle manufacturers in the States are confronted with a decreasing supply of shingle timber at high stumpage rates. Water shipments through the Panama Canal from American ports are controlled by American shipping at higher transportation rates than tramp steamer-competition on this side the line. British Columbia shingle manufacturers have sufficient supply of excellent cedar along the railroads and water fronts, at low stumpage cost, to run their mills for a long term of years, and it seems they now have the whole world for a market in which to exploit their goods.

Canada's Lumber Production During 1913

Bulletin Prepared by Forestry Branch Indicates that Output has Passed its Highest Point—B. C. Now the Leading Producer

A bulletin giving statistics of the production of lumber, lath and shingles by 2,187 mills operating in Canada during the calendar year 1913 is being prepared by the Forest Branch of the Department of the Interior, Ottawa. The figures for 1912, which were gathered from 2,558 mills are being included for comparison. The bulletin will state that the total value of lumber, square timber, lath and shingles produced in Canada in 1913 was $70,644,362, the separate items being, lumber, 3,816,642,000 feet board measure, valued at $65,796,438; lath, 739,678,000 pieces valued at $1,783,283; and shingles, 1,485,279,000, valued at $3,064,641.

Lumber Production Decreased

The total production of lumber in Canada in 1913 was a decrease of 13.1 per cent from that of 1912. The 1912 production was a decrease of 10.7 per cent from that of 1911. It is evident, the bulletin says, that the climax has been passed and that the production is now declining at about the same rate as it increased up to 1911. The cut of lumber in 1911 was 4,918,202,000 feet board measure valued at $69,475,784. The climax of production in the United States was reached in 1909 when 48,112 mills cut 44,509,761,000 feet of lumber or about nine times as much as was produced in Canada in the climax year of 1911.

Canada cut in 1913 a total of 3,816,642,000 feet board measure of lumber valued at $65,796,438. The cut in Ontario decreased by 20.5 per cent while that of British Columbia decreased only 10.7 per cent. This resulted in a change of relative position, which puts British Columbia at the head of the provinces in the production of lumber, and Ontario, which has headed the list in the past, falls back to second place. An increase in production in Manitoba of over 82 per cent brings this province up to seventh place and drops Alberta to eighth place.

Reductions in the cut of lumber are to be noted in every province except Manitoba, the greatest reduction taking place in Saskatchewan.

The average price of lumber at the mill throughout Canada increased by $1.41, increasing in British Columbia, Ontario, Quebec and New Brunswick, and decreasing in Nova Scotia, Manitoba, Alberta and Prince Edward Island. The greatest increase in price $4.08 took place in Ontario.

While spruce still formed about a third of the total production some important changes have taken place in the relative order of the different kinds of wood cut. The cut of white pine decreased by over a quarter while that of Douglas fir decreased by only 10.9 per cent. Douglas fir consequently moved up to second place on the list.

The cut of red pine increased by 1.4 per cent while that of cedar decreased by 35.2 per cent. Among the ten most important woods the greatest decrease occurred in the case of cedar and the greatest increase in the case of tamarack. Among the hardwoods the changes in relative position are more frequent, as those woods, with a few exceptions, are cut from isolated stands and lands that have been lumbered over for pine, spruce and hemlock in the past. The supply of such woods is very variable from year to year.

Willow and ironwood which were cut in 1912 were not reported in 1913. Sassafras which has not been reported since 1911 was cut in 1913. Some of these woods, black gum, tulip, sycamore and sassafras are cut occasionally in very limited quantities in southwestern Ontario, mostly on the Niagara Peninsula and along the north shore of Lake Erie. They belong rightly to the hardwood forest of the central United States and cannot be considered as typical Canadian species, as their range is so restricted and their occurrence so comparatively rare in Canada.

The first five woods on the list increased in price at the mill from 1912 to 1913. Out of the total of twenty-seven, only nine were reported at a lower price than in 1912.

A Drop in the Output of Shingles

The decrease in the shingle cut in Canada from 1912 to 1913 was 5.9 per cent, as compared to 14.1 per cent from 1911 to 1912. The cut decreased in British Columbia, Ontario, Nova Scotia, and Prince Edward Island, and increased in Quebec, New Brunswick and Manitoba. Alberta did not report any production in 1913, but Saskatchewan reported a small quantity.

British Columbia produces more shingles than any other province and in 1913 all these were made from one species, western red cedar. In Quebec, over ninety-seven per cent of the shingles were made of eastern white cedar. Other less important shingle woods in Quebec were spruce, white pine, balsam fir, jack pine, hemlock and aspen poplar, named in their order of importance.

In New Brunswick, cedar forms 98 per cent of the total, the remainder being made up of spruce, balsam fir, hemlock, white pine, red pine and aspen poplar.

Ontario manufactures a large proportion of her shingles from white pine although cedar heads the list in this province. Shingles are also made in Ontario of hemlock, red pine, spruce, poplar, balsam fir, butternut and jack pine.

In the three Prairie provinces, as well as in Nova Scotia and Prince Edward Island where cedar is practically unknown, the shingles are made for the most part of spruce, with smaller quantities of balsam fir and jack pine in the west, and cedar, balsam fir, hemlock,

white pine, jack pine, aspen and birch in the two Maritime provinces mentioned.

With cedar forming 93.7 per cent of the total production of shingles in Canada, the other woods on the list are of little relative importance. Of the total for cedar, 748,626,000 shingles were made from eastern white cedar, as compared with 643,484,000 from western red cedar from British Columbia.

The other woods on the list are used because they are cheap and abundant in the region where they are manufactured, or because they form a part of the mill waste which can be profitably manufactured into shingles. In very few cases are they chosen on account of any quality they possess that fits them for shingle woods. Wherever cedar can be obtained in quantity in Canada it has been, and probably will be, the favorite material for this purpose.

Lath Production Reduced

The decrease in lath production in Canada from 1912 to 1913 was 17.7 per cent , as compared with 6.9 per cent from 1911 to 1912. Laths are usually a by-product to the lumber industry insomuch that they are almost invariably made from slabs, edgings and other material that would otherwise be burned as waste in the sawmills. Changes from year to year in the production of lath follow those in lumber production very closely.

Saw mills in Ontario are able to make a closer utilization of their material than those in British Columbia and consequently produce more lath, although the British Columbia mills produced more lumber in 1913.

The relative importance of the different kinds of wood used in the manufacture of lath is very similar to that of the woods sawn into lumber. Spruce lath are made in greater quantities in New Brunswick where spruce is the most important lumber species. Over ninety per cent of the white pine lath are made in Ontario.

Changes Required in B. C. Business

Representative Lumbermen to Interview Sir Geo. E. Foster —Mr. Henry Pearce Outlines Situation

Arrangements have been made by R. F. Green M.P. for Kootenay, for a conference between the lumbering interests of British Columbia and Sir George Foster, minister of trade and commerce, the date to fall during the forthcoming visit to the province of the minister, who will be touring the west as a member of the Dominions Royal Commission. Conditions affecting the lumbering industry in British Columbia have been the reverse of satisfactory, the financial depression having had as one direct effect the serious curtailment of orders from the prairie provinces, due to the cessation of building operations.

In an interview on the proposed conference Mr. Henry Pearce spoke recently of the present status of British Columbia timber in the markets of the wold.

"Mr. R. F. Green, M.P., I understand, has specifically suggested the appointment of a number of commissioners to be sent to the different importing centres to try to stimuulate a demand for Canadian lumber," said Mr. Pearce.

"During the last few months I have been in direct communication with some of the leading important lumber merchants throughout the world. I have found that although it is, of course, urgent that the different importing countries should have a full knowledge of the merits of British Columbia timber, it is more important, in fact imperative, that the Government should endeavor to solve the question as to how the British Columbia exporter can finance his export trade. If the freights are going to be put through San Francisco, financing put through American banks and cargoes arranged by American brokers, Canada will never hold the position in the lumber world she should have. Some action must be taken immediately, as statistics will show that we are still going back every month, and soon it will be as difficult to transfer the lumber trade from American ports to British Columbia as it would be to transfer the cotton trade from Manchester to Southampton.

"The appointment of grading and tallying inspectors who will give a certificate over the seal of the Department of Lands, is an all important first step, and it would induce the banks to finance up to the full values of the cargoes.

"Under present conditions, English houses are generally prepared to accept drafts for 75 per cent. value of cargo; this would mean that for a broker to make a gross commission of $25,000 a year, selling $1,000,000 worth of timber at 2½ per cent. commission, he would require a working capital of $250,000.

"Immediately the export trade is put on a commercial basis the banks in British Columbia would only be too eager to compete for the purchase of drafts at full value. It is Canadian commerce we want to establish, not only Canadian trade. The word 'trade' comes from the old English 'trod,' and was used in the sense of a beaten track—hence trade winds, the wind which always blows in one course. The word 'commerce' is from 'cum'—together and 'merx'—merchandise, in its general acceptation the international traffic in goods or what constitutes a foreign trade of all countries as distinct from the commercial trade. The policy of Sir Richard McBride has given us railways, Nature has created seaboards, and timber, as the basis of British Columbia commerce, is going to make a nation within a nation. The position must be considered from this commercial basis, not from a political or 'village pump' point of view.

"The demand for Canadian timber is not going to be stimulated by commissioners going abroad and simply talking the merits of Canadian timber; there is important diplomatic work to be done by men who are thoroughly conversant with local conditions and have the initiative brain to evolve a scheme whereby Canada can deal direct with foreign buyers on most favorable conditions.

"The Canadian Trade Commissioners have, during the last few months, been making exhaustive inquiries into this subject, based on their personal knowledge of the countries to which they confine their reports.

"These commissioners are all agreed that B. C. is not getting a small percentage of the export trade it should have. They can offer no opinion as to why this trade is not forthcoming as they all assume, quite rightly, that the Canadian lumberman should not be inferior in resource, intelligence or energy to his competitors the other side of the line.

"For instance," said Mr. Pearce, "Mr. H. R. Pousette reports as Canadian Trade Commissioner in South America, under date June 1: 'Out of a list of 125 vessels chartered a year ago, only two cargoes were shown as originating in British Columbia, the others were from Puget Sound or Columbia River ports.'

"I have before me a letter from one of the largest importers in Australia, dated May 13, 1914, an extract from which says: 'Some time back members of the trade were prejudiced against Columbia River Oregon but this is dying out!'

"If we can only tell importing countries of the world that Douglas fir is not Columbia River Oregon, but timber grown in British Columbia, and can be shipped, inspected and passed by the British Columbia Government, financed by British banks, sent in British bottoms, and sold through British firms, we are starting that B. C. commerce which we hope will be such a factor in making British Columbia's prosperity in the near future.

"To anyone who has not considered the subject, it might be argued that the lumberman should be able to market his own goods without the assistance of the Government, but it has to be considered that Canada is a young country. It is in a state of development, whereas America had developed a generation ago. The Americans have now such a grip of the export trade that it would be impossible for an individual man or an individual corporation to enter into competition successfully. It would not be possible for the lumber merchants and timber owners to enter into any kind of 'combine,' for the reason that such a combine must of necessity include shipowners, lumber brokers and freight speculators. If, however, the B. C. and Dominion Governments were to support the lumber industry officially by establishing an Inspection Bureau, such as I suggested, and would then go further by sending an official representative to the different trade centres, for the purpose of interviewing shipowners, banks, merchants, and other people interested in the lumber trade, who would send his reports and suggestions both to the Governments and the Lumbermen's Associations, the lumber trade would have the necessary impetus to enable it to enter into competition for the world's demands. The expence necessary in sending a competent man abroad would be very small, and the diversion of a few of the cargoes mentioned in Mr. Pousette's report would indirectly bring to Canada in actual profits more than any expense that could possibly be entailed.

"The Canadian Trade Commissioners have undoubtedly done very good work in getting particulars of the lumber industry in their several countries, but it cannot be expected from them that they should have the necessary business qualifications, the local knowledge of the lumber industry, and the commercial traveler's instinct that a qualified man should have who would be sent abroad by the Canadian Government to establish commercial relations with the best of lumber importers. It is not a question of British Columbia trying to resuscitate a dying industry, that of exporting lumber. We want to tell the world that, anticipating the opening of the Panama Canal, we have opened up the country with railways, built and equipped ports, passed laws this year regulating the cutting of timber, whereby the country has an actual financial interest in its timber wealth, opened a department whereby all exports of timber will be inspected by the Government, and are now in a financial position to export our manufactured timber.

"It is a very important period in British Columbia's commercial history," concluded Mr. Pearce, "and the manner in which the export lumber question is tackled during the present year must have a direct result on its future prosperity."

Port Moody's Fine New Shingle Plant

Robert McNair Shingle Company Now Operating One of the Most Up-to-date Mills on the Coast and Conducting Their Own Logging

At Port Moody, B.C., the Robert McNair Shingle Company, of Vancouver, have commenced operating their recently completed shingle mill, which they consider to be about the finest shingle mill on the Pacific Coast. They have opened up their own logging canps and are taking out timber from the "virgin forest, great big green healthy cedars of the finest quality in the land," and they expect to turn out some shingles which will "make the Ontario dealers rejoice." In their logging camps they have introduced some important features. For instance, instead of erecting one long bunk house, they have cabins which accommodate four men each. This they consider to be more sanitary, and the nen take much more interest in keeping them tidy. Moreover, the men do not have to mix indiscriminately in a bunk house with others for whom they have no liking.

Referring to the shingle mill and dry kilns, which are shown in one of the accompanying illustrations, the company state that the picture shows on the left the conveyors to the refuse burners. The first small building is the blacksnith shop. The next building is the boiler house, which is of entirely fireproof construction, being built on a concrete base with steel frame and corrugated iron covering. The power plant consists of two 72 in. by 18 ft. boilers set in "Dutch ovens." The boilers were built by the Vulcan Iron Works of New-Westminster, B.C. The engines are a pair of 16 x 18 Waterous engines. The next building shown in the illustration is the shingle mill. This is a 12-machine mill, laid out in two parallel rows with block conveyor between. The shingle bolts are cut up by means of a 4-saw slasher, thus ensuring shingles of uniform length. The shingles, after being packed into bundles, are loaded on to trucks immediately back of each machine. These trucks when filled are noved along into the dry kilns. The process of drying takes about eight or ten days and the trucks come out in the loading shed, shown at the right of the illustration, where the shingles are loaded into cars for shipment to the markets of Canada and the United States (chiefly Ontario) where the output is handled by the R. Laidlaw Lumber Company, of Toronto. The logs shown in the pond in this illustration are Douglas fir, for which British Columbia is famous. These are cut in lengths of 32 and 40 feet chiefly, and average about 2,000 feet per log, grading about fifty per cent. clear.

The Logging Operations

The other illustration shows the base of logging operations in the woods, of the Robert McNair Shingle Company, on timber berth No. 38 on the Coquitlam River, 5½ miles from Port Moody. This timber berth has not been operated previous to the present year. It has been held by Mr. McNair for about fifteen years, and contains some of the finest cedar and fir timber in British Columbia. This illustration also gives an idea of the camps installed by the company. In their camp No. 1 they have 10 cabins, cook house and dining room, superintendent's cabin, commissary, blacksmith shop, filing shed, etc. The illustration also shows the road engine at the end of a pole road and the landing. Below the landing are a number of cars loaded awaiting the arrival of the locomotive. The camp equipnent includes two Tacoma yarding donkeys 10¼ x 12, one Tacoma road engine, 11 x 13, twelve Seattle logging trucks, six shingle bolt cars and one Kingston locomotive of the 0-6-0 type.

The logging operations are in charge of Superintendent John W. Crockett, who was previously with the Hammond Lumber Company, of Eureka, Cal., and who has an enviable record to his credit as foreman of camps in the Redwoods. The loconotive referred to above is of the oil-burner type, which can be operated with much more safety from fire in logging operations than a coal-burner, and with less cost for fuel.

Mr. Robert McNair is a man of about 55 years of age. He went to Vancouver from Restigouche County, N.B., about 24 years ago, and started in the shingle business, shortly after his arrival at the coast. He has been in the same kind of business ever since, and shingles bearing the McNair brand have a high reputation.

Mr. McNair is assisted in the management, particularly in the office affairs, by Mr. W. J. Miller, one of the younger generation of lumbernen, thirty years of age, who has been on the coast for two years. Previously he was manager of the Continental Lumber Company, at River Charlo, N.B.

The cabins which the men use during their logging operations are 12 x 18 feet with 8-foot posts. They have a door and window in the front and a window in the back. On one side there are four single bunks, furnished with mattresses. On the other side are a sheet iron heater, and a small table. Two extra bunks can be put in if required. These cabins cost very little more to build than the bunk houses, requiring about 1800 feet of lumber, one door, two sash, a few shakes for the roof, and about two days' labor for two men. The total cost is about $40 each, and when it becomes necessary to shift canp, these cabins can be loaded bodily on the cars and taken to the next stand.

Saskatchewan Production in 1913

The third annual report of the bureau of labour, of the province of Saskatchewan, which has just been published, contains interesting references to the lumbering and woodworking industries of that province. During the year 1913, the report says, two planing mills in the province were closed. Both these mills being in small towns and having but a very limited output, the result of their closing was more than offset by large additions to other mills especially one in Regina and one in Saskatoon.

The additions referred to are also responsible for the increase in the capital invested in this class of industry. In the following table it will be noted that while the number of employees and the number of days in operation is less than in former years, nevertheless the total value of the output shows a considerable increase. This fact was the subject of a special inquiry by the bureau with the result that nearly all the mill men interviewed stated that the class of buildings being erected in the province was gradually improving, and, as a result, the mills were turning out a much higher class of work which necessitated the use of the better and more expensive grades of wood.

New Plant of Robert McNair Shingle Co., Port Moody, B. C.

Base of Logging Operations—Robert McNair Shingle Co.

Therefore, while the total volume of work turned out did not equal that of 1912, yet it was of greater value, which fact is plainly shown in the large number of returns received by the bureau and which are set out in the following table.

	1911	1912	1913
Number of establishments	16	38	36
Capital including plant	$514,443.00	$1,331,960.00	$1,599,048.00
Average capital employed	$32,152.00	$41,570.00	$44,418.00
Number of employees	650	1,008	864
Total salaries and wages	$481,584.00	$816,984.00	$667,692.00
Annual average earnings per employee	$740.00	$810.05	$772.75
Average number of days worked	251	298	275
Gross value of product	$1,391,648.00	$2,295,594.00	$2,445,504.00

In its lumbering industry, Saskatchewan continues to hold sixth place, according to the value of output. The actual output of lumber during 1913 showed a decrease of 27 per cent, as compared with 1912. During 1912, Saskatchewan was the only province of the Dominion which showed an increase in the value of its production of lumber, this increase being 16.7 per cent. During 1913 the value of the lumber production in the province was $1,908,482, and the average value per thousand feet was $16.62, as compared with $16.12 in 1912. The following tables show the value of lumber production, the percentage of increase or decrease, and the average value for the years 1911, 1912, and 1913.

Year	Value of lumber cut,	Per cent increase or decrease	Average value per M. ft. B. M.
1911	$2,266,435	77.5	$16.82
1912	2,535,611	16.7	16.12
1913	1,908,482	27*	16.62

*Decrease

The report also contains a discussion of retail lumber prices in the city of Regina from 1910 to 1913. These prices are taken from the printed price lists issued by the lumber dealers of the city. The year 1909 was notable as a very competitive year in the retail lumber business of the province. Records of sales were reported showing a spread of $5.00 per thousand obtained for the same class of material from different buyers during that year, and for this reason it was extremely difficult to obtain even approximate prices for many materials.

During 1909 this keen competition had such an effect upon the business that beginning in 1910 an understanding as to prices would appear to have been reached by the dealers, with a result that a printed price list was issued to which a great majority of dealers strictly adhere.

This year's prices as quoted in the accompanying schedule are subject to a discount of 5 per cent. for cash, otherwise the figures shown may be accepted as actual selling prices of the various materials.

Averaging the retail price for the years 1910 and 1913 we find that the increase is approximately eight per cent.

Schedule

Dimensions	1900	1911	1912	1913	Per cent increae
1 x 2, 2 x 2	$29.00	$31.00	$31.00	$29.00	.....
2 x 4, 2 x 6, 2 x 8	25.00	24.00	24.00	27.00	.....
4 x 4, 6 x 8	27.00	28.00	28.00	30.00	3.44
Shiplap	26.00	26.00	26.00	28.00	3.56
Drop siding	38.00	38.00	38.00	40.00	.....
Common boards	25.00	25.00	25.00	28.00	3.70
Lap siding	35.00	35.00	35.00	40.00	11.11
Flooring 1 x 2, 1 x 3, 1 x 4	45.00	48.00	48.00	52.00	10.64
E. G. Fir No. 3	38.00	40.00	40.00	45.00	7.50
Ceiling, No. 1	40.00	40.00	40.00	43.00	7.50
V. J. ½ x 4	33.00	33.00	35.00	35.00	.....
Plaster	16.50	16.50	16.50	17.00	6.25
Lime	2.00	2.10	2.00	2.25	18.40
Hair	.35	.35	.35	.35	.....
Shingles	3.75	3.75	3.75	4.00	6.66
Lath	5.00	5.50	5.00	6.00	20.00
Paper	1.25	1.25	1.25	1.25	.....
Average	$22.99	$23.37	$23.46	$25.10	8.7

The foregoing schedule shows the actual selling price in Regina, and we are informed that the price usually obtained at the various small yards throughout the province is slightly in advance of the city prices, probably about $3.00 per thousand.

Four hundred and sixty thousand feet (nine hundred and ten logs) loaded on seventy cars in a nine hour day! That's five logs every three minutes through the day, or eight hundred and fifty-two feet a minute. This splendid record was made by Loaderman A. B. Cochran for the Gulf Lumber Company at Fullerton, La. A stiff-boom McGiffert loader was used.

The late Charles King, the well-known lumberman of Quebec, P.Q., left an estate valued at $967,285.05. The estate is to be divided between, the widow, four nieces, other relatives and a number of religious and charitable institutions.

The Forest—The Lumberman's Gold Mine

Specially Contributed by Ellwood Wilson

WHEN the lumberman first began his operations in Canada, he found a vast unbroken stretch of forest which had practically no value at all, which could be had for the asking and which held out little prospect of profit in the working. Just like the first great goldfields, it was too inaccessible to be valuable and he could only take out a few of the nuggets in the shape of the very best and largest white pines, which, after a long journey to market, barely repaid him for his outlay and trouble. Then as the country opened up and timber in othe rsections began to be scarcer the timber began to increase in value until now it is one of our great national assets. The time has come when we can no longer use the pick and the pan but must install hydraulic machines chemical plants and must make the most of our low grade ores. The forest, as a gold mine, will soon be a thing of the past and the lumberman must cease to be a miner and must become an up-to-date farmer, using every help that modern science can give him for the betterment of his holdings and for the production of timber crops. Just as the time is coming when the western farmer can no longer take off a crop of wheat, year in and year out, with no return in the shape of fertilizer, so can the lumberman no longer hope to take timber from the forest continuously with no care for the crop of the future.

The most vital factor in any manufacturing enterprise is the raw material on which it operates and unless there is a sufficient supply at a low enough price, the venture is foredoomed to failure. If a man buys a piece of timber and builds a small mill to saw it up, with the intention of abandoning the enterprise as soon as his wood is all sawed up, he probably proportions the mill to his supply and charges off part of the cost of construction each year, so that, at the end of his operation, the mill has been paid for and can be abandoned. In the majority of cases, however, in the lumber industry and always in the case of a pulp or paper mill, the plant is of permanent construction and is supposed to run for a long term of years, and it is necessary to have a permanent source of supply. In this latter case the elements which govern the cost of raw material are, price to buy limits or stumpage, location and accessibility, amount and quality, transportation and fire risk.

The Cost of Stumpage

Taking the situation in the Province of Quebec as an example, the first of these elements, the cost of limits or freehold timber lands, the price of the former has risen from less than one-half cent per cord in 1860 to 20 cents per cord and the most of this increase has been since 1895, while in the last few years freehold lands have risen from 50 cents or $1.00 per acre to four dollars. This rise in price is likely to be even more rapid in the future than in the past, due in part to increasing lumber consumption, but mostly to the large increase in the number of pulp and paper mills.

With the increasing demand for timber, lands which have hitherto been thought practically inaccessible are being taken up, until now, lands are being held from which it is impossible to remove the timber at a profit, and, although the price of wood is rising, the carrying charges for such lands are also accumulating and the probability is that they will never yield a profit.

While unquestionably the amount and quality of timber on a given tract is a factor of vital importance, buyers have often paid no attention to this but have bought and paid for large tracts of practically worthless timber and burnt over country. This has generally been where such tracts have been included in larger areas, but there is no common sense or business judgment in buying timber lands on the basis of acreage and it has only been because there was sometimes enough timber to pay for the whole investment that such a policy has not brought disaster. As timber lands are being cut over, it is necessary to go farther and farther from the centres of population and from railroads, and this, in Canada, means going farther north and east where the quality and quantity of timber diminishes very rapidly and the difficulty of getting it out is greatly increased by more severe climatic conditions.

As the woodlands become more inaccessible the cost of transportation rises and this is further augmented by the increase in the price of labor and its increasing inefficiency. It is probable that no other way of getting out timber will ever be possible except by river driving, as there will never be timber enough on any given area to pay for building a railroad or roads for motor tractors.

Finally there is the ever-present fire risk as an element in the cost of wood and while this is decreasing rapidly, still, the cost of

guarding against it will increase as the country is more and more opened up to settlement and traversed by railroads.

The Day of Cheap Timber Passed

With these facts before us, let us inquire what can be done to offset them. The lumber and pulp industries in Canada must realize that the day of cheap timber is over. No longer can woodlands be picked up for a song and skinned over at an enormous profit. More efficient methods of lumbering and transportation must be devised and employed. The primitive and wasteful methods must be supplanted by modern and more intelligent processes. Lumbering can no longer be the hand-to-mouth, trust-to-luck business it has been. The time has come when the engineer must take the place of the logging boss and the drive foreman. To come down to brass tacks, the following changes are needed.

First of all, owners and buyers of woodlands must know what they have or are buying, not in square miles, but in cords or board feet, not guessed at by some "explorer" working with an old government sketch map on which it is impossible for him to locate himself by several miles, but ascertained and mapped by trained and careful surveyors and estimators. Lands should be carried on the books of owners as so-and-so many cords, not as so many acres. Lands should be bought and paid for not on a basis of so many square miles, but so many board feet of stumpage.

Knowing how much timber he has and its location, the operator should make detailed plans of how much he will cut and where. In the past, this has been left largely to chance, or the future has been sacrificed to the present by taking out the timber which was the easiest to get at, regardless of any other factor. This has not been due so much, either to ignorance, or carelessness on the part of men in charge of woods operations, as it has to the ignorance of stockholders and directors and their demand for an immediate showing of profits. Timber along the shores of large rivers and easily accessible lakes has been cut off, leaving everywhere sections which were rocky or hard to get at, with the result that now it costs almost more than the timber is worth to clean up these sections. If land had been intelligently cleared up, taking the easily lumbered and more difficult together, the price would have been higher at the time, but would be much lower now and the average cost for a long period would be much less. Lands about to be cut over should be thoroughly cut, every merchantable tree allowed by the government regulations to be cut should be taken, all material which can possibly be utilized should be removed from the woods. Stumps should be taken just as low as it is possible for the sawyers to work. The axe should only be allowed for trimming off branches. Odd length logs should be taken so that the tree may be utilized down to at least four inches in diameter at the top. Trees with rot should be taken where only a small percentage of the volume can be used. No logs should be left in the woods and no good timber should be used for roads or skidways. The felling should be handled so as not to destroy the young growth any more than is absolutely necessary and camps and corduroy should be built of inferior kinds of trees. A better system of brush disposal should be employed to reduce the fire hazard. More intelligent and better trained men should be put in chage of woods opeartions as foremen and inspectors.

Improving the Water Courses

Transportation methods must be improved. The government, acting in conjunction with lumbermen and owners of waterpowers, should at once begin the construction of the necessary dams and works to control and conserve the water in the streams. Operators should make permanent river improvements which, while costing more than the present temporary makeshifts, would materially decrease the cost of driving year by year. One of the big items in driving is the cost of taking men and provisions to the places where the work begins, this has to be done each year before the ice is out and very large sums are spent in "waiting time." This could be obviated by constructing roads along the main drivable streams, a few miles each year, which would not only permit of taking in the river drivers but also the jobbers or choppers and their provisions. With such roads the logging could proceed in the summer with much less waste and difficulty than at present. Fire fighting would also be much facilitated.

Telephone lines should follow all these roads and much time at present lost on the drives saved and the manager kept in close touch with his operations. Early reports of fires telephoned in would save loss by enabling men to get to the danger point quickly.

This would also enable the drive to be planned and carried out much better. At present, the drive is let go with the breaking up of the ice and the logs travel down the stream haphazard, getting jammed or scattered over low-lying lands from which they must later be removed at large expense. It has always seemed to the writer that if crews were placed at the difficult places, flats, rapids, eddies, etc., whose business it would be to keep the logs from jamming and keep them moving so as to get the full use from the high water, the saving in the cost of cleaning up by the rear would be well worth while.

Often in bad rapids on streams which are driven every year, it would be a comparatively inexpensive matter to blast out a channel which would keep the logs from jamming. Permanent stream improvements which could be constructed co-operatively by all the operators driving on a river would reduce drive costs for all time to come. As it becomes better understood that we cannot cut off all the timber in a given territory and then leave that section for another, more attention will be paid to this matter.

All those who use wood for the raw material of their business must learn that the time required to grow trees is the governing factor and instead of operating from hand-to-mouth and taking it for granted that woods operations can be carried on in the old primitive way and without skilled supervision, they must institute the same skilled management that they use in their manufacturing operations, introduce improved machinery and efficiency systems, make permanent improvements to their drivable streams, build permanent roads and plan their operations thirty years ahead instead of from year to year.

New Equipment for South Nelson Plant

The saw milling plant of Messrs. Geo. Burchill & Sons at South Nelson, N.B., Miramichi, underwent extensive improvements during the past season. The mill was originally equipped with a live gang which consisted of a sash containing 8-10 perpendicular saws 9-10 gauge spaced to cut deals or boards as required. This was the style of mill which was generally adopted in New Brunswick when the lumber manufacturing industry was first begun, as it was the most suitable for the demands of the British market. Even up to the present time there are four gang mills running on the Miramichi. This type of mill was especially adapted for sawing large sized logs into 3-inch stock, on account of its cheap cost of manufacture and perhaps more especially on account of its uniformly even manufacture—a feature for which gang cut deals are noted. A gang, however can only be used to advantage in large logs and, as the logs get smaller year by year, the economic results of the gang likewise diminish until we reach that point where the savings of other forms of manufacture will figure out in favor of the more modern mill.

These were practically the reasons which prompted the firm of Geo. Burchill & Sons, after last season's operations, to take down the gang and install a band. They realized, that, in order to cope with present day conditions in the lumber business, every single foot of wood must be utilized and the waste in saw kerf, etc., reduced to a minimum. Accordingly, they made preparations to remodel the entire mill and, as a result the plant now consists of an 8 ft. single cutting band mill. The band was supplied by the Waterous Engine Works, of Brantford, Ont., and the rest of the machinery, drives, transfers, etc., came from the St. John Iron Works, St. John, N.B.

While there has not been an opportunity, as yet, to secure actual figures by which a comparison could be made between the results of the band and the gang, it is evident already that, in some logs the band is getting a better turn out of the log scale than the gang ever did, and, at the same time, it is possible to make a better classification of the lumber. The band shows up perhaps to its best advantage in the manufacture of hemlock boards where the saw kerf is quite a factor, while the sawing of dimension stock, for which we have quite a number of orders, is now made quite simple—hitherto it was impossible.

Geo. Burchill & Sons Plant at South Nelson, N. B.

Work of the Dominion Forestry Branch

Fire Protection Organization Being Improved and Extended—Uses of Woods to be Studied—Practical Methods Bringing Good Results

The Forestry work of the Department of the Interior of the Dominion government was the first effort in Canada to put forest administration on a permanent and scientific basis and the work, so well inaugurated by previous ministers, has found a hearty support in the present Minister of the Interior, Hon. W. J. Roche. Under his administration the fire patrol staff has been largely increased and is better equipped, the enforcement of regulations to decrease the fire hazard along railways has been made effective, the area of forest reserves has been largely increased and the staff, technical and non-technical, has been added to as necessary to meet this increase in area, while a large amount of improvement work, such as roads, trails, telephone lines and lookout stations, has been carried out and will greatly improve the facilities for protection of the forests.

Hon W. J Roche

The protection of the immense area of forest and woodland in the northern part of the province of Manitoba, Saskatchewan and Alberta and in the Railway Belt in the province of British Columbia is an enormous task and is complicated by the building of railways, the advance of settlement and the clearing of lands with fire as the chief agency. On the vast tract of 200,000 square miles outside of forest reserves there are 190 fire rangers patrolling in 13 districts, each of which is under a chief fire ranger who supervises the work of the staff of rangers in his district. The equipment for patrol has been improved by furnishing eight power boats and thirty-one canoes or row boats for patrol work and by furnishing each ranger with canvas water buckets and other portable equipment necessary for fighting fire. The enforcement of the regulations along railways has brought about the better clearing of the right-of-way, closer inspection of the equipment of locomotives, and the establishment of patrols by the railway companies, which has greatly reduced the fire danger along the railway lines. During the year 1913 the fire loss was remarkably low and while this was in part due to weather conditions it was, as stated by the Chief Inspector of Fire Ranging, also due to the distinct improvements in organization and administration which have been brought into effect. This is demonstrated by the fact that 700 fires were extinguished by the fire rangers during the year.

This great area of forest and woodland outside of forest reserves is being inspected and mapped each year by timber survey parties under technically trained foresters and in a few years accurate knowledge of the timber resources of this country will be obtained and it will be determined also what lands are non-agricultural and should be retained for timber production.

The Work of the Field Survey Force

In the summer of 1913 the Dominion Forestry Branch had eleven survey parties in the field, and over 15,203 square miles of wooded country were examined, at an average cost of only eighty-nine cents a square mile. The technical foresters in charge of these parties are qualified to report not only on the forest conditions but also on the geology and character of the soil in the regions examined, and if the latter is clearly unsuited for agriculture the area is recommended to be reserved in order that the young trees may be better protected from fire, which in the last fifty years has destroyed over half the original stand of timber on the area examined by the Branch. This area comprises about twenty-five per cent of a belt from 40 to 150 miles wide, stretching from Lake Winnipeg to the British Columbia boundary. In the Railway Belt practically all of the Coast district and the Dry Belt has also been examined by Dominion foresters.

It is disheartening and is an index of the gravity of the situation in regard to the timber supply to find such reports coming in from these explorations as that on 8,000 square miles of absolute forest land on the north end of the Rocky Mountains there is not eight per cent of virgin timber. This is the result of repeated fires and involves a loss of over one hundred million dollars to the country. Only the most strenuous efforts of a complete and well equipped staff can arrest this fearful destruction.

Adding to the Forest Reserves

As a result of the reports of these exploratory parties additions were made, in the year 1913 and in the present year, of 18,673 square miles to the forest reserves. These include all the non-agricultural land in the dry portion of the Railway Belt in the Province of British Columbia, in the Rocky Mountains as far north as the Athabasca River, and in the province of Saskatchewan. This includes nearly all timber lands, or poor lands in the vicinity of settlement. The area in forest reserves is now 43,715 square miles. As stated by the Director of Forestry, "Perhaps the most outstanding feature of the development of Dominion forestry work recently has been the consolidation of the forest reserve administration on a well organized basis, and with a fair proportion of scientifically trained foresters, with the result that it will be increasingly possible to apply good forestry methods in the handling of the timber and other resources of the reserves. This is a development made possible by the fact that technical training in forestry is now being provided by some of the colleges in Canada, and when this is supplemented by ranger schools, in which the forest rangers can also be given special instruction, it should not be long before the Dominion Forest Service will be as well organized an institution as in any other country which has reached the same stage of development."

The staff on the reserves has increased to 110, of whom 20 are technically trained foresters. In the last two years a great deal of improvement work has been done on the reserves, amounting to 22 ranger houses and 42 cabins, 395 miles of road, 1,150 miles of trail, 200 miles of telephone line and 5 lookout stations. Complete specifications have been drawn up for these classes of works and a careful system of cost keeping in eliminating any unnecessarily high costs.

The result of these improvements is shown in the fact that the loss by fire on the forest reserves in the year 1913 was less than two-hundredths of one per cent.

Reforestation Progress

While protection work on the forest reserves has been given first consideration, management of operations and reforestation work have not been overlooked.

Small nurseries have been developed on some of the reserves to provide trees for reforestation. The nursery on the Spruce Woods Forest Reserve in the province of Manitoba now contains 530,000 seedlings and transplants and the work of replanting on this reserve will be begun seriously immediately. A number of the new reserves in the province of Saskatchewan are bare, sandy tracts which will require replanting and steps will be taken immediately to get this work under way.

In management of operations the chief advance has been in the disposal of debris. Both on settlers' permits and on larger operations, the piling or lopping of brush has been required and is now being fairly well observed, resulting in a great reduction of the fire danger and in providing a better seed bed for natural regeneration of the forest.

The first and one of the most interesting divisions of the forestry work of the Dominion was providing trees for planting on farms in the prairie districts in the West. Its value in adding to the comfort and beauty of the prairie homes is incalculable and the appreciation of this work is very gratifying. It is now being imitated by the federal government of the United States, but in this respect Canada led the way.

Approximately three million trees were distributed in 1913 by the Dominion Forestry nursery station at Indian Head, making a total of twenty-four million trees furnished by the nursery station to settlers on the western prairies. The trees chiefly planted are green ash, Manitoba maple, cottonwood, willow and Russian poplar; and of the conifers, spruce, larch and pine. In 1901 only four acres were devoted to tree culture at Indian Head. Sixty-seven acres are now required, and there has been such an increase in the demands for trees that a branch nursery was established in 1913 at Saskatoon, which will take a share in the distribution of tree seedlings this spring.

The New Forest Products Laboratories

One of the most important advances in the past year is the establishment by the Department of the Forest Products Laboratories at Montreal in co-operation with McGill University. These laboratories have been established to furnish authoritative and reliable information in regard to Canadian woods, and to induce the carrying on, into the manufacturing processes, of the elimination of waste which is being introduced into the standing forest.

Waste is being reduced in the forest itself, but the problem goes further. Waste should be reduced in the use of forest products. This

is the object of the laboratories which are to lead to a better utilization of our forest resources by:

1. Finding more efficient methods of manufacture of woods.
2. The elimination or utilization of the wastes of manufacturing and logging.
3. Finding uses for woods not now commercially useful, from a study of their mechanical and physical properties.
4. Finding better use for woods now used to make the lower-grade commodities.
5. Looking for Canadian woods to substitute for imported woods, either in their natural state or after treatment.
6. Studying and developing the fundamental principles underlying the treatment of wood in its use in the manufacture of fibre products—alcohol, turpentine, resin, tar, etc.
7. Serving as a public bureau of information on the properties and utilization of forest products.
8. Co-operating with consumers of forest products in improving present methods of use and formulating specifications and grading rules for commercial woods, materials secured from them, such as gums, oils, resin, etc., and materials used in the treatment of wood-creosote, zinc chloride and other preservatives.

It is proposed to begin at once by making the tests of the mechanical properties and strength of the different varieties of woods. Western Douglas fir and a few eastern species will be the first experimented upon. Also there will be undertaken immediately, investigations in the use of woods in the manufacture of pulp and paper. The special problems that this section will deal with at present are:—(1) methods of making ground-wood pulp to determine whether or not commercial pulp can be made from species other than spruce; (2) the practicability of treating different woods with the sulphite and soda process; (3) the qualities of paper which can be made from different grades of the various sulphite, soda and ground-wood fibres; and (4) the practicability of using different forms of wood waste for the manufacture of paper pulp and other fibre products. The manufacture of wood-pulp and paper is to be one of the largest industries in Canada and the problems that affect them are of vital interest to the country.

Work to be Self-Supporting

The tendency is for government forestry to become more and more self-supporting as time progresses. It has long been so in British India, where forestry practice is highly developed; it is rapidly becoming so in the United States in spite of an annual expenditure of over five million dollars for forestry purposes. It will soon be so in Canada in spite of the fact that the revenue from Dominion Forest Reserves for the fiscal year ending March 31, 1913, barely exceeded $23,000, derived principally from the disposal of small amounts of timber to settlers and miners.

The present revenue from Dominion timber lands under license approximates one-half million dollars, but although a considerable portion of these timber limits are within forest reserves, the revenue is at present handled by another branch of the Department of the Interior.

Since the passage in 1913 of the new forest reserve regulations permitting the grazing of stock to the full capacity of these reserves, a very important new source of revenue has been provided. The revenue from grazing on the National Forests of the United States last year amounted to over one million dollars. On Dominion Forest Reserves four million cattle, at the minimum charge of twenty-five cents a head, would produce a similar annual revenue, and the forest reserves should ultimately provide ranges for that number.

Other natural resources are exhaustible; the forests can be rendered permanently productive. Other resources are valuable for themselves alone; on the maintenance of the forests depends the perpetuation of Canadian game and also all industries relying for their existence on a continuous water supply which the forests alone can regulate adequately.

It should be remembered, however, that forest fires still rage and the danger continues in spite of an efficient forest service. This is brought home to us by the smoke covered cities in the month of May. More money should be spent at once and should continue to be spent in perfecting forest fire administration. Results have shown that this is the cheapest form of insurance possible.

A Remarkable Record of Service

One of the most important factors in the successful operation of a sawmill, is the securing and holding of skilled men. At Victoria Harbor, Ont., the Victoria Harbor Lumber Company have been able to retain the services of some of their best men for many years. The accompanying group portrait shows Mr. Philip Schissler, who has been with the company for 30 years, as yard manager, and his five

Lifelong employees of the Victoria Harbor Lumber Company—Philip Schissler and his sons,

sons, who have never worked for anyone else until two years ago when one of them accepted a position as customs officer. The father is the central figure in front. From left to right the members of the group are as follows:—Front row: Harry, inspector; Philip, yard manager; Herbert J., head inspector; back row: Frank, office clerk;

Extensive plant of the Victoria Harbor Lumber Company, Victoria Harbor, Ont., as seen from the water front.

Charles, assistant inspector; Jesse, former inspector, now customs officer at Port McNicoll.

Philip Schissler is of Pennsylvania, Dutch origin. He came to Canada from Williamsport, Pa., to work for the Georgian Bay Lumber Company, at Waubaushine, Ont., and remained with them about 12 years. When the late John Waldie started the Victoria Harbor business, Mr. Schissler was appointed yard manager, and he has stayed at this work ever since, a fact which accounts considerably for the uniformity of the inspection of the company's stock. Another son, the eldest, who also was with the company during all his working life, was unfortunately killed by an accident some years ago. A memorial window to him has been erected in the Presbyterian Church at Victoria Harbor.

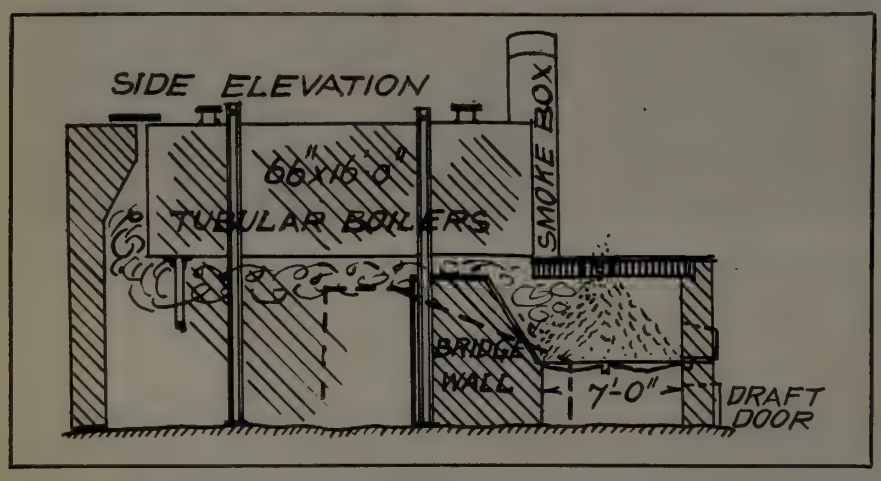
The plant of the Victoria Harbor Lumber Company is one of the most up-to-date and efficient saw milling plants in Eastern Canada. A panoramic view of the harbor showing all the buildings and yards of the plant is given in another illustration. The company was organized in 1886 by the late John Waldie. The plant consists chiefly of three mills, a power house and a splendid piling yard. Mill No. 1 is a timber mill and planing mill combined, with a capacity of from 40,000 to 45,000 feet in a ten-hour day. Mill No. 2 contains a double cutting band, one circular, one gang and a lath mill. Mill No. 3 contains two single cutting bands, one gang, one slab resaw, and a lath mill. Mills No. 2 and No. 3 each produce about 125,000 feet in a ten-hour day.

The company's piling yards are laid out so as to furnish the best possible facilities, and the stock is shipped from the pile direct into railway cars, tracks being laid between the piles. The company use two of their own locomotives in drawing the cars to and from the yards.

Installing Sawdust Burning Boilers

By W. Marsh

BEFORE the introduction of steam as a motive power for operating sawmills, it was a simple matter to rid the mill of sawdust. The only thing to do was to allow it to fall into the waterway under the mill and be carried away into the main stream. This went on without interruption for many years, but the time came when navigation and fishing rights were seriously interfered with on account of the accumulation in the rivers of beds of sawdust. This, and other causes, led to the installation of steam



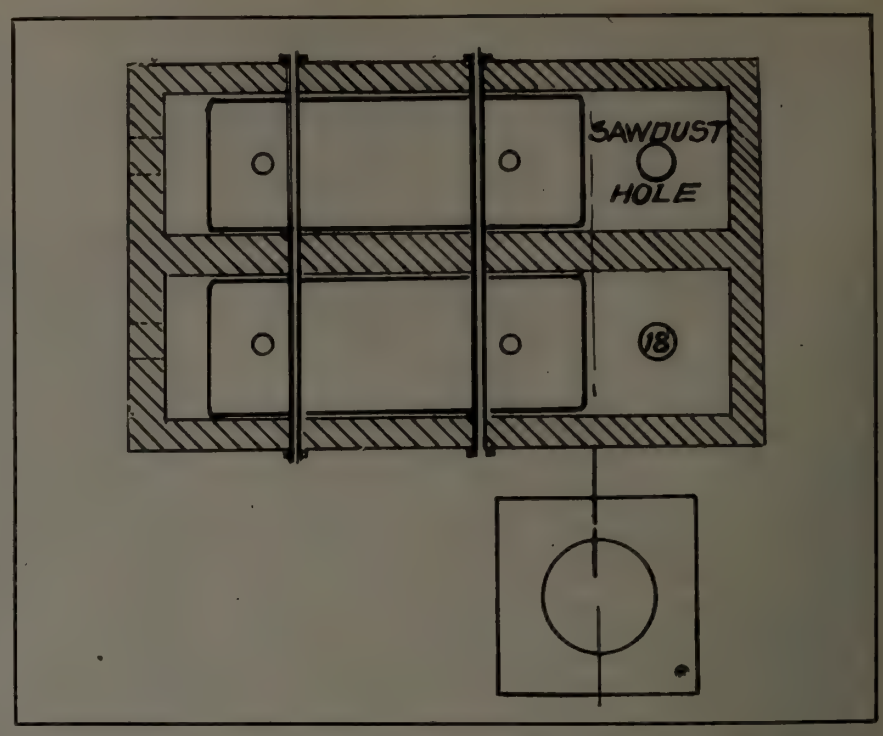
power, and today it is a rare thing to find a waterpower sawmill, except on the very large rivers such as the Ottawa and tributaries.

Naturally, the men to whose lot fell the first installations of boilers for using sawdust, were handicapped on account of inexperience. They had a hard task, and it was heartbreaking to see the mill having to stop for want of steam. Criticism, naturally, was not lacking (fortunately, sawmill engineers did not swear in those days), and many opinions were expressed.

Up to a few years ago it was customary to build very long boilers, about 30 ft., with two or three large flues about 12 to 15 inches in diameter, with the furnace built immediately under the boiler, or boilers, as the capacity required called for. Chutes were provided to allow the sawdust, carried in the conveyors, to fall into the furnace, at the side of the boiler. Cuttings were also hauled by horses from the mill to the front of the boiler furnace, and fed in by the fireman, and, in large mills, by several firemen.

Engineers in the meantime worked hard towards improvement, and today we have a furnace for burning sawdust and mill refuse that gives the maximum of efficiency and requires a minimum of labor to operate. This furnace is generally known under the name of "Dutch oven." The illustration shows the plan of two boilers set up with the Dutch oven extension for burning sawdust.

One feature of this furnace is the bridge wall, it will be noticed that it is built up to within about 8 inches of the bottom of the boiler, and 20 inches from the front. This causes a sharp current of air to



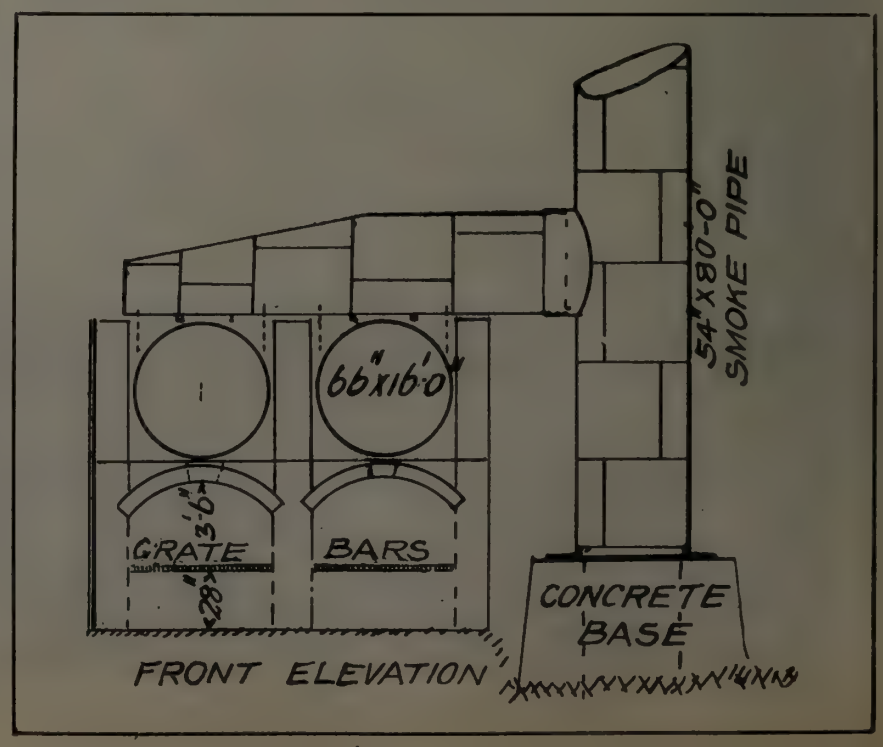
carry the flame the full length of the boiler. The dotted lines in No. 2 show another manner of building the bridge wall, but this is not a good design for easy steaming, for the flame strikes the fire sheet of the boiler too far back and a consequent loss of heat is the result. The principal feature of the boiler setting shown in the plan is the smoke pipe. D is 54 in. diameter by 80 ft. long; for two boilers 66 in. x 16 ft. This might appear excessive, but for burning green fuel it has been proved to be just what is wanted. There is then no need of introducing steam jets or patent blowers to help the draft.

For burning green fuel in a sawmill, the area of the smoke pipe or chimney should exceed the combined area of the boiler tubes, at least fifty per cent., and be four and a half times the length of the boiler in height.

A few years ago a man arrived in the province of Quebec with some capital to build a sawmill. He asked some advice of a friend who had been in the business for many years. The friend told him if he was going to build a sawmill "not to build it," but, if he insisted on building, to purchase a couple of extra acres of ground next the mill and cover it with boilers. Whether this man took his friend's advice is not on record, but he is in the sawmill business today and the incident occurred twenty years ago, which goes to show that he must have taken at least half his friend's advice, if not the whole.

There is one peculiar fact regarding the burning of sawdust for steaming. It must be burned alone. No other refuse should be mixed in with it. It is better to burn other cuttings in a separate furnace. This is particularly so in small plants.

Just one more word; to the second hand buyer—Never buy a second hand boiler; unless you can prove by the stamp on it that it has been in use only a short time and is of first class design. Then have the boiler inspector see it before you have anything to do with it.



Reducing Waste in Logging Operations

A Practical Consideration of a Problem Which Faces Every Timber Owner—How the Output per Acre Can Be Increased Without Additional Expense

Contributed specially by D. E. Lauderburn

WHEN the subject of waste is brought to the attention of an operator who owns his timberland and is running a saw mill, his first thoughts seem to be invariably about the waste in the mill, the complete utilization of everything that can be manufactured at a profit and the utilization of as much of the waste material as possible for fuel. His judgment of the waste in the woods is based on the cost of the logs at the mill. The inspection of the mill operations is easy, the inspection of the woods operation is difficult, involving much walking where the mosquitoes and black flies are numerous and persistent. And why inspect the woods operations thoroughly, he asks, when the logs are coming in at a reasonable cost? The woods superintendent is apparently energetic and competent. He generally has worked his way up from the ranks, and probably holds his position mainly because of his ability as a leader of men.

But let us spend a few days "up river" where these logs come from; not all the time on the logging roads and "lunching" in the various camps, but travelling through the brush between the logging roads, and let us occasionally go back to the very last yard and up a skidding road to where the last tree was cut, and we shall find many surprising things which may take some of the complacency out of us, and make us think a bit. I shall summarize a few things I have seen in various logging operations, any or all of which may occur in yours.

The Chief Sources of Waste

Some of the first things we shall see as we enter the cut-over areas, will be the stumps and tops. Here is one of the most evident items of waste in the average logging operations. We are amazed to find very high stumps that are perfectly sound, containing in the aggregate a very large amount of the best grade lumber in the tree. A little more difficult to find are the tops, as they are covered with piled-up brush; but if we dig some out we shall find some more startling things. In an operation conducted by one of the best companies with most efficient mills, I found by actual measurement that the production per acre could be increased 4 per cent if the stumps were cut a little lower, and the top logs were carried up a little higher. In the average tree, the used length could have been increased by two feet without adding anything to the cost of production. The waste of two feet per tree in used length, or 4 per cent in volume, merely indicates that the operator must have more land to cut over, or that he will have to purchase more timber at an earlier date than would be necessary if this 4 per cent were saved. The labor in getting this 4 per cent is not appreciably greater. It merely requires the bending of the sawyers backs to cut the stumps a few inches lower. It does not even require more head-work on the part of the sawyer. It is merely a matter of supervision and encouragement, and the enforcement of cutting rules which may be easily established. If the operation is for pulpwood in addition to saw logs, the waste is often much larger, as smaller material may be profitably utilized.

With the idea of waste in our minds, we find many other things of interest if we have sufficient energy to travel through the brush for several days. Here and there we shall find a tree lodged and left, because it was too much trouble to get it down. Sometimes this is excusable. For example, in a pulpwood operation, a small spruce tree may lodge in a large birch or maple which would be very difficult to fell and cutting it might involve more labor than the spruce is worth; but more frequently, lodged trees are left because the sawyers are trying to make a big day and beat out the other crews. There are always plenty more trees standing about which can be cut easily and the sawyers prefer to make a big day and get a big count which will make their work compare favorably with that of the other crews, rather than do a clean job, cutting everything which is usable. They cannot be blamed for it. Their efforts are most likely judged by the records on paper in the office, not by an active inspection of the area cut over. It is not likely that carefulness in cutting will be carried to such an extreme that the cost of the logs will be greater; but if the proper pressure and encouragement are used, much of the timber now wasted, will be saved and the cost will be about the same.

Another considerable item of waste, caused by misplaced pressure, occurs in the swamping of logging roads, particularly wide main logging roads. The work of the swamping crew is judged by the amount of road cut per day, and the cost per mile. Little or no consideration is given to the amount of timber wasted. The larger trees in the road are usually left for the cutting crew; but invariably many small trees which might profitably be used for pulp wood or lumber are cut down, cut up into unmerchantable lengths and rolled to the side of the road to rot. These logs could just as well be cut into merchantable lengths, and rolled to one side to be picked up by the skidding teams, and at no increased expense. This waste, as with most of the other items, might be prevented by proper encouragement and education with regard to the value of timber.

Value of Timber not Properly Appreciated

Many other items of waste occur which are due to lack of appreciation of the value of the timber. Many trees are cut down and cut up with the axe when the saw might be used to save the amount wasted in chips. Valuable logs are frequently put into corduroy roads and bridges, when less valuable material could be used. Almost invariably the best and largest logs are used in building camps. If the stumpage value of the logs used in camps is not considered, camps can usually be built more cheaply by using large, sound straight logs in the old-fashioned way, but the story may be quite different if the stumpage value is added to the cost of the camps. It is possible to use small, short and crooked trees for camp construction. If the logs are stood upright instead of horizontal. This style of camp has its disadvantages. The chinking is more likely to fall out; but that may not be a disadvantage if the value of the labor necessary for re-chinking is weighed against the value of the good logs used in the old-fashioned camp. These remarks of course refer to camps far from a railroad or sawmill. The cheapest camp can be made of lumber if the cost of transporting the lumber is not too great. One advantage of a camp with logs upright is that it requires less skilful labor in its construction than the old style camp. A few years ago I saw a camp under construction in the state of Maine. Only two men in the crew knew how to notch the logs properly. They were the foreman and the cook, the remainder of the crew being largely foreigners hired in a large city.

Perhaps the greatest waste of all, however, occurs in the poorly planned operation. Frequently a township or limit is cut over in a most haphazard fashion. There may be no "kick" from headquarters for the logs are delivered cheaply enough. Groups of trees are often left standing between the works of different camps, or in the operation of one year the cut is not made adjoining the cut of last year and strips or bunches of timber are left standing in such a way that it will not pay to go in for them another time. Thus, millions of feet in the aggregate are left scattertd about over a township or berth, which are allowed to become hyper-mature and to rot and become a total loss to the owner of the timber. This is particularly true of operations where the cutting is done by contract. Contracts are loosely drawn, giving the jobber the opportunity of cutting wherever he pleases over a certain area. Not being financially concerned with the future of the tract, he cuts where the timber is thickest, leaving scattering trees and isolated clumps, which it would be slightly more expensive to cut. This can be prevented only by rigid contracts compelling the operator to cut clean as he goes. The usual objection to more rigid contracts is that the jobbers will demand a higher price per thousand if restrictions are placed on him. That fact is worth consideration and should be weighed against the value of stumpage which may be saved by restrictions and provisions in the contract, but which is sure to be wasted if these restrictions are left out. With the increasing value in stumpage, the time will come when haphazard cutting will be quite evidently unprofitable. It is unprofitable now, but this is not evident to the officers of a lumber company who have to remain in their offices in the city most of the time, and have not time to examine their logging operations frequently and thoroughly.

The Remedy—Instruction of the Men

There is a remedy for this wastefulness. This remedy is, fundamentally, the instruction of the men in the logging operations with regard to the value of stumpage. I have seen this brought about by the establishment of cutting rules and constant and careful inspection of the logging operations. The waste is usually so evident that it is not difficult to show the superintendent, camp foreman, woods crews, etc., when it exists. If a high sound stump is pointed out, the lumber jack will quickly enough agree that it is avoidabel waste. If his attention is called to the fact that stumpage is worth more now than it was ten, fifteen or twenty years ago, he will understand. But if the superintendent, who may be thoroughly efficient in managing men

and in adopting the best methods of getting out logs cheaply, is indifferent to the increased value of the stumpage and the very evident waste of valuable material, his camp foreman and jobbers are not going to work a little bit harder to save where there is no encouragement, but rather disparagement towards any attempts to do things differently from the methods which they learned when they first went into the woods; and likewise the men in the camps are not going to bend their backs a little more and think a little harder when they are not encouraged to save.

I have seen the waste reduced 10 or 15 per cent and the cut per acre increased that amount without the disastrous results that are sometimes predicted by the "stand-patters" among the lumbermen. The men did not quit when they were compelled to bend their backs and saw the trees down close to the ground, and when they were compelled to go back to fell a lodged tree, or some scattered trees left standing, or to pick up some logs left beside the wood. Instead, they took pride in doing clean work. Camp No. 1 would pride itself on doing better than camp No. 2, and the company continued to cut and manufacture at a profit.

The method used in eliminating the waste was simple in the instance referred to above, and is applied in modified form in many operations. A set of cutting rules was drafted in several languages, and posted in the logging camps. A corps of inspectors was organized. These men did nothing but travel from camp to camp, examine the operations carefully, measure the amount of waste and report to the head office of the company. The manager thus had figures from each of his operations, and could compare the work of his superintendents or jobbers. If matters were not satisfactory the blame would fall on the superintendent or jobber for allowing his men to waste the company's timber. Matters would have to be changed as the reports would keep coming in week after week, and improvement or lack of improvement could be noted. The superintendent or jobber would have to take his camp foreman or sub-jobbers to task, and the foreman or jobber was compelled to force his woodsmen to cut according to regulation. The inspectors were the eyes of the manager in his city office miles away, who usually could not get away to the woods and use his own eyes. All orders to the men in the woods would come from headquarters, and they were the kind of orders which brought results. At a cost of a few thousand dollars a year, many thousands of dollars worth of timber was saved. The time is coming when all lumbermen will become equally conservative in the cutting of their timber and more attentive to methods requiring careful supervision of the harvesting of an increasingly valuable natural resource.

The Railroad Car as a Lumber Consumer

Some Car Shop Views Arisng Out of the Increasing Use of Steel Frames and Wood Lining—A Few Valuable Suggestions

(From a Montreal Correspondent)

ACCORDING to the belief of those who are engaged in the business of building railway cars, the all-wood box car is doomed, and, before long, Canadian railways will have adopted composite construction, with steel frame and wood lining for freight cars. This change in construction has made a great difference in the lumber situation, both for car builders and lumbermen. It has opened up a market for a specialized lumber product which takes the place of a lot of miscellaneous items formerly used, and this product applies principally to owners of Norway pine limits.

I would like to point out to the Eastern Canadian lumbermen some features of this market and the extent of it. In the all-wood car the builders were limited to the use of long leaf pine for the sills, and long leaf or British Columbia fir for ridge poles and carlines. In addition to these larger sizes, there were a lot of smaller sizes used for framing, etc., and although oak and sometimes birch were allowed for the smaller members, the lumber buyers could usually make a better trade on the large sizes of yellow pine if they included a proportion of the smaller ones with their orders. Consequently yellow pine held practical control of the market.

The parts of the newer composite car in which the specifications call for yellow pine, are limited to two or three items of small size, and in each case the builders usually have the option of using yellow pine, British Columbia fir or Norway pine. The western mill owners are seriously handicapped by reason of the long haul on their product, and, in the past supplies of Norway have been totally inadequate, so that the shops have been driven to the use of yellow pine.

There are two special sizes which comprise the bulk of the lumber requirements for inside sheathed, steel frame, box cars. In each car there is approximately 1,000 feet of 1¾ x 6 in. x 15 ft. 7 in. and 400 feet of 2 x 6 in. x 8 ft.7in. It may be interesting to learn that since 1908 the Canadian railroads have put into commission close to 40,000 of these steel frame cars, but these were not all built in Canada.

It is difficult to get exact figures, but at least 25,000 of them were built at home. As each car requires approximately 1,000 feet of 1¾ x 6 in. x 15 ft. 7 in., this means twenty-five million feet of side lining, and in addition there is in each car about 400 feet of end lining of 2 x 6 in. x 8 ft. 7 in. requiring another ten million feet, in all about thirty-five million feet for the twenty-five thousand cars.

There is no way of arriving accurately at the quantities of the different kinds of lumber which went into this construction, but twenty per cent. will more than cover the quantity of fir and Norway, leaving close to thirty millions of yellow pine used for inside sheathing. If this were absolutely new business the showing would not be so bad, but this yellow pine has displaced spruce and white pine formerly used on all-wood cars for inside lining (which was furnished in miscellaneous sizes), and British Columbia fir, which was used largely for outside sheathing, so that, with the exception of the flooring and roofing, yellow pine has practically displaced all Canadian products.

I think it is safe to assume that Canadian lumbermen have not grasped the magnitude of this situation. This is all high grade stock commanding a good price, which goes to the Southern States mills, along with a large proportion of the freight to American railroads. This material comes through in foreign equipment, displacing that of our own roads, which would be used if the material were manufactured in Canada.

In addition to the inside lining there is the decking, which is usually spruce or Norway. The building of this lot of cars consumed about 800 ft. per car of this item, or in all twenty million feet. The car shops have difficulty also in getting domestic supplies of this item, cut to suit their requirements. This stock is all, or practically all, 9 ft. long, and 2 x 5 to 8 in., with no limit set to the quantity of any particular width, such as is required for 2 in. lumber cut for the American market for the building trade; a trade which insists on a specification being adhered to, and in addition usually demands a long average length.

The case for the car builder is this: He would favor home supplies but cannot get them to suit his needs. A southern mill will cut any size in almost any quantity and deliver promptly, and they are looking for business. We realize, of course, that, as a rule, his is an all-the-year-round logging proposition, whilst the Canadian's is not. Yet one need only go to any large yard to find immense stocks being cut on pure speculation, as to the demand at least, which means more or less speculation in sizes. One, two and three inch lumber, ten feet and up, has been cut by every mill since lumbering started, and often the stocks are piled to wait for a buyer. Why not switch over part of the Norway into what the car trade asks for? The probability would be that any lining cut and stocked would not remain in mill yards longer than many other lines now carried.

This car lining proposition is as much a fixture as many lines now being manufactured from Norway pine. As already stated, it is a high grade article, and should include all the upper end of the log product but will admit of small tight red knots up to 1-in. in diameter and well scattered. The edges should be practically clear of knots that will loosen up in the kilns, and split out in the matching. The object to be attained is a perfectly tight car with a single wood lining, free from defects which, in the course of time, and through service, might get worse and the car thus lose its "grain tight" condition. I think that our mill men can devise some way of securing part of this trade. It seems to be worth going after.

The same conditions prevail in regard to car decking. Mills will not cut 2-in. planks 9 or 18 feet long, especially for car trade. The enormous waste and loss to the car companies caused by buying 2-in. planks 9 to 13 feet, is driving them to the yellow pine markets for this item.

The foregoing covers only a few freight car sizes and amounts to fifty odd millions, over half of which has been foreign lumber, the money for which went out of the country. These conditions in reference to decking prevail also in the flat and ballast car trade, of which no attempt is made to form an estimate, but it is also a big item.

I am not offering any solution, simply pointing out a great big field for somebody to invade. It looks worth while and is worked by the American lumbermen for all it is worth, against a freight rate of from $12 to $18 per M. feet. Why not by the Canadian?

Selecting Belts, Pulleys and Shafting

Useful Information Regarding Economical Combinations for the Transmission of Power—Principles Which Govern in Different Cases

Specially contributed by N. G. Near

BELTS are usually expensive. The wider, the thicker, and the heavier the belt, the more it costs. The cost can therefore be considered as directly proportionate to the weight. The problem of belt choice thus resolves itself into the question, "Shall I buy a light belt and run it at high speed, or shall I buy a heavy belt and run it at low speed?" The light belt will cost less; the heavy belt more.

For example, I know of a belt in a sawmill, an unusually thick and heavy one, that weighs over 2,500 pounds. It is 114 feet long and 8 feet wide. Of course, it cost considerable. In its day it was a record-breaking belt, but, it cost too much. It is needlessly large, a fact that can be easily proved by a little simple arithmetic. This belt runs at a very low speed—about 1,500 feet per minute. Now, 3,000 feet per minute is not too fast for any belt. 4,000 and even 5,000 feet per annum are often successfully used. oHewver, in the above case the speed could be doubled as well as not, which would require a belt weighing only half as much. The belt could be split in half. Pulleys of larger diameter would be required, true enough, but the increased diametrical size would be considerably offset by the reduced width, resulting in pulleys that would weigh and cost but little more. The total cost, then, with pulleys of doubled diameter and belt of half the width, would represent a good substantial saving.

By applying your elementary arithmetic along the above plan you can, with absolute certainty, select the most economical belt and pulley combination. To be more concise, I will tell exactly how to make

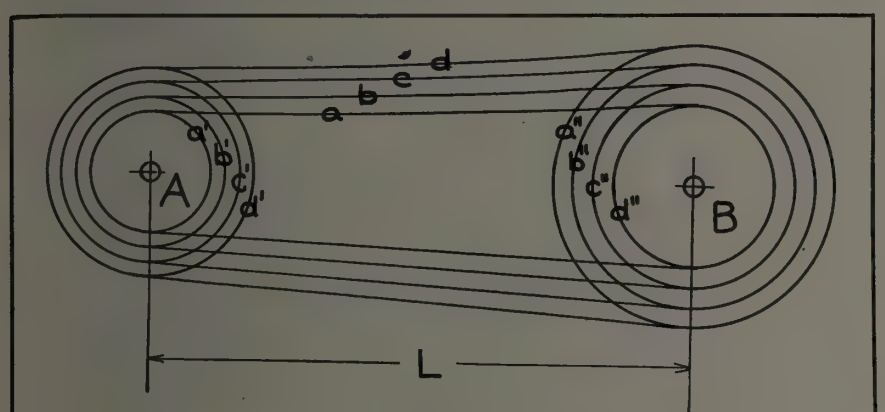


Fig. 1.

Cost of a + a′ + a″ = ? Cost of c + c′ + c″ = ?
Cost of b + b′ + b″ = ? Cost of d + d′ + d″ = ?

Select the least expensive combination provided the pulleys are not too small. Be partial to large pulleys.

the selection: To begin, we use the well-known rule of thumb, "A belt one inch wide, running at the rate of 800 feet per minute, will transmit one horsepower. A double ply belt, one inch wide, running at the rate of 500 feet per minute, will transmit one horsepower."

In Fig. 1 I show graphically how it is determined. A is the driving shaft which runs at 400 r.p.m. B is the driven shaft, and it must run at 300 r.p.m. The pulley ratio must therefore be 4 to 3. That is, A must be just ¾ the size of B. Hence, if A is 12, 15, 18, 21, 24 or 27 inches in diameter, B must be 16, 20, 24, 28, 32 and 36 inches in diameter. Twenty horse power will be transmitted from pulley A to B. Allowing a belt speed of 3,000 feet per min., we find the belt width necessary by applying the above rule of thumb, with a double thickness belt we find that each inch in width will transmit 3,000 ÷ 500 = 6 horse power. The width of belt to transmit 20 h.p. will therefore have to be 20 ÷ 6 = 3 2/3 in. Inasmuch as this is an odd width we will try a 4-inch belt, temporarily.

The pulley diameter on shaft A, to drive the belt 3,000 ft. per min. is easily found by multiplying 3.82 by 3,000 and then dividing the product by the r.p.m.—400. This gives a pulley diameter of 28.6 in. Expressed algebraically the formula is $D = \frac{3.82 \times S}{N}$,

where D = diameter of pulley in inches;
S = speed of belt in feet per minute;
N = r.p.m. of shaft.

However, pulleys are not made 28.6 in. in diameter, nor are they made in 29 inch sizes, according to the pulley catalogs I use. They are made in 30 in. sizes, so, we will try A = 30 in.; and B = 40 in., the correct pulley ratio.

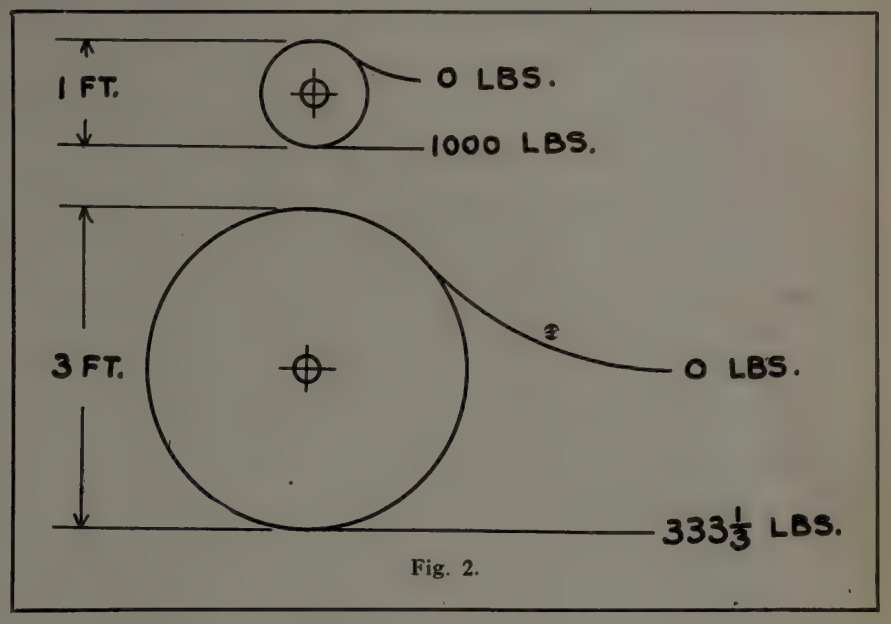

Fig. 2.

We are now ready to compute the cost of drive, exclusive of the shaft and bearings. The cost of shaft and bearings would be constant anyway, because the r.p.m. will not vary and the twisting force will be constant regardless of the size of pulley.

To determine the cost of the belt multiply the centre distance L by two and add half the circumference of pulley on A, Then half the circumference of the pulley on B. These dimensions must all be in feet. Your belt catalog will tell the cost of a 4-in. double ply belt per foot, which renders computation easy. Then add the cost of the belt to the cost of both pulleys and you will have the total cost of the drive. Next, try the 24-in. and 32-in. combination in identically the same way and make note of the total cost. The belt to be used here may have to be larger than 4-inch. Let us see. The above formula can be thrown into this form:

$$S = \frac{D\,N}{3.82}$$

whence S for the 24-in. pulley on shaft A will be 2,510 ft. per min.

2510 ÷ 500 = 5; i.e., each inch in width will transmit 5 h.p.

20 h.p. ÷ 5 h.p. = 4.

Therefore, the same 4-in. belt may be used on considerably smaller pulleys. The belt will cost less because it will be slightly shorter, the pulleys will cost less because they will be smaller, and the 24-32 combination will be less expensive.

Next, try the 21-28 combination, and then the 18-24 combination. The most economical will then be easily selected from the four totals. In this problem I have purposely omitted cost figures because I would prefer to have the reader work through a problem for himself. The method would then never be forgotten. I have followed the above through, but, as you will not, I omitted the distance between shaft centres. This is a very important factor for it will be understood, in considering the above method, that where distances between shafts are short, small pulleys and heavy belts will prove most econ-

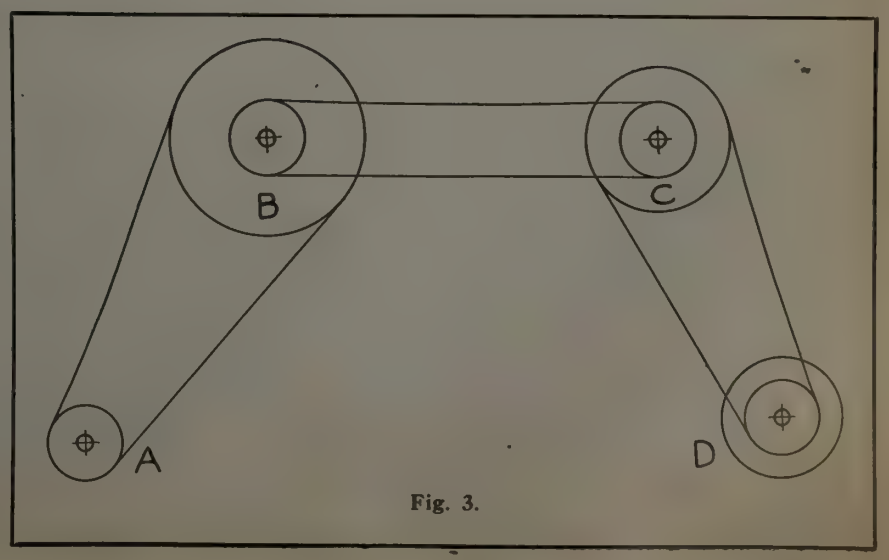

Fig. 3.

omical in first cost, whereas, where distances between shafts are great, large pulleys and light belts are best.

Good Judgment Also Required

To be sure, it is always necessary to apply judgment as well as mathematics in selecting a drive; you wouldn't order two 4 ft. pulleys for a drive having only three ft. distance between centres, for instance. Such a drive wouldn't work because the pulleys would interfere. And you wouldn't select a 4 or 6 in. pulley to transmit 10 h.p. if there were any danger of slip. Large pulleys are always the best slip preventive because they afford a much larger contact surface between belt and pulley. Large surface and close intimate contact are the great essentials. Belts and pulleys should always be so treated and handled that these two necessities will be provided.

The selection of small pulleys, just because they cost less, is a serious error, and a common one. This can be easily proved from the friction standpoint alone as indicated in Fig. 2. There I have drawn a 1-ft. pulley used for transmitting 10 horse power. The pull on the tight side, necessary to transmit 10 h.p. is computed to be 1,000 pounds, which pull, of course, must be resisted by the bearings. The greater this pull the greater will be the power consumed by the bearings in friction, friction usually being directly proportional to the pull. Then, by using a pulley three times as large, in diameter, the force necessary to transmit 10 h.p. becomes only 1/3 as much, for the peripheral speed is three times greater, and, in consequence, the bearing friction will be only one-third as great as where the 1-ft. pulley is used. Besides, you have all the non-slip and other advantages as already enumerated.

One of the most deplorable errors is the use of "old pulleys" that have been lying around the mill for years. The superintendent is prone to look upon the purchase of a new pulley as a needless waste of money if the old stock pulley can be made to do the work through some makeshift or other. If the old pulley is "just right," well and good, use it. If it is "almost right," well and good. But if it is either too narrow or too small in diameter, keep it in stock until it can be used.

There are few power transmitting mediums that consume more power than a slipping belt. I know of instances where from 10 to 20 per cent. of the speed is lost through slipping belts on pulleys that are too small. Every per cent. of speed lost means one per cent. of power lost, plus the bearing friction loss. Thus, if the initial power is 100 horse, and if the speed loss due to belt slip is 20 per cent., 20 h.p. is lost constantly. Large pulleys and proper belt care would save that loss.

Selecting the Pulley

As for selection of kind of pulley, there are three principal kinds now in use—paper, cast iron, and wood. To determine the horse power that these pulleys will carry the following formulas may prove useful. They are applicable for speeds up to and including 3,000 ft. per min., but no further. Beyond that speed the power transmitting capacity diminishes.

For paper pulleys—

$$\text{Horse Power} = \frac{S\,W\,T}{150}$$

where S = speed of belt in ft. per min.;
W = width of belt in inches;
T = thickness of belt in inches;

For cast iron pulleys—

$$\text{Horse Power} = \frac{S\,W\,T}{200}$$

For wood pulleys—

$$\text{Horse Power} = \frac{S\,W\,T}{300}$$

It is rarely necessary, however, to compute the width of the pulley. The most important thing is the belt width, which is found as already explained. Such a belt, thus determined, is amply wide for paper, cast iron, or wooden pulleys. The above formulae merely show that paper pulleys are less liable to slip than cast iron or wood, and that wood pulleys are most liable to slip. However, again, as I have already said, use large pulleys.

In these days of high speed cutting we find that a bad habit has been handed to us by our ancestors. They did not do it intentionally, of course, but we can give them a part of the blame because they were slower. This habit is illustrated in Fig. 3. A is a pulley on a motor running at high speed. It is belted to a large pulley on B in order that the main line shaft may be made to run slow, at about, say, 400 r.p.m. A few years ago all main shafts were virtually "standardized" to run at 300 to 400 r.p.m. Then, a slow speed belt was used to connect shafts B and C, which was certainly all wrong, economically, especially where the distance between B and C is great. Finally, in order to make the speed of the saw what it should be a large pulley was put on C and belted to the smaller pulley on D. I remember distinctly that this method was taught to us in college as being the proper way, but now-a-days it should be abandoned as quickly as possible in favor of direct connection of motor or other high speed driver to the saw, or, if a line shaft is necessary for distribution of power to other machines run the shaft in ball bearings at high speed. The saw can then be belted directly from the high speed main shaft, making a much simpler and less expensive arrangement. It is good practice, where possible, to connect the main shaft direct to the motor—without belting. The money thus saved in pulleys and belting will sometimes more than pay for the ball bearings. It is not so satisfactory to run shafting at high speed in plain bearings because of the much greater friction. In any case, where shafting is to be run at high speed, it must be well aligned. Prof. Goodman, of England, shows that with good alignment a shaft in plain bearings will transmit power through a distance of 6,000 feet with an efficiency of 80 per cent., i.e., the shaft could be 6,000 feet long. With ball bearings the shaft could be 120,000 feet long and the efficiency would still remain 80 per cent. A good rule for determination of power consumed by plain bearings with ordinary shafting is given by Prof. Goodman as follows: "A 2-inch diameter shaft running at 100 r.p.m. requires about 1 horse power per 100 feet when all the belts are on the pulleys. The horse power increases directly as the speed and approximately as the cube of the diameter.

This may be expressed thus:

$$F = \frac{N\,L\,D^3}{80\,000}$$

where D = diameter of shafting in inches;
N = number of revolutions per minute;
L = length of shafting in feet;
F = horse power consumed by friction."

Selection of Shafting

In selecting shafting, much depends upon the kind of material of which the shaft is made. A cast iron shaft, of course, must be much larger in diameter than a steel shaft to transmit the same amount of power. However, nearly all shafting is now made of steel, and it is most convenient to make deterimnations for size directly from the manufacturer's catalog. Nearly all hardware catalogs give complete tables, and they, to be sure, are trustworthy. In case the buyer should want to compute the size for himself, the formula is, for steel:

$$D = \sqrt[3]{(H.P./N)}$$

where D = the diameter of the required shaft in inches;
H.P. = horse power to be transmitted by the shaft.
N = revolutions per minute of the shaft.

Logging Camp Sanitation Rules

After investigating a large number of logging camps in the State of Wisconsin, Mr. L. E. Spencer, of the State Board of Health, has presented an interesting report upon camp sanitation regulations, which concludes with the following proposed rules:

From this report, and from ideas gathered from other states and the Dominion of Canada, where similar rules are in effect, the following regulations were formulated.

I will take up these regulations in numerical order, and give very briefly some reasons for their adoption.

Regulation No. 1.

Hereafter operators, contractors, and all other persons who may establish an industrial camp or camps, for the purpose of logging, ice cutting or any of like indutsry, or for the purpose of construction of any road, railroad, or other work requiring the maintenance of camps for men engaged in such work, or any other temporary or permanent industrial camp of whatever nature, shall report to the State Health Officer concerning the location of such camp or camps and shall arrange and maintain such camp or camps in a sanitary condition as outlined in these regulations.

This regulation is self-explanatory. In case the health officer's assistance is needed it will make it much easier to reach camp promptly.

Regulation 2.

The term "camp" as used in these regulations shall include any lumbering, mining, railway construction or other camps where men are employed and housed in temporary quarters; such as cars, tents, buildings or other enclosures other than the bona fide homes of the employees.

Regulation 3.

Every camp must be located on a site that is high, well drained and shall be selected with regard to its healthfulness.

Regulation 4.

The general scheme of the structure of the camps should be as follows: Stable and kitchens should be separated by a distance as great as consistent with the natural topography of the land and so located as to prevent any pollution of the water supply, with the necessity in mind for convenient access to the stables. The stables

and toilets for the men in the camp must be so located that their natural drainage is away from the water supply.

Passing by regulations 2 and 3, which are self-explanatory, will say that regulation 4 we believe to be along the lines generally followed by camps. It is nothing new or unusual and in the majority of camps good judgment is used in this matter.

Regulation 5.

The use of the toilets provided for the men should be made obligatory, and instant discharge of any employee polluting the soil must be rigidly enforced.

This is only good sense and common decency, and I think all will agree with me that the ruling is reasonable.

Regulation 6.

Every building car, tent or other enclosure occupied as sleeping quarters by the employees engaged in any camp or works shall contain at least 225 cubic feet of air space for every occupant thereof and shall be supplied with windows for purposes of light and ventilation, constructed to open.

It is possible there may be some difference of opinion as to the cubic air space necessary for each occupant of a camp. The ordinary ruling, in most States, covering hotels and other public places, calls for about 400 cubic feet. When you stop to consider that 225 cubic feet only means a space of 6 ft. 3 in. by 4 ft. by 9 ft., I think you will agree it is not putting the space too great. Of course the matter of ventilation has a great bearing on this, and with extra good ventilation, less air space might be sufficient in some instances.

Regulation 7.

In addition to windows there shall be other means for ventilating sleeping, dining and living quarters by having inlet and outlet ducts of sufficient area provided to keep the atmosphere reasonably pure. Such provision shall be to the satisfaction and meet the approval of the State Board of Health.

We all know that sunlight and dry fresh air are very beneficial to health. We also know that poor ventilation and dark rooms lower the vitality of the occupant. The average humidity of the outside air is 60 per cent. to 70 per cent. of the total saturation, while due to poor ventilation and other factors, the humidity of the average building heated by stoves, in the winter time, is only about 30 per cent. of total saturation. The heat of the stoves, in most instances, completely drives out the moisture, unless additional moisture is provided at all times by good ventilation. In just the same way as the air is dried, naturally the moisture of the skin is reduced in amount, and it is stated by good authorities that the activity of the lungs is influenced by the condition of the skin. The importance, therefore, of good ventilation in camps can be recommended as an economic factor, if for no other reason, in that it increases the energy and efficiency of the crew.

"Inlet and outlet ducts," referred to in this section, may be interpreted as calling for roof ventilators, which may be for the purpose of lighting also. If sash is used, there should be at least one opening 2 ft. by 2 ft. for each 500 feet of floor area, or fraction thereof. This may be fitted with an ordinary barn sash (of four 10 in. by 10 in. lights), hung on hinges, so as to be easily opened and closed.

If the camp is well lighted by side windows, the skylight may be eliminated, and ventilator ducts installed in the roof. These may be made of hemlock ceiling or other cheap material, and have an inside measurement of about 15 inches square for each 500 square feet of floor area. The flue should be capped and trimmed out on top, except at the corners where the cap is supported, to allow a circulation of air and at the same time protect the camp from the elements. Ventilator ducts constructed in this way would be stationary, and not easily closed, and possibly for that reason would be preferable to sash, which could be easily lowered.

Of course it should always be borne in mind that the cold outside air should enter at or near the ceiling, so it will blend with the warmer air which is constantly rising, and thereby become somewhat warmer before it settles to the floor.

It is realized that it is only in exceptional cases that any regulation of this kind may be needed, as many of the camps of the principal loggers operating from year to year are already provided with ventilation area in excess of these requirements.

Regulation 8.

The kitchen and eating house should be effectively screened when used during the summer months. The bunk houses should also be screened if used during the summer. All food supplies must be carefully scerened from flies and other vermin.

One of the principal reasons for screening the kitchen and food stuffs is to prevent disease. It is an established fact that flies may carry the excrement which has not been promptly and thoroughly disinfected, from some case of typhoid in the neighborhood, or from some open vault that has been used by a typhoid carrier, to someone's food, and so introduce the germs into another system.

Regulation 9.

All garbage must be collected in covered cans and incinerated, buried, fed, or hauled away to some remote place.

This regulation may be interpreted very broadly. It simply means that the garbage shall be disposed of in some manner, a considerable distance from the camp.

Regulation 10.

Non-inflammable refuse, such as tin cans, should be collected daily, and placed in a deep earth pit and covered with a light covering of earth each day, or covered with oil and burned over. During the winter season, this material as well as the garbage, may be deposited at a point at least 100 feet from the camp, and then properly cared for at the first opportunity in the spring.

Regulation 11.

Waste water from the kitchen, wash and bunk houses in summer camps must be carried to trenches lined with quick lime, and at a safe distance from water supply.

A good reason for the proper disposition of waste water from the kitchen is that it contains considerable organic matter, which is subject to decomposition. This causes a stench, and flies breed rapidly.

Regulation 12.

There must be a thorough and systematic scrubbing of kitchen and eating-houses at least once each week. The floors should be swept daily. (Dry sweeping is prohibited by law.)

I think that most camps are at present receiving more attention than this regulation suggests.

Regulation 13.

The supply of water for the camp should be carefully decided upon, and an adequate supply free from any possible chance of contamination must be provided.

The location of the well depends upon the character of the soil, depth and kind of well and the natural topography. Into a surface well, the soil water seeps from a considerable area about it, probably 50 feet to 100 feet. This water seeps steadily toward the stream or spring which drains the neighborhood. The direction and flow of the soil water should be noted, and the toilet and stables located down stream from the well. Wells may be polluted with typhoid germs from near-by vaults. This usualy happens by surface water, during rains, washing the contents of the vault toward the well, which is not walled with cement above and below the surface, and not raised properly above the ground.

Regulation 14.

All sick from whatever cause must be isolated from the remainder of the crew immediately.

I think this will be interpreted that those who become ill with some communicable disease should naturally be sent away from the camp or isolated, if possible, in the interests of the remainder of the crew.

Regulation 15.

All persons engaged in the care of the premises, and handling of the food, particularly cooks and helpers, should be carefully examined and particular attention paid to the point as to whether or not they have suffered from typhoid fever or tuberculosis within recent years.

This rule applies to typhoid, especially, as a person who has had typhoid fever in a recognized or unrecognized form, from one to a great many years previously, may still carry the germs of the disease in the bowels and sometimes in the bladder. It has been shown that about 3 out of every 100 persons who have had typhoid fever, continue to carry the germs of the disease. By "carriers" I mean people who have had typhoid fever years before and still unknown to themselves, have the germs in their systems. Those who are sooner or later recognized as such are those whose occupations bring them in contact with food supplies—cooks especially. When a cook gives a history of several occurrences of typhoid fever in a number of places where he has worked, a bacteriological examination of his bowel discharges will nearly always show the presence of typhoid germs. It can be seen from this what a great amount of trouble can be made by having a cook who is a "carrier" in a camp.

Regulation 16.

Floors in bunk houses should be swept daily and scrubbed with hot suds at least once each week. (Dry sweeping is prohibited.)

This, I think, is reasonable, and is probably carried out in the majority of camps as fully as is required.

Regulation 17.

All bunk houses should be provided with floors, and the lower tier of bunks should be raised at least six inches above the floor.

This is only asking what we consider reasonable for nearly all operators and jobbers. It is only in rare instances that the bunk houses are found without floors, and the first tier of bunks on the ground.

Regulation 18.

All blankets should be hung outside for airing at least twice a month. Bunks should be furnished with clean straw, hay, or ticks filled with same. Mattresses are not recommended as they cannot be cleaned easily.

Cheap mattresses are used in some camps, but this board is of the opinion that straw or hay is preferable if changed occasionally, as it is impossible to clean and disinfect one of these mattresses when it is soiled or infected.

Regulation 19.

Toilet facilities shall be so constructed at every camp that they may be effectively cleaned of the contents. Pits shall not be less than four feet in depth and the contents shall be treated daily when used during the summer season, either by a solution of milk of lime (strong whitewash of fresh slacked lime) one gallon to every square yard of pit, or the sprinkling of five pounds of powdered chloride of lime to the same area. A liberal sprinkling of fresh chloride of lime shall also be applied daily to the floors of toilets and lavatories. All closets shall be at least 100 feet distant from the water supply, and so located that drainage from vaults toward water supply is impossible.

A fault common to camps is the lack of good toilet facilities. By keeping a little whitewash handy to the toilet, or a little powdered lime, the vault can be kept in much better sanitary condition.

Regulation 20.

Whenever smallpox, diphtheria, or scarlet fever shall appear in any camp, it is the duty of the physician in charge, the contractor or the superintendent of such camp to notify the local health officer in whose district such camp is located, within twenty-four hours, and it is the duty of such health officer when thus notified, to see that said patient is removed to a proper place of isolation, or to place such patient or patients under quarantine at such camp, and the contractor or superintendent, when necessary, shall provide suitable accommodation for such patient or patients.

This is practically the same as the old health rules governing contagious diseases, and of course it will be policy for operators of camps to promptly call the health officer of the district in which the camp is located, to remove the patient to some place of isolation, so he will not infect others of the crew; thereby avoiding expense and trouble, not only for the township, but for the operator as well.

Regulation 21.

Copies of these regulations shall be hung or posted in every kitchen, dining-room, sleeping room or other building in camps where employees may frequent the same in order that all may be conversant with their requirements.

The following information should be furnished on the establishment of any camp and thereafter annually to the State Board of Health, Madison, Wis., by the owners or operators of all camps to which the foregoing regulations apply. Returns to be made each year during the first month of the operation of the camp.

The Motor Truck in the Lumber Business

The motor truck has made great advance of late in its invasion of the lumber business and from all present indications the future will see its wide use in connection with the delivery of stocks of lumber. The use of a truck, to put the matter briefly, enables a company to make quicker, larger and more satisfactory deliveries. It reduces the cost of delivery, simplifies the business of the delivery end, and, last but not least, advertises the owners of the truck as a firm with modern business methods, and capable of making quick delivery over a wide area of country.

The Boake Manufacturing Company's Trucks

The Boake Manufacturing Company, Limited, Toronto, bought their first Packard truck in July, 1912, after having had an expensive experience with a truck not properly built to stand the severe conditions of lumber hauling. From his initial experience, however, Mr. Boake had learned the great advantages of a motor truck in the lumber business equipped with quick loading and unloading device, and adapted a Packard body which had been in use in Portland, Oregon, to his own requirements. The result is a body with a platform of the ordinary height and having four rollers in the platform. Trestles, as shown in the illustrations, are used, the load being piled on the trestles in such position that the truck can be backed under the load, knocking down the trestle with the single leg and rolling the load on to the truck. When the load lifts off the rear trestle, it can easily be jacked forward into position with a crowbar.

To dump the load, the crowbar is used to jack the load off in the same way as an ordinary roller-bolster lumber wagon is operated, and when the load has tipped the truck is drawn out from underneath and the load drops to the ground without causing any more damage to the lumber than if it had been dumped from a horse drawn wagon.

With this device it was found that the average time required to load was from 5 to 8 minutes and that the load could be taken off in from 3 to 5 minutes. A number of sets of trestles were made and placed at convenient points throughout the yards and in the mill, so that one or more loads could always be in readiness for the truck. Mr. Boake's trucks are thus kept constantly on the road, and it is generally acknowledged that no one in Toronto operates motor trucks to any greater advantage than his company.

After six month's experience with his Packard, Mr. Boake pur-

Boake Mfg. Co.'s Packard Truck Taking on a Load

Boake Mfg. Co.'s Packard Truck Delivering a Load

chased an additional truck and at the present time has his order in for the third Packard. During the busy seasons this company often operate their trucks 14, 16 and even 18 hours a day, deliveries being made in daylight to city jobs where it is necessary to arrive while the men are at work, and long runs being made to surrounding towns in the evenings.

During the month of July each of the trucks averaged 51 miles per day and Mr. Boake estimates that each of them did the work of three teams. In speaking of the work of his trucks recently, Mr. Boake said:—

"Besides enabling us to give very much better service to our customers and simplifying our entire delivery problem, we find the truck to be of value to us because of the business it brings which we would not otherwise get. We have repeatedly received orders from people whom we had never heard of and who stated they had seen our trucks pass their places on the country roads and knew that we were in position to make delivery to them. Also, at slack seasons of the year, we are enabled to take orders at a distance from our plant which would be prohibitive if we had to depend upon our horses. I have been surprised many times at the ability of the trucks to make deliveries alongside of new houses where the ground is soft and the conditions not favorable to motor truck use. With the block tires we are able to get traction practically any place where there is any bottom whaever, and while our trucks occasionally get stuck in the spring and fall, we have no more difficulty in this respect than we would have with our teams.

"I have given considerable thought to the question of depreciation on motor trucks and have come to the conclusion that 100,000 miles is the power figure on which to base depreciation. For example, if our trucks did 15,000 miles in a year, we would charge off 15 per cent for depreciation for that year. Just the other evening our No. 1 truck was leaving the yard as I was going home to dinner and I got on the truck with the driver, and so far as I could judge, the truck was running as well as when it was new. I suppose one must charge depreciation, but as yet I can see little sign of the trucks ever wearing out.

"I consider the essentials of successful truck operation in the lumber business, to be first, buy a good truck; second, have a body which can be quickly loaded and unloaded; third, get a good man to drive it, and fourth, always have your loads waiting for the truck and thus keep the truck on the move."

Gibson, McCormack, Irvin Company's Packard

A Packard truck belonging to the Gibson, McCormack, Irvin Company, Limited, Toronto, was delivered in June, since which time it has been almost exclusively engaged in long haul work from West Toronto to the East Toronto section and in trips to Islington, Cooksville, Brampton, etc. It is a Packard of three ton capacity and equipped with roller body similar in design to that used by the Boake Manufacturing Company. Before the truck was purchased, Mr. Irvin was doubtful of his ability to keep it busy on long hauls, but in common with other truck owners he has found that the truck itself is a good advertisement and that a certain amount of additional business comes from the mere fact of ownership of a truck.

Reid & Company Operate a Packard

Reid & Company, or Toronto, have owned a Packard three-ton truck since April, 1913. It is equipped with a roller body and has a platform length of 14 feet. Special brackets were placed on the front bumper which permit of placing extra long lengths of lumber at each side of the driver's seat, although this arrangement is not necessary on any lumber of 22 feet length or less. As Reid & Company are located on the Esplanade, practically all of their hauls are up hill and this truck has proved its superiority to horses time and again in extremely hot weather and in slippery weather.

R. Laidlaw & Company's Truck with a Load of Shingles

R. Laidlaw and Company, Toronto, and J. B. Smith and Sons, Limited, Toronto, also operate motor trucks in connection with their large delivery business. A picture of the Laidlaw Company's truck is shown in one of the illustrations.

Canada Lumber Company's White Truck

The accompanying illustration represents a motor truck operated by the Canada Lumber Company at Weston, Ont., which was furnished by the White Company, Cleveland, Ohio. The Canada Lumber Company have operated this truck for two years and are convinced that it is not only a cost saver, but a labor and trouble saver, in connection with their work. Figures which they have prepared in connection with the operation of the truck during 1913, show that, driving over the worst possible roads, and making two trips a day, the truck cost on an average twenty-eight cents per ton mile, or an average per day of $11.10, on a basis of an average run of forty miles per day, carrying a load of three tons. These figures were compiled on work from November, 1912, to June, 1913. When the truck crossed the 6,000-mile mark, the books were balanced, and showed the above results. The truck reached the 6,000-mile mark on 564 gallons of gasoline, or an average of 15.8 miles per gallon.

Referring to these figures, Mr. L. F. Strickland, of the Canada Lumber Company, reports that the company were then buying their tires on a 6,000-mile guarantee. In estimating the total cost of the car and its operations, they included gasoline, oil, grease, repairs, incidentals, a depreciation of 10 per cent per annum and interest at 5 per cent on the investment. The estimated cost of the oil moreover, was placed at 25 cents per gallon, the retail price, whereas the actual cost of the oil, which was purchased wholesale, was fourteen cents per gallon. There were certain charges entered also in bulk which should have been worked out on a proportionate basis covering a longer period, so that the costs, as finally figured out, were decidedly conservative.

This truck is running on trips of about eight miles each way, over bad country roads. In the spring and fall of the year the truck is down practically to its axles in clay. It goes into all conditions of holes, etc., around new buildings. The company report that they have had no difficulty whatever in getting the car to do its work. They estimate that the car is dong the work of six teams of horses, and say that it is a question whether six teams of horses would be able to go the distances required in the course of the day's work.

A Little History of Business Progress

Forces Which Have Led to Rapid Expansion in an Important Machinery Manufacturing Firm—The E. Long Manufacturing Company, Orillia, Ont.

A POINT upon which most business men agree, is that there was never a business that "just grew." The story of the progress and success of any business undertaking, is just the story of the efforts of the group of men, or succession of men, who have pulled, and pushed, and co-operated with one end in view; and when we see more than usual success fall to any business, our inteerst lies in the more than usual human effort that lies behind.

When we visited the splendid modern factory of the E. Long Manufacturing Company, at Orillia, a few days ago, it presented such a remarkable contrast to the deserted group of buildings, just across the track, that the two plants would not be associated in the mind of the casual observer. The disparity in size is so marked that it would not seem possible that the one should develop from the other, yet the big factory, already showing signs of becoming too small, represents just one step in the progress of this modern concern, and it was not so very long ago that the old plant was deserted, and the scene of activity was moved across the track.

But this recent development is probably not so spectacular to those who shaped the policy, and laid the foundation of the business, some time ago.

Origin of the Business

It was back in 1878, when Robt. Brammer bought out Bateman's little machine shop, that the history of the plant, as a manufactuirng establishment, really started. Previous to that, it had only been a repair shop, but Brammer had an idea that it would be good business to have something to work on between jobs. He was ambitious, and he saw an opportunity in a shingle machine, the patent on which was owned by I. M. House. This machine evidently gave its builders quite a lot of trouble, but Brammer was not the kind to be stuck by a shingle machine. A patent of Wm. Wiley's, on the feed works, was incorporated, and Brammer himself spent so much time on it, and to such good purpose, that he at last produced an article, the efficiency of which gave him quite a reputation throughout Ontario's shingle making territory. This machine, known as the "Clipper" is still made by the E. Long Company.

Brammer did not allow experimental work to interfere with his established business, but, following the success of the "Clipper," other machines, needed in the shingle business, were, from time to time, developed and manufactured.

Additions were made to the little shop as the business demanded, and when Brammer died in 1895, the factory was a well-etsablished, going concern, with a policy. His picture occupies a prominent place in the present office of the company, as a tribute to his memory, and to keep alive the Brammer idea.

After Mr. Brammer's death, the business was run for a time by the Brammer Estate, then by Long and Thompson. The financial stringency made the history of the business uneventful during that period. Any great expansion was impossible, and the business was carried on without any additions of note being made to the line.

Birth of the Present Firm

In 1900 the E. Long Manufacturing Company was formed, and it was about that time that the possibilities of entering the wider field of the wood industry were first considered.

The first saw mill machine built was a carriage, and it was a good one. More carriages were ordered, and just as the perfection of the "Clipper" led to a complete line of shingle machinery, so the "Long" carriages, which first earned the reputation of "Long Quality," led to a line of lumber manufacturing machinery that now includes practically everything used in this great industry. The reputation for quality, gained by the carriages, was studiously lived up to in the subsequent machines, and the development of the line was solid, rather than rapid. All the energy of the plant was confined to the one business in hand.

It is, then, not surprising that along about 1908, the shop, with all its additions, became too cramped to handle the work. The new plant was projected, and was occupied in the sprng of 1909.

The present shop is of reinforced concrete, "daylight" construction. The main building is divided longitudinally, the roof on the front portion being carried considerably higher to accommodate the big travelling crane that serves the erection shop. This construction also admits a greater amount of light right into the centre of the shop, than could otherwise be obtained. The rear portion of the main building is the machine shop, which is served by several smaller travelling cranes, and a number of gib cranes, conveniently placed. The arrangement of the machines has been made with great care, to obtain the most direct possible routing of material; various classes of work being confined to different portions of the erecting shop, to carry out this idea. The shop is electrically driven throughout, each machine having a separate motor, with the exception of some of the smaller ones, which are grouped.

The wood working and pattern shops are in the wing, extending to the rear of the main building, at the right hand end. This end of the erecting shop is devoted to setting up carriage and saw frames, machinery into which a certain amount of wood construction enters.

The left hand end of the main shop is used for structural work, and in the wing, extending from this end of the building, are the forge and plate shops. The tool room and stock room are in the angle between the forge and machine shops, convenient to both places.

Back at the end of the forge shop wing, is the foundry. This occupies a building of the same height and construction as the erecting shop. The whole floor is served by a single travelling crane.

For heating the plant, a hot air blast system is used. Steam coils are supplied by an 80 horse-power boiler, and through these coils, air is forced by a 72-inch fan, and is distributed to all parts of the plant.

There is an excellently appointed room for the men, containing lockers, and lavatories.

The pattern storage occupies a separate building, located at a

E. Long, President.

The old factory of the E. Long Mfg. Co., Orillia, Ont.

distance from the main group, but convenient to both pattern shop and foundry.

Shipments from the shop can be made direct over any of the three big systems that enter Orillia; the G. T. R., C. P. R., and C. N. O. The shop is supplied with two spur tracks, one entering the main building for loading, under the crane; the other running along the outside of the shop past the plate shop, stock room, heating plant and foundry, for incoming supplies.

The office, built in general keeping with the shop, has an interior beautifully, yet simply, finished. The ceilings are lofty, and panelled in quartered oak. The main floor contains the offices of the president, secretary, superintendent, and the general office. The vault is carried up through the two storeys, the upper part being used by the engineering department. On the second floor of the office is the drafting room, blueprint room and the photo department with its dark room.

The whole plant is absolutely fireproof, a fact which means much in dependable and continuous service to the lumberman.

The Men Who Are Responsible

The dominant figure in the more recent upbuilding of the business has been Mr. Long. Mr. Long was born on a farm in Oro township, a short distance from Orillia. In 1881 he started as an apprentice with Robt. Brammer, and was thus in touch with the business in its earlier days. After completing his apprenticeship, he went to Chicago, where for ten years he was associated with the Weir & Craig Manufacturing Company, with whom he remained until he returned to Orillia in 1895, to become the administrative head of the business with which he started. It was Mr. Long who felt that the shingle business was too circumscribed, and who first saw the possibilities of serving the larger lumber industry. Mr. Long is a specialist, and makes a doctrine of doing one thing well. Once started on saw mill machinery, the attention of the company has never been allowed to be diverted from that line, and the result of the wisdom of this policy must be highly gratifying to the one who has carried it out. Mr. Long has plenty to do, is always on the job, and enjoys it immensely, but he also takes a keen interest in municipal affairs, especially in connection with the Town's Hydro-Electric plant at Ragged Rapids. When the Water, Light and Power Commission was formed two years ago, Mr. Long was selected as chairman, a position in which he is still making things go.

Mr. Frank Smith, Vice-President and Superintendent of the company, was also connected with the firm in its earlier days. He served his time under Long and Thompson, but, like Mr. Long, he went to the States after learning his trade. Going to Michigan, which was at that time the very centre of the lumber indutsry, he gained much practical experience in the mills there, at first hand. He was with the Wickes Bros., at Saginaw for several years, and that he made good use of his time in the shops and around the mills, can be seen by many of the very practical devices embodied in the machines the company are building, as well as by the clock-work organization by which they are built. Mr. Smith returned to Orillia in 1899, and has had his full share in the development that has taken place, up to the present time.

W. W. McBain, Sec-treas.
E. Long Mfg. Co.

Frank Smith, ice-president
E. Long Mfg. Co.

W. W. McBain, the Secretary-Treasurer, has spent practically his whole business career with The E. Long Manufacturing Company. As to his qualifications for holding this position, we need say no more than that he is an expert accountant, is of Scotch descent, and possesses the peculiar ability attributed to that race for careful financing.

In going through the place, we noticed particularly, a number of different machines that are built in single unit castings. One fine example of this is a big Pacific Coast Edger, in which the main frame, outboard bearing, bridge trees, the housings to carry the press rolls, and even the lower head of the cylinder, are all made in a single casting, as intricate as it is bulky. Such a machine could not be made in a shop less completely equipped than this one, yet we saw it handled and machined with the greatest ease, all as part of a day's work. This same tendency to unify machine castings we saw in a number of other instances, and of everything we saw in the plant, we believe that this act of concentrating to gain efficiency, is the one most truly typical of the establishment.

That they will continue to grow, we have no doubt. They tell us confidentially that they have just started.

A movement is on foot to make a national park out of 750 acres of green timberland in the lower Fraser Valley, a few miles south of New Westminster.

The new factory of the E. Long Mfg. Co., Orillia, Ont.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

7-t.f. Toronto, Ont.

Wanted-Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents.

Position as Band Saw Filer wanted in mill or factory where there are band resaws. A1 references. Box 71, Canada Lumberman, Toronto. 16

Position wanted as practical sawmill foreman. Twenty years' experience. Can furnish the best of references. Address Box 51. Canada Lumberman, Toronto. 14-t.f.

Wanted position as shipper or foreman or both in small plant, soft or hardwoods, twenty-five years' experience. Can furnish first class references. Box 56 ,Canada Lumberman, Toronto. 15-17

WANTED—Position in Saw or Planing Mill. Office and mill experience. Could take charge of Sales, or act as Mill Foreman or Yard Foreman. Excellent references. Box 44, Canada Lumberman, Toronto 13-16

EXPERIENCED SUPERINTENDENT wants position to take charge of lumbering operations, bush, mill, etc. Desires a change. Can get results and furnish the highest credentials. Box 46, Canada Lumberman, Toronto. 13-17

Woods or Mill Manager—Position wanted in New Brunswick by thoroughly experienced manager, who has had 17 years' experience in woods and mill management, has always been successful in handling large crews and understands all details of the work, is a first class bookkeeper. Has been for upwards of ten years with firm of lumbermen at present employed by. First class references; can be at liberty in two months. Address in first instance Box No. 57, Canada Lumberman, Toronto, Ont. 15-16

Wanted-Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

---

Wanted—Man with experience in getting out saw logs from stump to mill. State salary and references. No boozers need apply. Box 62, Canada Lumberman, Toronto. 15-16

Woods Manager Wanted

Thoroughly practical man required to take charge of large woods operation; must have considerable experience in driving. Salary one hundred and twentyfive dollars month, with increase after ability is shown. Apply by letter ,stating experience and references, to Box 200, Canada Lumberman, 119 Board of Trade Building, Montreal. 15-16

Business Chances

For Sale

Timber Limits, principally Hemlock, also Pine, Spruce and Hardwood. Also Saw-mill, logging and driving outfit. For particulars address Box 52, Canada Lumberman, Toronto 14-17

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest. If your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf

---

An Opportunity—Sawmill Wanted

for Hardy Bay, north end of Vancouver Island, B.C. Fine harbour, projected terminal for C. P. R. Free site and bonus for responsible parties. Large amount of timber (gratis) in immediate neighborhood. Write for full information. Bagshawe & Co., 214 Pemberton Building, Victoria, B.C. 15-1

For Sale

Rare bargain. Band mill located in best lumber and log center on Puget Sound. Rail and cargo shipping facilities. Excellent log pond. Ten and a half acres of land. Price one-fourth of appraised valuation. Must sell quick. Box 765, Canada Lumberman, Toronto, Ont. 8-t.f.

For Sale—Cheap

400 acres of good land well timbered with virgin timber, beech, hard maple, red and yellow birch, ash, hemlock, basswood, elm, spruce, and cedar, containing about 2,000,000 feet of lumber. Never had fire. Situated about two miles from Emsdale Station, G.T.R. Slightly descending road with no hills. Price $10 per acre. Investigate. Address B. D. M. Box 22, Emsdale P. O., Ontario. 16

For Sale
Timber Limits and Saw Mill

Limits No. 59 River Gatineau, 3 square miles, and No. 483 Grand Lake Gatineau, 40 square miles, say 43 square miles, under Quebec Government Licenses. These limits are well wooded and contain Basswood, White and Red Pine, Spruce, Birch, Poplar, Cedar, Pulpwood, etc., also New Waterous 8-ft. Improved Double Cut Band Mill, fully equipped and up to date 200 H.P. Engine, 2 Boilers, Alligator, Boats, Booms, Logging Gear, Waggons, Trucks, etc., Buildings, Camping Outfit, etc., situated at Matts Bay, 31 Mile Lake, P.Q., about 50 miles from Ottawa. This plant has only been in use three years and is in condition to start operations at once.

Miscellaneous

Saw Mill Machinery For Sale

Sawmill near Sellwood, Ontario, daily capacity 60,000 feet. All machinery including:—Log Ladder, Bullwheel, Steam Kicker, Log Loader, Stationary Steam Nigger, 42-in. Steel Carriage, 10-in. Steam Feed, 8 ft. Double Cutting Bandmill, Cast Iron Lumber Table, 5-Saw Slab Slasher, 48-in. Big Champion Edger, Trimmer, Transfers to Edger and Trimmer Tables, Sorting Tables, etc. Also, Independent Lathmill, Filing Room Outfit and Power Plant complete. This machinery is of the latest design, practically new and in excellent condition. Offers will be accepted for all or any part of this machinery, where it stands or F.O.B. cars Sellwood.

The Waterous Engine Works Company,
22-t.f. Brantford, Canada.

A Notable American Lumber Ship

Some interesting particulars are to hand respecting the American steamer Atlantic which has been specially designed for the lumber carrying trade between Boston and Seattle, by way of the Panama Canal. Special consideration has been given to stowing lumber cargo in longest lengths, as well as shipping the longest sticks of Douglas fir carried as a deck load. In view of the regula-

tions of the British Merchant Shipping Act concerning the carriage of timber on deck, the construction of the Atlantic is specially interesting, as the general idea in America is that provided sufficient stability be given a vessel and special arrangements made for securing a deck load, so that it cannot take charge in any contingency likely to be experienced, there is no special danger attached to the carrying of deck loads. The three large holds into which the vessel's hull proper is divided have been constructed without any obstructions whatever, enabling the hold cargoes to be efficiently and economically stowed, and for the deck load, provision has been made by making not only the midship quarters in the form of an island house, but the forecastle has been similarly constructed, enabling long spars to be rove through the large lumber ports in each bow and passed along deck for an unobstructed length of 300 ft. The island feature of these two erections, together with solid boatswain store houses at the base of each mast affords a splendid support to the lateral movement of the deck loads, which, in combination with the Pacific method of securing the load, when properly stowed on deck by chains secured to the sheerstrake and passed over the load from side to side, with turnbuckles to take up the slack, results in building a deck load which has all the stability and homogeneity of an erection itself. It is computed that the Atlantic, with a moderate deck load, will carry 5,000,000 board feet of lumber, or alternatively, a total bulk dead weight of 9,000 tons.

Power Under Provincial Charter

The Dominion Government will ask leave to appeal to the Privy Council of Great Britain from the judgment of the Supreme Court of Canada, that a company operating under provincial charter is not confined to its own province. The outcome will be awaited with much interest by pulp and paper companies of Canada. The financial stringency is having a marked effect upon the incorporation of federally chartered companies in the Dominion. During the past fiscal year the number of companies chartered was 758, with a total capitalization of $425,307,569, as compared with 939 new companies with an aggregate capital of $680,762,199 for the previous fiscal year.

Wayagamack Had a Good Year

With the end of June the fiscal year of the Wayagamack Pulp and Paper Company, of Three Rivers, Que., was closed. The period just ended has been a very good one in the demand for kraft paper, although it has not been a particularly easy thing to market the output. Bond interest and all charges have, however, been met, and the report will show, after all deductions, a fair percentage earned on the common stock of the company, which has $3,500,000 bonds and $500,000 stock outstanding.

Willow Flooring

In England certain kinds of floors are made of willow in preference to other woods. It finds its place in warehouses, stores, factories, and in other places where trucks are trundled over the floors and wear is great. It is tough, though not very hard, and it does not splinter or split. All parts of the surface wear evenly, and it acts like a cushion under the jolting of wheels. That is the chief quality in its favor. It causes less noise than floors of harder wood. Its behavior is much like that of black gum when used for flooring. Willow is cheap, and at present its most important use in this country is as box material.

Cleans a building of Rats and Mice in short time, keeps it cleaned, for it is always ready for use. Made of galvanized iron, can't get out of order, lasts for years. Large number can be caught daily. Go to Catcher mornings, remove device inside, which only takes few seconds, take out dead rats and mice, replace device, it is ready for another catch. Small piece cheese is used, doing away with poisons. Catcher is 18 inches high, 10 inches diameter. When rats pass device they die, no marks left on them. Catcher is always clean. One of these Catchers set in a livery stable in Scranton, Pa., caught over 100 rats in a month. One sent prepaid to any place in Canada or United States upon receipt of $3. Catcher, 8 in. high, for mice only, prepaid $1. On account of shipping charges being prepaid, remittance is requested with order.
H. D. SWARTS,
Inventor and Manufacturer, Scranton, Pa.

Ontario Lumber Company Limited
In Liquidation

The undersigned invites tenders for all or any of the following Timber Limits in the District of Parry Sound, Province of Ontario:

Township	Berths	Area (sq. miles)	Estimated quantity timber
McConkey	1, 2, & 4	56¼	About 117,000,000 feet, including 70 million feet of Hemlock and about 15 million feet Birch
McConkey	Part 3	4¼	
Hardy	3	20¾	About 33 million feet, including 15 million of Hemlock and about 9 million feet of Birch
			Less 10 million feet in above 2 townships
Mills	1	23½	About 54 million feet, including about 31 million feet Hemlock and about 11 million feet Birch
Pringle	1 & 2	43¾	About 38 million feet, including about 16 million feet Hemlock and about 12 million feet Birch
Lount	3	18¼	About 28 million feet, including about 13 million feet Birch
Machar	Part 2, 4	15	About 5 million feet—Hemlock and Birch
Gurd	1	18¼	About 5 million feet—Hemlock and Birch
Henvey, or Broken Front	6	73	About 7 million feet—mostly white and red pine

The above areas, timbered, are covered by Government Licenses renewable from year to year. Estimates are taken from the Company's records.

The undersigned also offers for Sale, on behalf of the Creditors of the Company, the French River Mill property and equipment, the property of the above Company.

The lowest or any tender not necessarily accepted.

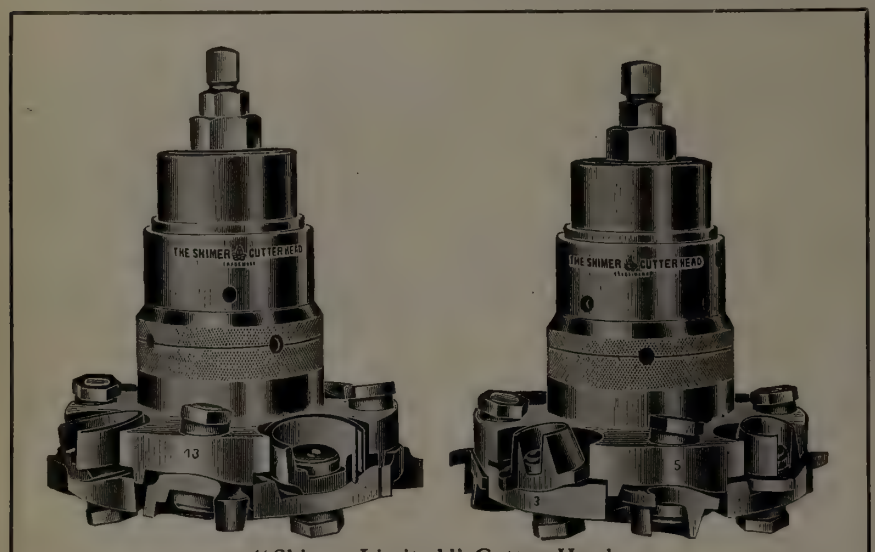
Liquidator
2 Leader Lane, TORONTO

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

Shimer Limited Cutter Heads

The accompanying illustrations represent the "Shimer Limited" cutter heads which are widely known among lumbermen as one of the most important parts of the equipment of any mill using a matcher. It is now some forty ywears since the Shimer cutter head was introduced, and marked the beginning of a new era in matching lumber. Previous to that time the product of no two mills in the country would match into the same floor. It was only with the introduction of these time and labor saving tools that the several lumbermen's associations adopted certain proportions as the standard tongue and groove for certain thicknesses of flooring. Soon builders in making up their orders began to specify that the flooring to be furnished was to be matched with Shimer cutter heads. Today standard sizes have become uniform the country over and flooring strips



"Shimer Limited" Cutter Heads

shipped from the State of Maine will fit the flooring strips coming from the State of Texas, and may be worked into the same floor.

In appearance the "Shimer Limited" series of cutter heads resemble the older patterns of these famous tools but differ therefrom in the method of attaching to the spindle; in the construction of the bit seats; of the bit designed for faster cutting; in the greater strength of the holding bolts, and in the self-centering device which clings to the spindle when drawn up, securing it firmly thereto.

The "Shimer Limited" cutter heads are made from solid steel forgings of 60,000 lbs. tensile strength, which are shaped under a powerful steam hammer until the grain is further solidified and refined, making a tool which has no equal for strength. They are carefully balanced and the Bits are jointed to insure all of them doing their share of the cutting.

These tools must be seen at work to be appreciated. Like all Shimer products they are sent on trial, returnable if not satisfactory. Send for a set and give them a try out on your fastest machine. Address Samuel J. Shimer & Sons, Milton, Pennsylvania.

Handling Lumber by Gravity

One of the problems that faces the lumber manufactured of today, is the handling of the manufactured stock from the mill as expeditiously and economically as possible. Many lumber mills in Canada add considerably to the cost of the finished product by antiquated methods of handling and rehandling before the lumber is finally on the cars or the vessel.

A firm which specializes in the handling of the finished product, one which it would pay lumbermen to consult, is the Canadian Mathews Gravity Carriers Company, of Toronto. Just imagine a double row of steel rollers assembled in a steel frame having a total width of 17 inches, extending from a freight car on the siding to your piling grounds or sheds, and the reader will have a correct mental pictuer of one of the methods by which this company's machines handle stock. The lumber conveyors are made of all steel ball-bearing rollers, eight-foot sections, easily coupled together and assembled to form a line of any required length, over which lumber, flooring, and dimension stuff will travel on a four per cent grade. Adjustable jacks are supplied to support the conveyor line and secure proper grade. The company also make a ball-bearing wheel type of conveyor especially designed for conveying shingles. Manufacturers of boxes, staves, headings, shooks, etc., will find the Mathews Gravity Conveyor a very profitable device for handling their finished product.

An Important Crane Contract

George Anderson & Company, Limited, of Carnoustie, Scotland, the parent firm of George Anderson & Company of Canada, Limited, Montreal, have just been successful in securing two very large contracts. The first, for eleven wharf cranes for the Port Commissioners of Calcutta, India, was secured in the face of strong competition with all the leading crane makers of Great Britain and Europe. The firm, who have supplied cranes of all types all over the world, send only the ironwork to foreign countries, the lumber being supplied at the site, thus reducing the freight charges to a minimum. The second contract, which was also secured in the face of very strenuous competition, is for eight large gas engines and suction gas plants for the Hirosima irrigation scheme in Japan. These engines are designed for continuous running on a very small quantity of fuel which, in this case, is charcoal. George Anderson & Company of Canada, Limited, are making a specialty of this class of machinery, for the lumber trade.

An Important Logging Device

The Barienger Braking Device as manufactured by Ryther & Pringle Company, of Carthage, N.Y., has proven itself of great benefit to lumbermen operating in rough and hilly country. This device does away with the old-fashioned snub lines and all necessity for using hay or sand on steep hills when hauling in the winter time. By the use of this device it is possible to build roads much steeper and in consequence much shorter and straighter than heretofore and the use of this brake insures against the danger of sluicing a load on a hill with disastrous and oftentimes fatal results to both team and driver. These brakes were used last winter in the Dominion by the J. H. MacDonald Lumber Company, Blind River, Ontario, Gillies Bros., Braeside, Ontario, and John Fenderson & Company, Inc., Sayabec, P.Q.

The Simplex Roller Die Swage

A new and useful tool known as the Simplex Roller Die Swage has been designed for use in small and medium, as well as large saw, planing, stave, box board and other wood working plants and factories, for the swaging of all saws used for cutting with the grain of wood such as: band saws, 3 to 20-in. wide, circular saws, 12-in. to 76-in. diameter, gang saws, all sizes, cylinder saws, 13 to 36-in. diameter, all varying in gauge from 5 to 21 (English standard gauge) which are intended to cut with the grain of the wood, of any space of teeth from 1½ ins. to 6 ins. from point to point.

The Peter Gerlach Company, Cleveland, Ohio, manufacturers of the simplex roller die swage state that it is a well known fact that

Sawing Machinery

There are several sizes of **iron saw frames,** furnished with or without top saw, one of which will interest you.

They are all of unit construction; the base being made in a single casting; for which reason they "stand up" and maintain their alignment.

Long's "Quality" Carriages were the first saw mill machines built by the Company. They were the machines that earned the reputation for dependability in service, that has placed "Long" Machinery in it's present enviable position, at the head in it's class. There is a "Long" carriage, in a weight, and at a price, to suit every purchaser. Catalog 100 describes each one in detail.

saw teeth which work to the best advantage upon all kinds of woods, grown in America, whether, frozen, green or dry, should have an angle of 45 degrees at their cutting point. The Simplex swage, swages such teeth, or in fact teeth of any angle from 35 to 50 degrees if required; although the 45 degree angle is considered the best. This universal feature should commend the simplex swage to all mill men, whether operating in a large or a small way.

These swages are mechanically perfect, strong and true, and each part is made of the finest quality of steel. All wearing parts such as roller dies, anvils, screws, nuts, washers and their seats are hardened, and tempered, and every part is standardized or made interchangeable. The tool is very easily adjusted by any filer of ordinary intelligence, yet the swage is safeguarded against the smashing of roller dies and anvil by limiting the throw of the swaging lever.

This swage has been thoroughly tested for a year on all saws for which it is being recommended, by some of the most experienced filers, who report that it has fulfilled every requirement.

Those who are interested in swages will be serving their own interests by sending to the Peter Gerlach Company, Cleveland, Ohio, for a copy of the new Simplex list.

Shurly-Dietrich Company Ready for the Trade

The Shurly-Dietrich Company, Limited, Galt, Ont., manufacturers of the widely known Maple Leaf Saws have rebuilt their factory on an improved plan and have equipped it with the latest and most up-to-date machinery. They are now in a position to meet all demands for their products.

In addition to the Vancouver branch, they have established a branch at Hull, Que., on Montcalm street, adjoining the factory of H. Walters, Sons & Company. At this branch they will do repairing, and carry a stock of circular, band and cross-cut saws, also inserted teeth, bits, shanks, etc., for the convenience of their eastern customers.

Mr. H. E. James, Ottawa, will have charge of the sales department, and Mr. Frazer, late manager of the Standard Saw Works, Ottawa, will have charge of the repairing department of this branch.

Ryther & Pringle Company's Products Popular

Ryther and Pringle Company, Carthage, N.Y., during the present season have furnished a number of their slashers, swing saws and other devices incident to the reduction of long logs to short uniform lengths for pulp wood, to leading Canadian concerns. Among the plants equipped with this class of machinery by Ryther & Pringle Company have been the North Shore Power, Railway and Navigation Company of Clarke City, P.Q., The Donnacona Paper Company, Donnocona, P.Q., The Baie St. Paul Lumber Company, Baie St. Paul, P.Q., and the Abitibi Power & Paper Company, of Iroquois Falls, Ontario. Ryther & Pringle Company have made an exclusive specialty of this class of machinery for a number of years and their equipment has found a place in the great majority of the leading pulp mills in the Dominion as well as the United States.

A Unique Trade Booklet

"How The Chief Engineer Was Convinced" is the title of a booklet just published by the B. F. Sturtevant Company of Canada, Limited, Galt, Ontario, describing a visit of a prominent engineer to their works. It deals particularly with the manufacture of the company's turbines and tells and illustrates how each part of the machine is made, tested and finished. Copies will be sent on request.

A Valuable Food for Camp Horses

One of the most important assets of the lumber trade in camp operations, is the quality of the horses which play such an important part in the work of every camp. It is necessary to secure the best stock in heavy draft horses and after that it is necessary to keep them in good working condition. Heretofore the trade has suffered heavily by the loss of these animals, many dying in the isolated places where no veterinary was available. This was due largely to colic, indigestion and other similar maladies, the chief causes of which were found to be over work and over feeding. Of late, however, by the substitution of a portion of molasses meal for a portion of the usual ration the mortality has been reduced considerably.

One of the most successful meals of this nature on the market is the Caldwell Molasses Meal, manufactured by the Caldwell Feed Company, Limited, of Dundas, Ont. Caldwell's Molasses Meal has now become the standard supplementary Feeding Meal of the Dominion. It is not only highly nutritious itself, but it increases the value of the rest of the food at least 25 per cent. It is sold under Government guarantee to contain at least 80 per cent pure cane molasses. It is dry to the touch, of a pleasant odor, easily digested and most palatable.

It is manufactured in a large and up-to-date mill giving a maximum output of over 80 tons of molasses meal every twenty-four hours, the whole plant forming what is perhaps the largest and most modernly equipped mill for the manufacture of feeding meals to be found in the Dominion.

Caldwell's Molasses Meal is now used by the leading firms of the Dominion, who have found it most satisfactory.

Free Consultation for Lumber Horse Owners

The National Stock Food Company, Limited, of Montreal, who are catering to the lumber camp's veterinary needs in stock food and drugs, are offering to the trade free consultation by letter with their experienced veterinaries in charge of Dr. A. I. Telmoose, of Ottawa, one of the leading veterinary surgeons of that locality. Special forms are sent on request which, when properly filled out and mailed by the owner of the horses, will give by return mail a correct diagnosis of the ailments from which their animals are suffering. This should prove particularly useful to lumbermen in isolated places. The company was incorporated in April of this year with a capital of $100,000 and its directors are A. A. Mondou, M.P., president; J. A. Barrett, M.P., vice-president, and Dr. A. I. Telmosse, of Ottawa, manager.

Acadian Pride Homespun Pants

In the management of woods operations there is nothing of more importance than the comfort and good natured co-operation of the lumber jacks. One of the most certain ways of securing co-operation of this nature, is by handling, in the camp store, only the most suitable of all kinds of materials, which are sold to the men. Employees who feel that they are getting the best possible value for their hard-earned money are certain to give in return for their wages the best service they can.

In these days when labor and costs are so high, such a matter is of the utmost importance. None of the stocks carried in a camp store are of more importance than clothing. Upon it depends, to a very great extent the comfort and the working ability of the men.

Messrs. Clayton & Sons, wholesale clothiers, Halifax, N.S., have long ago realized the truth of this statement, and have done a great deal towards simplifying the clothing problem in the lumber camps, by the production of the "Acadian Pride Homespun Pants." A fuil page advertisement of their goods will be found elsewhere in this issue, and by reading this advertisement, logging operators will see at a glance, many of the attractive features of these goods. Acadian Pride Homespun is particularly adapted for the hard usage which logging employees give to all their clothes. The seams are sewn with four-cord thread, strong bar tacking is used to strengthen all the pockets. The material is thoroughly mill shrunk before being made up.

There are many other important advantages, which will appeal to all who work in the camps, and we would advise our readers, who are interested in these goods to get into touch with Messrs. Clayton & Sons without delay.

Running on Full Time

Editor Canada Lumberman: New York, Aug. 3.

Our saw shop has been running practically on full time right along, to supply our customers both in the United States and Canada with genuine Hoe chisel-tooth saws, bits and shanks, and while the present conditions in this country and abroad make the immediate outlook somewhat uncertain, we have every confidence that the lumber business is likely to be more active in the near future in accord with the opinion and expectations of many lumber manufacturers.—R. Hoe & Company.

Have Had a Good Year

Editor Canada Lumberman: Orillia, Ont., August 3.

We are glad to advise you that, taking into consideration the conditions of business in general throughout the country, we are well satisfied with the volume of business done during the past year.

Owing to the unsettled conditions throughout Europe at the present time, we think it would be useless to give any forecast of the prospects for business in our particular line.—The E. Long Mfg. Co.

Orders Ahead for September

Editor Canada Lumberman: Duluth, Minn., Aug. 3.

We find conditions especially good at the time of writing in our logging machinery department. In this department, we have orders ahead to keep us running continuously until almost the end of September, but, of course, we are perfectly willing to put on a double shift if necessary.—Clyde Iron Works.

Editor Canada Lumberman: Saginaw, Mich., Aug. 3.

Our business during the past year, has been unusually satisfactory, and the volume has exceeded the business done previously in two years put together.—William B. Mershon & Company.

Review of Current Trade Conditions

Ontario

Lumber trade conditions in Ontario are affected so greatly to-day by the sudden commencement of war in Europe that it would be difficult to say just what the actual situation is. Midsummer dullness has been in effect for some weeks already, and it is a question whether the quietness which now prevails, is so much the result of the war, as many lumbermen seem to believe. The fall trade will probably remove this doubt in the course of time. Unquestionably there is to-day a great quietness in the trade. Travellers report that they are met everywhere with the same remark, to the effect that everything looks so doubtful that no orders can be given. The actual volume of trade to-day is probably less than it has been for many years. Building operations have been affected by the scarcity of money. New buildings are not being projected to any extent, and many of those in the course of construction have been temporarily interrupted for want of funds. The demand according to retailers' reports, is largely for material for repairs, etc., and this only makes sufficient trade to keep a small amount of stock in movement. Retailers are buying very little, waiting to see how matters will develop. Manufacturers are in the dark regarding the outlook for next year, and are considering whether they will curtail their operations. High prices of provisions may more than off-set the reduced cost of labor and render it unwise, in some cases, to put many men into the bush next winter. Some manufacturers have almost decided already to reduce their winter's operations greatly, but others are still in doubt, or because of peculiar local conditions, are committed in advance to fairly heavy production.

The export trade at Ottawa has been brought to a standstill, by the war situation. Trade in general has slumped since the opening of the war. Building operations have come to a stop, as they are crippled by the scarcity of money. Ottawa operators are considering the advisability of reducing their woods operations next winter. J. R. Booth who intended to send 3,500 or 4,000 men into the bush, will probably only send about 1,000, unless the war suddenly comes to an end. Other large manufacturers will only operate as many camps as are absolutely necessary. Food stuffs and horse feed have already advanced in price, and further advances are expected.

Eastern Canada

Reports from St. John, N.B., indicate that the local lumber trade during the past month has been quite active, and that the activity has been fairly well maintained. The improvement developed before the war, and it is difficult to say whether it will continue or not. The export trade will depend very largely upon whether the trade lanes upon the ocean are kept open. Local prices continue firm at St. John. Merchantable spruce boards selling at $16.00 at the mills. Refuse stocks are light and the prices are about $11.00 at the mills. Low grade boards are scarce. Stocks of English deals have been reduced considerably during the past fortnight. If the war continues, English deals are likely to be stored on the wharves at St. John. The English demand was showing improvement up to the opening of the war, and if stocks could be shipped now, they would probably bring good prices. Manufacturers are hoping to be able to make shipments soon. No improvement is yet reported in the American market. The demand for random cargoes is poor. Stocks averaging about 15 feet are in fair demand and are more profitable, selling at about $16 per M., f.o.b. St. John, for 2-inch stock with a small portion of 4-inch. The demand for lath continues good at a rate of $3 per M. on the wharves, or at the mills. Unsold stocks are scarce. All the logs in the St. John River are now in the booms, and about half of them are rafted. The total amount passing through the booms this year, will probably be a little over 50,000 feet. Lumbermen are waiting until the war situation clears before arranging their plans for logging next winter.

The lumber trade at Montreal is suffering similarly to that of other important Canadian points, on account of the war situation. No great decrease has occurred, but a feeling of uncertainty has prevented local dealers from buying to the usual extent, and unless the situation improves, trade is expected to decline considerably. A good deal of difference of opinion is expressed as to the ultimate effect of the war upon the lumber trade. It is thought at present that building operations will not be greatly disturbed. The export market to Great Britain has felt the effect of the war considerably. Stocks in Great Britain are large, but will not last very long, as it is difficult to secure fresh supplies from the Baltic. This may have a good effect upon the demand for Canadian pine.

Firmer prices are reported for spruce at Boston. Some of the larger dealers are holding out for $23.50 base. Some business is still taking place at $23, however. Improvement is also reported in random. Quotations being as follows: 2/3, $20.50 to $21; 2/4, $21.50 to $22; 2/5, 2/6, 2/7, $20 to $21; 2/8, $22 to $22.50; 2/10, $23.50 to $24; 2/12, $24 to $24.50. The market for spruce covering boards is quiet. There is a fairly steady demand for lath at Boston, but prices are a little easier. Most of the transactions being at about $4.05 for 1⅝ in. Some mill men, however, are refusing bids of less than $4.10. On the other hand there are a few sales at $4.00. The inquiry for 1½ in. lath is moderate and quotations are from $3.70 to $3.90. Shingles are firmer and the demand is improving. The best makes of white cedar extras are being held at $3.60, Clears are offered at $2.85 to $3.10 and second clears at $2.60 to $2.70. B. C. extras are quoted at $3.55 to $3.75 and Washington makes at $3.45 to $3.70.

United States

The war has had an unsettling influence upon United States trade conditions in general. In the lumber business, however, a decided tendency toward improvement is noticeable. Manufacturers are expecting a much heavier trade during the fall. Reports from many parts of the country indicate a greater inquiry for stocks. Southern pine mills continue to hold their stocks at fairly firm prices. The Pacific Coast mills are holding firm to the recent advances of $1.00 per thousand.

The hardwood markets are more hopeful than they were recently and manufacturers are producing extensively in anticipation of good business. Northern hardwood is particularly firm. Northern pine and hemlock are a little firmer, but there is not much activity in buying at present as farmers are busy in the field. A better demand for these woods is expected a little later on. The demand for Northern pine at Buffalo is still small so far as the better grades are concerned. Prices are well maintained as a whole, but are low. The box factory trade is quiet but low grade stocks are scarce and prices are firm. Better business is reported in Northern pine from North Tonawanda. Dealers report a general improvement in the demand. No surplus of the lower grades has developed. A steady sale is reported for hemlock at Buffalo, and prices are on a fairly firm basis. Stocks offered, however, are plentiful. The hemlock market at North Tonawanda is not active but dealers are expecting improvements in the early fall.

Great Britain

The war situation in Great Britain has overshadowed all other considerations and naturally has had an effect upon the lumber trade. Up to the latest reports, however, a fairly good business has been in progress. London spot prices, except for deals, are quite good, and for prompt parcels on c.i.f. or "ex-ship" terms there are many inquiries, but very few sellers. The rise in freight of from three to four shillings per standard from the Baltic has assisted spot prices, and has tended to depress f.o.b. figures. London firms report having made important contracts for White Sea goods the figures varying from 10 to 20 shillings per standard lower than those which were at first asked by the shipper. The inference is that shippers have been greatly affected by the general nervousness, which has developed out of the war.

The slight improvement that was noticeable at Liverpool and Manchester recently has been suddenly checked by the war situation. Spruce continues to find a quiet market and is expected to do so for some time yet. Spruce deals at Glasgow seem to be hanging fire to some extent, the demand having been very disappointing for a long time. Riga stock is taking the place of spruce to a large extent. Arrivals from Montreal have made up most of the recent Glasgow imports and have consisted chiefly of birch planks, and third pine deals.

Plenty of Men for the Camps

Owing to the scarcity of work in the cities there is a very large supply of men available for bush work this year, and the labor bureaus have received an immense number of applications. Many gangs have already been sent to the various camps in Ontario and Quebec. One feature is the unusually large number of French Canadians who are seeking work in the bush. There is every reason to believe that the wages to be paid will be in most cases on a lower scale. The Quebec Provincial Employment Bureau, Montreal, commenced last year to send men to the lumber camps, and this season has received increased applications from men anxious to go to the camps. Mr. F. Payette, the manager, has visited several of the larger camps in the province.

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

St. John Trade Active—War Effect Doubtful

St. John, N.B., August 4th; (Special to the Canada Lumberman): Locally, the lumber trade has been good, and sharp trade has taken place during the past month, and at present writing there has not been any great cessation, but what the arising war clouds may do remains to be seen. Of course, if anything extraordinary happens it will be the means of making people move very cautionsly, but, should the trade lanes be kept open and exchange of money be facilitated, probably business with us will be as good, if not better than of late, in as far as the foreign business is concerned.

Prices for local lumber remain firm. Merchantable spruce boards are quoted at $16 at the mills and clear spruce boards at $25 per M. at mills, but a very limited quantity can be had as the logs only produce a very small percentage. Stocks of refuse at the local mills are not heavy and are pretty well purchased, the price being about $11 per M. at mills. Very few low grade boards are on hand as they are used about as fast as made. The same also applies to 2 x 3, 2 x 4, 3 x 4, the only stock beingin 3 x 5 and up deals.

Stocks of English deals at the mills are not heavy as a good many steamers have been loaded during the past two weeks by Messrs. Moore, Mackay and McKean, but it is expected that should the war continue all deals manufactured from the present onwards will be stored on the wharves here unless certain arrangements can be made with the governments for protection in transporting. No prices can be made on deals from this market at present. In fact, all the cuts are sold and no deals are coming forward unsold. Business in England was fair up to time of opening of war, and some shippers feel that if they could ship over the stock, they could probably get good prices. Probably the next two weeks will decide what can be done towards getting the lumber across and also what demand there will be for lumber. A steamer carrying about 3,000,000 feet just left port today for Glasgow, with an order, and whether she will get through safely remains to be seen.

In the American market the improvement looked for has not taken place, although some buyers differ in their opinion, according to the location of their yards, or the district in which they are doing business. For long random cargoes from St. John the prices which can be had are unprofitable, as the logs from which the long average stocks are sawn are costing about as much as the stock brings after being manufactured, but taking stock which averages about 15 feet or thereabouts the prices are much better in comparison and are bringing the shipper about $16 per M. f.o.b. St. John for random two inch with a small portion of 4 inch, largely 4 x 6.

Laths remain firm and are well shipped up, a good portion of the laths shipped from here this year have been sent to Philadelphia by steamer and have left the shipper a little better than $3 per M. on wharves, or at mill. Many inquiries are coming in for laths, but very few are unsold at present.

Pine of shipper quality is being purchased at about $25 per M. for the large boards, 8 inch and up wide, 10 feet contents and up and $17.50 for the smaller size boards under 10 feet contents. These do not contain any fourth quality or refuse boards. Clear pine is scarce and what there is cannot be purchased for less than about $45 per M. for small boards and $60 per M. for the larger boards.

Hemlock plank and deals are selling at from $12 to $15 per M. according to quality with boards planed one side at about $16 per M. Stocks are light and spruce is being largely used for boarding in purposes.

Shingles remain quiet and no improvement is looked for. Prices remain unchanged.

Freights for England are now out of the question, as no vessels can be had until the government is supplied with transports, after which, if satisfactory arrangements can be made in reference to risk, etc., no doubt vessels will be offering. Until then probably no shipments will be made.

Coastwise freights are very low and many vessels have tied up rather than accept the low rates offered to New York, being about $2.75 per M., at which price the owners claim they cannot pay their bills.

What effect the war will have upon the American market it is impossible to forecast. While some think that it will make an improvement, others do not.

The St. John River Log Driving Company now have all the logs on the booms and the river is clear from Grand Falls to the booms. Twenty-eight million feet of logs have been rafted to August 1st, this being a little over half the total quantity. It is expected that work at the booms will be finished early in September. The new system of rafting is proving very successful both in saving in rafting expenses, lessening the destruction of the log in boring and pinning as in the old way, and being a benefit in handling at the St. John end. A still further improvement can be made for another season in making a slight change in the layout of sorting works, which will facilitate faster work.

No arrangements for cutting logs for 1915 have been yet made and absolutely nothing will be done until after the lumbermen can see their way clear about the outcome of the war and its affect on the markets.

Montreal Trade Holding Up Fairly Well

Montreal, August 12th (Special to the Canada Lumberman): Since the last report, conditions have undergone a lightning change. No one imagined that within such a short period the long dreaded European war would be a fact and that general markets would be upset in such a marked degree. So far lumber business has not declined to any great extent—although naturally orders are coming in slowly—but there is a feeling of uncertainty which prevents local dealers especially from buying on a normal scale. They are nervous as to future developments, and therefore are acting in a very cautious manner. This is a mere matter of precaution. All the wholesalers have not been affected as yet, and here and there firms report a fairly satisfactory amount of trade, having regard to the general conditions which have prevailed this season. As a matter of fact, while it is generally agreed that the market will be adversely influenced, there is a great divergence of opinion as to how far the lumber industry will feel the effects of the European struggle.

Building of houses and flats continues to be a feature, but some of the larger structures are being held up in consequence of the outlook. Many prominent contractors, however, express the belief that, on the whole, the building business will not be materially disturbed.

Prices of spruce are holding up, while the better grades of pine continue weak in value and slow of sale.

Exports to Great Britain have naturally suffered from the war conditions. A fair amount of lumber has just been sent. One or two firms have stopped shipments, and if there is no improvement in the situation, it is very probable there will be a further diminution in the exports. Stocks in Great Britain are large, but, these are certain to be depleted owing to the impossibility of obtaining supplies from the Baltic, and a better demand for Canadian pine may arise, although there is the possible difficulty of obtaining freight room to be reckoned with. The insurance rates on lumber have advanced 20 per cent.

The pulp and paper markets are strongly influenced by the war. All exports from Europe to Canada and the United States are stopped, and Canadian manufacturers will not be able to supply the demand, particularly of sulphite. Under these circumstances prices have taken a sharp upward turn.

Ground wood quotations have advanced in sympathy, and there is certain to be a shortage of this pulp.

The consumption of news print has greatly increased—one Canadian daily is buying 50 per cent more than the normal quantity, and prices have stiffened. The Laurentide Company, Grand Mere, is running to its full capacity, and has declined to fill export orders from South Africa, Australia, and New Zealand until there is more certainty as to the freight position.

Ottawa Trade Feels Effects of War Situation

Ottawa, August 7th (Special to the Canada Lumberman): The all absorbing topic of interest with the lumberman just now is what will be the effect of the war in Europe, if it is prolonged for any length of time. Already the export trade has been brought to a standstill owing to the danger of British vessels being attacked by German vessels on the Atlantic. Yesterday Watson and Todd, or rather their representatives here, informed the Canada Lumberman that shipping companies had given notice that they would take lumber aboard at Montreal, but would not promise when it would be delivered. Insurance rates have jumped from one and one and half per cent to three and five per cent. The outlook at present is not very encouraging and indications are that business will be crippled for sometime, unless

Better Hurry

If you are going to need stock this Fall.

The Railroads claim there will be the worst car shortage in the history of railroading—due to the tremendous grain crop and their shortage of equipment to move it.

We can take care of you now but can promise nothing later.

Remember ours is the best value in Dressed Spruce on the market to day, not the leas dollars per thousand feet, but the fullest measure per dollar spent.

Dry stock—prompt shipment (now only) smoothest dressing—best grades.

the war ends quickly, or the British win some decisive victory on the sea that will enable merchant ships to ply between Canada and England without danger.

The export business is not the only branch of the trade that will be affected by the war. Trade for several months past has not been brisk and in the last few days it has taken a bad slump. People who contemplated building have postponed their plans owing to the state of the money market with the result that building does not show signs of going ahead.

A few weeks ago the wholesale lumbermen figured on sending more men into the bush this season than they did last year, but with the prospect of foodstuffs rising to an expensive height they have changed their minds. J. R. Booth intended to send from 3,500 to 4,000 men, but unless the war comes to a close quickly he will not have more than 1,000 in the camps. W. C. Edwards Company, Shepard and Morse and all the large firms in the Ottawa Valley will not operate any more camps than are absolutely necessary. Foodstuffs and horse feed have already risen to some extent this week and provision merchants predict more increases are inevitable shortly.

There have been no alterations in prices lately nor are there likely to be, as the demand will no doubt fall off.

A factor that will help to make the total cut in the Ottawa Valley considerably less this year than it was last is the breakdown that occurred at the sawmills of Shepard and Morse last Tuesday, when a connecting rod on the driving engine broke and caused the engine to be completely wrecked. The head of the cylinder blew out and came near doing more serious damage than blowing out the end of the engine shed. This accident will cause the mill to be closed down for two weeks and during that time 125 men will be idle. The firm will install an electric motor until a new steam engine is installed. Add to the two weeks idleness of the Shepard and Morse mill the tie up for five week's of J. R. Booth's plant through the breaking of a flume wall at the latter part of June and the inconvenience caused to several mills throughout this district owing to the lack of water in the driveways and it will be readily understood that this year's cut will be a good many million feet less than last year.

The fire which broke out in Gilmour and Hughson's yards at Hull, Que., last week destroyed about 7,000,000 feet of various grades of pine, mostly middle grades, valued at approximately $200,000. Of the 7,000,000 feet burned about 4,000,000 was owned by Hughson and Company, of Albany, N.Y., and the balance by Gilmour and Hughson. Thomas Mackarell lost about 25,000 feet. The total loss is covered by insurance. The cause of the fire is not known, but it is believed that it was due to someone throwing a lighted match or cigarette on some inflammable material in the yard as he pasesd by.

Canada's Resources Shown at C. N. E.

The display of Canada's natural resources in the Government Building at the Canadian National Exhibition, Toronto, is the most complete ever got together. The Dominion Government is sending a complete exhibit of the fish that swim in the Atlantic, the Pacific and the streams that flow between. Ontario is showing her grains, her fruits and her minerals; British Columbia is sending her timber, her fruit and her grains, the Prairie Provinces are showing their grains and the Maritime Provinces their minerals. If you are a Canadian the display will make you proud. If you are a visitor it will interest and amaze you.

Argentine Lumber Imports

The total value of Argentina's importation of the classes of lumber included under the heading of white pine, spruce pine and tea pine, as given in the Argentine Government trade returns, is shown herewith:—

	1909	1911	1912	1913
	$	$	$	$
White pine	2,546,049	2,710,800	2,207,272	1,406,879
Tea pine	11,205,554	9,158,953	8,460,852	9,182,464
Spruce pine	2,887,473	3,387,659	3,823,429	2,964,094
Total	16,639,076	15,256,412	14,491,553	13,499,437

The total exports of lumber from Canada for the year 1912 (excluding laths, palings, pickets, shingles, shooks, staves and headings), amounted to $28,510,812. Argentina's total consumption of white pine, tea pine and spruce lumber therefore is equal to about half of Canada's total exports of the same classes of lumber.

The values of Canadian lumber purchased by Argentina for the period, 1908 to 1912, were as follows:—

1908	$1,577,216
1909	1,581,712
1910	2,321,290
1911	2,646,058
1912	1,724,608

Apart from the United States and the United Kingdom, Argentina would seem to be the most important foreign buyer of Canadian lumber, as the purchases of no other country reach the two million dollar mark. The amount of lumber sent to the Argentine in 1912, would be equivalent to from 20 to 30 shiploads.

Imports of Pine and Spruce

The following table shows the value of white pine, tea pine and spruce sent to Argentina from Canada, the United States, and all countries for several years. While the United States almost monopolizes the business in tea pine, Canada has been able to export spruce and white pine in quantities which almost equal those sent by the United States.

Imports of White Pine

	1909	1911	1912	1913
Canada	578,442	1,094,995	194,940	
U. S. A.	1,811,889	1,509,729	1,791,140	
All Countries	2,546,049	2,710,800	2,207,272	1,406,879

Imports of Tea Pine

	1909	1911	1912	1913
Canada	205,622	309,610	45,312	
U. S. A.	10,885,533	8,739,188	8,371,600	
All Countries	11,205,554	9,158,953	8,460,852	9,128,464

Imports of Spruce Pine

	1909	1911	1912	1913
Canada	797,648	1,241,422	1,484,350	
U. S. A.	1,776,404	1,509,526	1,722,336	
All Countries	2,887,473	3,387,659	3,823,429	2,964,094

Falling Off in Demand

The first table of this report shows that the demand for lumber has not increased during the past five years, but rather that the opposite has taken plase. A great part of the lumber imported is uesd in building operations and on railway works. The period 1909 to 1912 was remarkable for activity in the building trade. The present economical depression, however, having seriously affected the building trade is doubtless the reason for the falling off in the imports.

It is not expected in local shipping and commercial circles that the opening of the canal will have any appreciable effect on British Columbia's trade with the Argentine. The distance from Vancouver to Buenos Aires via Cape Horn is some 8,336 knots; via the canal it will be slightly more.

While it is true that insurance rates on lumber cargoes passing through the Magellan Straits are rather heavy, the dues to be levied on shipping passing through the canal will probably counterbalance these. It is not therefore likely that the opening of the Panama Canal will, in itself, have much influence on the local market for British Columbia lumber.

Charter rates vary so much that it is difficult to make comparison. Rates from gulf ports are, of course, lower than rates from northern ports, but no spruce is shipped from the gulf ports. British Columbia spruce and Douglas fir shippers, however, have to compete against New York and St. Lawrence river shippers. Information was obtained that 120 sh. to 180 sh. per standard, of 1,980 feet from Puget Sound, ruled some two years ago, but it is difficult to obtain exact information regarding rates from the St. Lawrence river. These rates are arranged in London and rarely, if ever, in Buenos Aires.

Notes on Argentine Lumber Trade

Pitch pine comes from the gulf ports and is the stable timber used in the country for all classes of construction work, the better classes being used for floorings, camp furniture and rural buildings.

Spruce is used for light, cheap work, and comes mostly from Quebec, and Nova Scotia. A small amount comes from Norway and Sweden.

White pine is used for all joinery work, doors, windows, etc., and also for inside furniture.

Nearly the whole of the lumber importing business is in the hands of ten or twelve large firms. These firms make their purchases through New York (and sometimes London) brokers.

The rules for grading adhered to are those published by the respective lumber companies.

Arbitration is held usually at the Buenos Aires "Bolsa de Comercio," a representative of each party and a third, nominated by the Bolsa, constituting the Board.

Payment is usually made in London at 90 to 180 days acceptance against shipping documents.

West coast lumber has little sale in the Argentine Republic. A large importer who took up the question of British Columbia lumber some years ago, reports as follows:—

"On account of the climate the timber soon rots. The only big shipments that have come from the west coast were made in the period 1904 to 1907, and again in 1912, when some 6,500,000 feet were brought down for cattle fittings."

Fancy Woods and Veneers

THEIR ORIGIN, VALUE AND USE—COMMENT AND VIEWS ON AN IMPORTANT BRANCH OF THE TRADE.

The Sawed Veneer Industry

The development of rotary and sliced veneer has been so prominent in recent years that the sawing branch of the industry, though one of the oldest, has been overshadowed and might be presumed to have been losing ground, says C. R. O. in Hardwood Record. It is not losing, however, for sawed veneer today is the best product of all in point of quality because it is absolutely free from the rupturing of the grain caused at times in cutting, and when finished is in appearance and fact the same as solid lumber.

The saw was one of the first veneer making machines. Brunell, who is really the father of the present-day industry, invented the first veneer saws and installed a plant in the suburbs of London some time between 1800 and 1805. At that time he had segment saws of large size. One description gives them as nine feet in diameter. He sawed veneer from rosewood and mahogany logs or flitches and produced substantially the same kind of a product that we have today. It was veneer of this class that entered the fine cabinet work of that period and later was used in making fine pianos and cabinet work in this country.

Slicing was developed about the same time, and then came the rotary veneer machine, which has in some respects overshadowed other branches of the industry, especially in quantity. However, while the rotary machine has been doing big things in the way of quantity and while the slicing of veneer has continued to develop both in mahnitude and quality, the sawing of veneer has also steadily progressed.

It is difficult to get at the exact relative sizes of the different branches of the veneer industry. The Forest Service, which collects statistics and makes reports on the industry yearly, does not always give separate figures for the different kinds. In 1909 this work was done by the Bureau of the Census, and more specific details were given. In the report for that year the three processes of veneer making were mentioned. By the rotary cutting process 85.2 per cent. of the logs were cut in 1908, and 87.7 per cent. in 1909. Taking the twelve principal domestic woods in the point of quantity, about 90 per cent. of them were cut on the rotary machine, but in the matter of red gum, the leading wood, 95 per cent. was rotary cut, and perhaps the same holds true as to cottonwood, birch and basswood. Sixty-five per cent. of the oak made into veneer was either sawed or sliced, and of the mahogany 49 per cent.

During the census year 1909, 45,042,000 feet of flitches and logs were worked into veneer by sawing and slicing, but there are no figures to show just how much of this was sawed and how much was sliced. Veneer mills are sometimes operated in connection with sawmills and sometimes separately.

The standard thickness in quartered oak and veneer runs from 1/20 to 1/16 inch. This of itself explains the necessity for more accuracy and finer manipulation than obtains in any ordinary sawmill. Just a little shake, or shifting of the carriage, or a little crowding endways of the saw mandrel, and a 1/20 inch board will be cut in two in a twinkling. End play must be guarded against in both carriage and saw mandrel; the saw must run true and be very lightly and evenly set. It must be kept filed keen and not crowded in its work. And, of course, the blades must be made as thin as practicable to reduce the waste in sawdust. That is why they are made in segments and mounted on discs, and even the segments are ground tapering so that the cutting points are as thin as it is practicable to run them.

While the quartered oak business has always been the most prominent feature of sawed veneer, there is apparently an opportunity to use veneer saws in connection with sawmilling operations to do a much greater amount in plain sawing than has been done heretofore. The veneer saw is a good machine with which to make thin oak for panel stock. There is other plain sawing that may have more possibilities than have been developed. The writer recalls a mill he visited several years ago where thin poplar lumber was being made with veneer saws, the mill saw simply flitching the logs and the veneer saws making them into thin lumber, which was a smoother product than would have been made on the mill saws and was made with less loss in kerf.

This is a point where the veneer saw and the modern resaw come into pretty sharp competition. Band resaws are made which take a very light kerf; and when they are in skilled hands and are kept up properly, they do remarkably good work and, as a rule, do it at greater speed than is customary on veneer saws.

Whether one uses veneer saws or resaws in making thin lumber, the stock should be sawed green. No process of treatment is required to prepare timber for sawing on the veneer machine. It is taken fresh from the sawmill and work on it commenced. If it is laid aside, however, and allowed to dry, it causes face-checks and these injure the first sheet or two. It is found, also, that veneer from partly seasoned flitch will warp and check more than that from green lumber because it has partly dried out and a multitude of strains have been set up in the timber.

If flitches can not be worked up immediately and must be carried in stock, one should have sheds to protect them from the sun. The best way is to operate a veneer mill in connection with a sawmill, or reverse the order and have a sawmill to do the flitching for the veneer mill so that the raw material can be purchased in the log and flitched as needed.

There are sawed veneer plants, however, operating successfully which buy flitches instead of logs, which reduces the amount of capital required for the original equipment, but increases somewhat the necessity for care and watchfulness in buying raw materials to have enough coming all the time to run steadily and yet not get an accumulation that will dry out and deteriorate before using.

Japanese Oak

There is practically only one kind of wood exported in any large quantity from Japan to Europe, viz., oak, says The Timber Trades Journal. Without having visited the Land of the Rising Sun it is difficult for those in Western Europe to form any mind-picture of its vast timber resources. To commence with, it possesses a fertile soil and humid climate, except in winter, when the northern portion, called the Hokkaido district, usually experiences severe frost and heavy snow. The forests of Japan cover 74 per cent. of the total area of the country, a fact which explains why such a small country, as "Westerners" like to think it, can not only supply its own timber requirements, but is able to export large quantities also. It is quite clear that its resources are not being undermined, becaust the latest statistical return gives an area of over 86,000 squaer miles of growiug timber. Rigid forestry laws are in force to conserve and protect existing forests, and at the same time attend to reafforestation. In the latter case the State gives young trees to the people where necessary. The forest products are many, but at present "Jap" oak is the only one to be touched upon in this article. It grows in the Hokkaido district above referred to, and mainly on the highlands and in the mountainous districts. This portion of Japan covers an area of about 30,500 square miles, and is indeed more thickly wooded than that further south. Incidentally it is between the same latitudes and similar in altitude to the forests of Austria and Virginia.

Japanese oak has been known on the European market for the past six years. At first it was subject to much suspicion, without any good reasons. Jealousy on the part of the sellers of other kinds of oak, who possibly did not like to see their market interfered with by any "outsider," was to some extent responsible. Those who shipped the "pioneer" parcels were also to blame, because much of the wood had not been felled at the proper time of the year, and for other reasons was not in shipping condition, consequently the "first impressions," which should have been favorable, as far as the wood itself is concerned, were in some cases the very reverse. Then, again, too much was claimed by its votaries; users looked for a degree of excellence built up by big claims on its behalf, and of necessity were disappointed. In this way the hands of the clock were "set back" on a wood of undoubted merit and great beauty. Mention must also be made of the idea that gained currency that the Japs were exporting the wood because of its inherent defects. Considerable color was given to such a libel by the undue haste made at the outset in sending much larger quantities than the market could conveniently digest. This has in a large measure been remedied, but much time must necessarily elapse before the errors of the past are removed. Of late solid progress has been made, and it now only requires intelligent handling, and not too heavy supplies, to put this magnificent wood in the proud position it is destined to fill in the civilized world. To do this, however, the greatest possible care must be exercised, and in this connection it is only fair to say that each shipment as it arrives is superior to its predecessors in quality, condition and manufacture. Shippers have lost many yen by inexperience, and the Japanese are the wrong people to perpetrate anything which would bring them less than they might otherwise get for their wares. Some little difficulty has been met with at times in seasoning the logs after sawing, owing

to cracks and shakes developing; experience is required to season the wood properly. The best results are obtained by skidding the logs as cut in a cool place, or where they are not fully exposed to the direct light of the sun.

Up to the present most of the wood has been imported in the form of hewn logs. There have been a number of flitches or billets free of heart, also a limited quantity of staves. The logs show the "dog" marks made by the spiked bars used in handling up to the time of shipment. These do not improve the appearance, and are certainly in excess of what is experienced with any other kind of log timber, but are easily removed when taking off the slab. In the matter of quality present shipments leave little to be desired; the average length is short, but this is not a serious drawback. Emphasis should be laid on the good average depths obtainable, and in this respect it has no compeer. In color and texture it is well up to the best qualities of other kinds of oak, but it has less density, or "body," as it is termed. In other words, it is lighter bulk for bulk, but when finished by the cabinet-maker it is frequently mistaken for other varieties of a heavier description. It is without question splendidly adapted for all interior and decorative work. Whether it is better than this or that kind of oak matters little; the point of most importance is that as the wood gets known and better understood by present users it will win devotees in every direction. No wood ever set out to win popular favor with a better chance of success by sheer merit than "Jap" oak, despite obstacles of all kinds.

A New Form of Milk for Camp Use

Recently milk in powder form has come into use quite largely for the requirements of lumber companies and other concerns operating camps, and has proven to be in many ways a welcome addition to the camp supplies. It is probable that, as this product becomes better known, it will be found in almost every camp.

The product most largely used is a separated milk powder made by a process recently perfected, which makes perfectly soluble powder. For tea, coffee, and so on, it is usually mixed with water and is used as the ordinary liquid milk. The manufacturers, however, do not recommend it so much for this purpose as for use in every kind of cooking where milk is ordinarily used. For cooking, the milk powder is mixed in dry with the other ingredients and where the recipe calls for milk, water is used in its place, the milk having been already supplied by the powder which has been used.

Many camp cooks have now become familiar with the use of this milk powder, and, after once becoming accustomed to it are loud in its praise. It is only the inexperienced cook who has any difficulty in its use, and a short experience of actually using the powder does away with every difficulty.

The greatest advantages to be obtained from the use of this milk powder are those of convenience, improved quality and flavor, and economy. In milk powder, the amount of water is considerably less than that of flour, and amounts to less than 2 per cent. It is evident, therefore, that so far as weight is concerned, which is often an important factor in many lumber camps, milk powder has a very important advantage. The same amount of milk value will weigh only about one-quarter as much in the form of powder as it does in other forms, and only about one-tenth as much as in the form of ordinary liquid milk.

Intense cold does not in any way injure the powdered milk, as the amount of moisture in it is so small that freezing has no effect upon it at all.

So far as economy is concerned, even aside from freight rates and transportation, this milk powder has decided advantages. The proof of this is shown in the fact that large lumber companies are buying it in increasing quantities, and many of them have informed the manufacturers that they will never again be without it for camp use.

Another great advantage of this product is that it will keep for a long time even after the can has been opened. For camp use, the milk powder is usually put up in cans containing 10 lbs. and large cans containing 50 lbs. net weight of the powder.

It is probable that the use of milk in this form will increase largely among lumbermen and that the many advantages to be obtained by using it will, before very long, result in its almost universal use. The product is no longer an experiment, but a proven success, and is guaranteed to contain no adulterations, preservatives, or chemicals of any kind. It consists of nothing except the solids of milk from which the water has been removed.

It will pay any lumber concern having camps in the bush to investigate this product as, by it, all the difficulties in supplying milk can be overcome at low cost, and a most satisfactory product can be furnished to the men in a form very convenient for the use of the camp cook. Information regarding thsee products can be secured from Canadian Milk Products Limited, Mail Building, Toronto, manufacturers of Trumilk, Milkstock, etc.

To Buyers of Camp Supplies

You will be requiring groceries for your next season's operations very soon now, and we would like very much to have an opportunity to show you what we can do—we are giving such splendid satisfaction to many buyers that it prompts us to think that we can do the same for you—for instance ask us to send you a sample of our special Camp blend. This tea is giving universal satisfaction, for it is made up to suit the users of it—the hardy river and bush men who want something that has a taste to it—not at all the same fine mellow kind that is suitable for afternoon and pink teas. Try it. It will go farther and please the men better.

Excellent value in Valencias Prunes and Evaporated Peaches—this latter is the only line that will truly take the place of Evaporated Apples of which the market is bare, and so much cheaper—just fancy a fine quality yellow meaty peach at 7½—get in on these.

Dear Sirs

Answering yours of the 16th Inst the McCaskey System has been giving us first class satisfaction and we are as you are aware adding another unit to our outfit which will bring our system up to handle 1300 accounts. We can handle our accounts easier this way than by any other system we know.

The great advantage to us as Merchants is that we not only have the details of each sale made, but we know at a glance the total amount of each mans account, it being posted up to date. It also avoids errors in transcribing. Nick it has proved satisfactory to purchasers as we always deliver a carbon copy with each sale showing items in detail as well as total sum of account to date. We have the system working so satisfactorily and smoothly that practically no mistakes are made in operating.

Yours very truly

There is undoubtedly a big market for Mill Equipment of all kinds. Let us Demonstrate our Advertising service. We please others, we can please you.

Western Lumberman

Crowe & Wilson Chambers
VANCOUVER, B. C.
Branch at Winnipeg

EDGINGS

Ontario

The Briggs planing mill at Brockville, Ont., was recently destroyed by fire, the loss amounting to $20,000.

T. H. Colling, Simcoe, Ont., is contemplating the purchase of a sawmill and equipment for use at South Middleton, Ont.

The sawmill belonging to Archibald McTavish, of Cedarville, Ont., was recently destroyed by fire. The machinery and lumber were also destroyed. The loss was partly covered by the insurance.

The Consumers Box and Lumber Company, Toronto, report that their basket factory which was recently destroyed by fire at Grimsby, Ont., will be rebuilt in the near future. They have not yet decided as to the size of the new plant.

An accident which occurred at the plant of Shepard & Morse at Ottawa on August 4th, resulted in their driving engine being completely wrecked. The connecting rod broke, the head of the cylinder blew out and damaged the end of the engine shed. The accident will cause the mill to be closed down for two weeks, resulting also in 125 men being temporarily out of employment. An electric motor will be installed, until a new steam engine can be put in.

J. E. Baechler, Goderich, Ont., whose sawmill and planing mill were destroyed by fire last May, and who has made considerable progress in the erection of a new plant, reports that the town council of Goderich and the Board of Trade have suggested that he should continue the building to a height of three storeys and install a furniture factory. They are offering the firm a loan of $25,000 for this purpose, and are preparing a by-law to submit to the ratepayers in this connection.

The James Smart Manufacturing Company, of Brockville, Ont., whose woodworking department was recently destroyed by fire, report that they will replace it with a reinforced concrete building, 100 x 50 ft., three storeys high, as nearly fire proof as possible. The machinery will be driven by electric power. No contracts for the building have as yet been let, but it is expected to cost about $12,000. The building, together with the machinery and equipment, are expected to cost between $20,000 and $22,000.

Eastern Canada

Herbert J. F. Grier, lumber merchant, Montreal, Quebec, has been registered.

Mr. Thaddeus Graves, New River, N.B., recently lost his portable sawmill by fire. The loss amounted to $8,000.

The engine house of Murray & Gregory's mill at St. John, N.B., was destroyed by fire recently. The loss is said to be about $6,000, covered by insurance.

A small fire occurred on July 19 at the lumber yard of the Redfern Lumber Company, Montreal, the damage being estimated at $1,000. The fire brigade arrived before the fire in the piles had made much headway.

The Nova Scotia Lumber Company's lease of lumber lands at Walton, N.S., having expired, they are leaving the locality. The mill property has been purchased by Messrs. Albert Parsons and Ezra Church, who will manufacture barrel staves, heading and other material. The loss in business occasioned by the withdrawal from Walton of the N. S. Lumber Company will to some extent be made up by the use of the mill for other purposes.

A serious fire occurred at the Gilmour & Hughson yards at Hull, P.Q., recently, destroying about 7,000,000 feet of various grades of pine, valued at about $200,000. About 4,000,000 feet of this was owned by Hughson & Company, of Albany, N.Y., and most of the balance by Gilmour and Hughson. Thomas Mackarell lost about 25,000 feet. The total loss was covered by insurance. The cause of the fire is not known, but it is believed to have been started by a lighted match or a cigarette being thrown upon inflammable material by a passer-by.

Western Canada

The Beaver River Lumber Company, Limited, has been incorporated, with head office at New Westminster, B.C., and capital stock of $50,000.

Later reports from Nanaimo place the loss to the New Ladysmith Lumber Company, on account of the destruction of its mill by fire, at $100,000, with about half that amount covered by insurance.

It is reported that as a result of the visit to Victoria of J. Langley, representing a group of New York capitalists, arrangements have been about completed for the reopening at an early date of the mills of the Canadian

Puget Sound Lumber Company, this plant having been shut down for several months.

Wm. Gilfoy, Calgary, Alta., advises us that the report to the effect that he had recently sold extensive timber limits along Seymour Inlet, B.C., to a syndicate of California capitalists is incorrect. He adds that California and Denver capitalists are negotiating for the purchase of twenty limits located on the south side of Drury Inlet, B.C., but the deal has not yet been closed.

The six per cent. first mortgage bondholders of the Canadian Pacific Lumber Company, Limited, Vancouver, B.C., held a meeting recently at London, Eng., and passed a resolution to release the company from the payment of any moneys payable under the trust deed of April 1, 1914. The company has met with financial difficulty on account of the delay of the Exchequer Court in giving a decision regarding compensation for the expropriation of its property in Vancouver for wharf accommodation. A settlement of this matter is expected in the near future.

The Wellington Lumber and Trust Company, Wellington, B.C., has been formed to engage in the manufacturing business at Wellington, two miles south of Westbridge. The company expect to employ about 2,000 men and will erect a sawmill with a capacity of 200,000 feet in 24 hours, a box factory, brick plant, pulp and paper mill and electric light and water power plant. It is the intention to employ married men only, to whom the company will sell lots and for whom they will build houses, accepting payment on the installment plan. The White Pine Supply Company, of Spokane, are the promoters of the company and it is being financed by eastern capitalists.

Trade Enquiries

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names of enquirers by writing to the Department of Trade and Commerce and stating the number of the enquiry.

529. **Douglas fir, British Columbia cedar, silver spruce, hemlock and pine.**—A large importing house having purchased some Canadian woods through a London agent, is desirous of opening up direct trade.

612. **Box shooks.**—A London importer of box shooks wishes to obtain supplies from Canada upon a commission basis, and would be glad to receive quotations upon specification, details of which are procurable from the Department of Trade and Commerce.

613. **Maple planks.**—A London firm seeks supplies of maple planks (clean, without knots) square edged, each 1½ in. thick, 4 ft. 6 in. long, 11 in. and up wide. Quotations required ex-dock London.

614. **Douglas fir.**—A reliable importing firm in Colonge will be pleased to receive samples and prices from Canadian exporters delivered c.i.f. Rotterdam.

615. **Douglas fir.**—A large lumber house in Cologne wishes to receive samples and prices, delivered c.i.f. Rotterdam.

617. **Douglas fir, cedar, maple, elm, ash, oak staves and railway ties.**—A large lumber importing house in Cologne wishes to enter into correspondence with Canadian exporters of above woods.

618. **Douglas fir and British Columbia cedar.**—A Mannheim importing firm would like to receive samples and enter into correspondence with Canadian exporters.

620. **Douglas fir, British Columbia cedar, red and white wood, silver spruce.**—A large Mannheim importing house wishes to enter into communication with Canadian exporters of the above.

625. **Redwood lumber for mouldings.**—Five-eighth-inch by 4-inch thick; 1½-inch by 4-inch wide; 10-foot length and upwards. A Mannheim firm desires samples and quotations.

627. **Douglas fir.**—An importing house in Dusseldorf is prepared to enter into correspondence with Canadian exporters with a view to opening up a direct trade.

631. **Douglas fir, British Columbia cedar, white wood, hemlock.**—A large importing house in Dusseldorf wishes samples and prices delivered c.i.f. Rotterdam.

635. **Sawn birch logs.**—Firm in Frankfort-on-the-Main would like to receive offers from Canadian exporters of birch logs, square hewn, part of bark removed. Thickness 20-inch by 24-inch; width 20-inch by 24-inch; length 9 ft. to 12 feet.

688. **Lumber.**—A South African importer would like to be put in touch with Canadian exporters of lumber. Quotations must be f.o.b. Canadian ports.

705. **Pulp and paper.**—British house, old established, of highest standing with first-class references wants agency of good pulp and paper mills; cash advances and financial facilities granted.

725. **Box shooks.**—A London firm claiming a large connection among users of box shooks suitable for fruit and flowers, would be glad to consider offers from Canadian sawmills.

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale:

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 8-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.

1 Double cylinder steam nigger, right hand.

1 Log Loader for right hand mill.

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.

1 left-hand steam nigger.

1 Log-loader.

1 Endless chain jack ladder with two kickers complete for right and left hand mills.

2 Roger Gang Edgers for 8-in. cants and lumber.

1 Waterous double edger, 6 saws.

2 2-saw trimmers.

1 20-ft. Slash table.

1 16-ft. Revolving Slash Table.

1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works.

1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.

1 Lath Mill with bolter.

2 Lath Trimming Saws.

FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.

1 Automatic Grinding Machine for 8-in. S.C. band saws.

1 Automatic Machine for circular saws.

1 Hand Machine for cut-off saws.

1 Lap Grinder.

1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws.

POWER PLANT

2 Double Duplex, high pressure Water Pumps.

5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.

2 125 h.p. Water Wheels.

1 Upright Engine for sawdust conveyor.

1 10 h.p. Engine.

1 Mitts & Merrell Hog.

1 Wood Machine for 22-in. wood.

1 Wood Machine for 16-in. wood.

1 Edger for ripping dry lumber, installed.

1 Edger for ripping dry lumber, not installed.

1 30 h.p. Generator, 250 volt.

1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

The
Parry Sound Lumber Co.
Limited

26 Ernest Avenue, TORONTO, CANADA

ONTARIO
Canada's Banner Province

Ontario produces 40 p.c. of Canada's total output, 1913 valued at $26,774,937.

Pine production, 905,442,000 ft. B. M.
Pulpwood, - - 246,282 cords.
Railway Ties, - - 5,704,459.

Ontario's woodworking industries, using 34 different kinds of wood, provide a ready market for the lumberman. Eighty-two per cent. of lumber used in Ontario's industries purchased within the Province.

Ontario's vast resources offer unsurpassed opportunities to the lumberman.

For maps of the Province and timber regulations apply to

Honorable W. H. Hearst,
Minister of Lands, Forests and Mines,
TORONTO

Haul Your Lumber

From the mill to the yards with

Milwaukee Gasolene Locomotives

THEY are the modern motive power for track haulage, simple in design, ruggedly built, reliable and economical in operation and ***absolutely safe*** around the most inflammable material. ***No sparks. No fire risks.***

Many of the largest lumber manufacturing companies are now using Milwaukee Gasolene Locomotives as their sole form of motive power at a saving of 30 to 50 per cent in haulage costs.

Milwaukee Gasolene Locomotives

will ***reduce your haulage costs*** and ***increase your profits*** also. Let us tell you how and why. We build them in many types, for all gauges of track and in sizes up to 50 H. P. They are illustrated and described in Catalogs N102 and N103. Write for your copies today.

"The Missing Link"

DROP FORGED
FROM HIGH GRADE STEEL

Made in sizes 1/4" to 15/8"

These links are the only ones which compare with the same size chain and are fully equal to it in strength. The great advantage of this is self-evident. Their use means a saving in expense and time. No other link approaches them. We also manufacture a large line of CONTRACTORS' SUPPLIES and MOTOR BOAT FITTINGS.

If a dealer, ask for our 450 page catalogue.

The
Thomas Laughlin Company
Portland, Maine, U.S.A.

Reduce Your Fire Risk by Using Fairbanks-Morse Internal Starter Motors.

No complicated starting apparatus is required as they are controlled by simply closing or opening a line switch. The varying resistance necessary for starting is secured by varying the pressure on a number of carbon discs which form one of the three resistance units. There being no moving contacts there is no chance of sparking and fire risk is practically eliminated as far as your motor is concerned.

The gradually increasing pressure exerted by centrifugal force on the carbon discs gives a very smoothly starting motor.

A simple screw adjustment of the resistance units allows the starting torque to be changed from normal to 200 per cent. full-load running torque if required with a starting current of about one-half that required by the ordinary squirrel cage motor.

Send for Bulletin No. 210.

St. John, Montreal, Quebec, Ottawa, Toronto, Hamilton, Fort William, Winnipeg, Regina, Saskatoon, Calgary, Edmonton, Vancouver, Victoria.

DISSTON CROSS-CUT SAWS

Speed and Ease

in cutting are two important points to be considered when buying cross-cut saws. Both these qualities are the direct result of the methods used in manufacturing, and the designs of the blade and teeth.

The combined hardness and toughness of the steel are other qualities that are necessary for durability and efficiency. All the good points that go to make perfect cross-cut saws are found in Disston Saws.

The Reasons Why

Disston Cross-cut Saws meet with increasing favor every year can be summed up as follows:

They are ground a true taper all the way from cutting edge to an **extra thin** back. Being ground on lines that conform exactly to the breast of the saw, the blade is absolutely uniform in thickness throughout the entire length of the cutting edge. This special method of grinding gives the maximum amount of clearance with the minimum amount of set, without sacrificing elasticity and stiffness. Any man accustomed to a cross-cut saw knows what that means.

The Disston Crucible Steel that is used in their making combines the hardness and toughness which produce the unexcelled edge and set-holding qualities found only in Disston Saws.

BATTS' STAVED COLUMNS

Our Columns are made with a special Lock Joint which prevents the staves from opening, and also increases the glueing surface. We use the best water-proof glue obtainable. In connecting the cap and base to the shaft of our columns, both ends are bedded in Mastic Putty. By this method, water or moisture is prevented from getting to the inside.

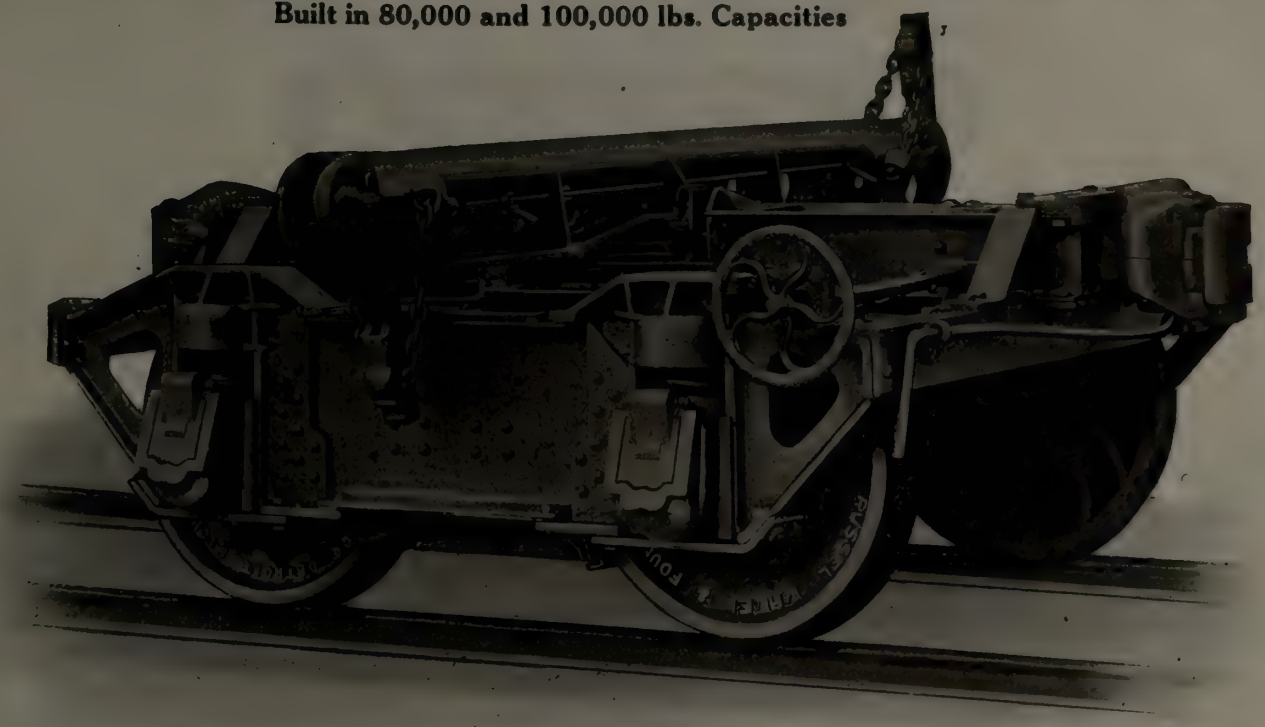
A NEW TYPE
Russel All Steel Pacific Logging Truck

Built in 80,000 and 100,000 lbs. Capacities



100,000 lbs. Capacity Truck

This truck was built to meet the demands of the severe service on the Pacific Coast and can be equipped with Russel Spear Edge Bunk with Drop Stakes or Adjustable Chocks, or Turn Back Bunk

An all steel truck which is stronger and lighter. No parts are below the axles and cannot be damaged from derailments. The wheels and axles and couplers are easily removed.

The increasing demand for the Russel Car has more than demonstrated its adaptability to the Pacific Coast.

Skeleton Type Logging Car

Russel Spear Edge Bunks fitted with Drop Stakes or Adjustable Chocks are practically indestructible. Logs cannot slip over Spear Edge which grips the logs firmly. The Drop Stake is absolutely safe and drops down below the bunk and does not project. The Adjustable Chock when dropped projects 1½" past the bunk and cannot be lost or broken.

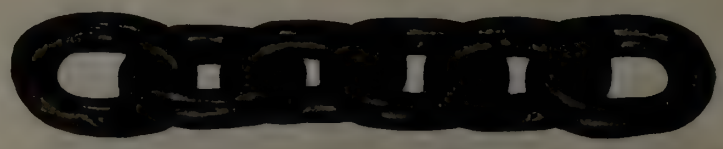
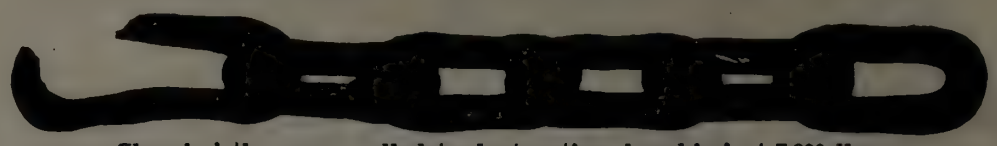
"Ajax" Loading Chain

Greatest Strength in the Smallest Chain



Above Cut shows a piece of 9-32 inch Chain proof tested to 3,000 lbs.



Showing the same pulled to destruction, breaking at 7,800 lbs.
(See how this Chain stretched before breaking.)

WELD:

Sectional view showing comparative size of weld and chain.

The stock is overlapped on itself, carrying the lap around over half the length of the link and worked down under the hammer in such a way as to allow a swell in the weld end when finished, and giving a factor of safety not used in ordinary practice. This method of forming the link and building the weld makes the weld the strongest part of the link, as shown in above link which broke at the end opposite the weld end. In ordinary practice Chain invariably breaks in the weld, the lap not extending far enough around and not having sufficient work on the weld to insure equal strength of the material itself.

STOCK: Our long experience in the manufacture of Chain has taught us that a high grade Chain cannot be made of poor or cheap material, and we are using the best steel obtainable for this Chain, far superior to the Norway iron formerly used for making this grade of Chain, being higher in tensile, tougher and withstanding greater wear.

INSPECTION: We keep inspectors constantly inspecting the manufacture of the Chain at the fires, also prior to and after proof testing, to prevent any Chain leaving the factory which will not come up to our guarantee.

TEST CERTIFICATE Every pound of this Chain is proof tested to strains shown in our catalogue and test certificate furnished. Breaks are made often enough to insure quality being maintained.

GUARANTEE: This Chain we will guarantee to pull stiff before breaking and every pound will be replaced which does not meet this guarantee. In other words, this is a guarantee that every weld is perfect and that the stock itself is uniform.

Users of **"Ajax"** Chain are always satisfied customers and our friends: and, like all others we desire to increase our friends. Allow us to do so by shipping you **"Ajax"** Chain.

McKinnon Swell-Weld

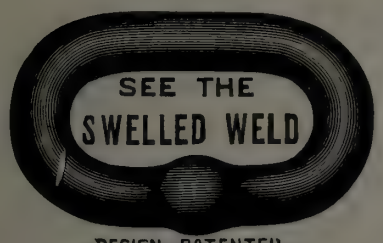
"Dreadnaught" Steel Loading Chain

Does not break at the Weld

MADE IN CANADA

MADE IN CANADA

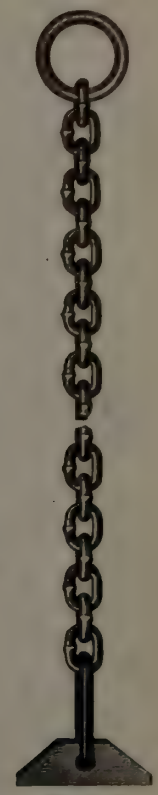
5-16 in. Dreadnaught Steel Loading Chain, pulled to stock break at 9230 lbs. proving the weld the strongest part of the link. Tested at Syracuse University September 27, 1912.



DESIGN PATENTED

Note the increased material at the weld, strengthening the only possible point of weakness, by the addition of 25% more stock and thereby adding 25% more strength. In our chain the weld is actually the strongest part of the link.

DESIGN PATENTED



Ring and Sheared Toggle

The strength of a chain is that of its weakest link, therefore, a chain for loading purposes is required to have all links perfectly welded and of uniform strength. Our chain is formed and welded on automatic machines, with pressure and current so regulated to give each weld exactly the proper amount to assure a perfect joint.

The material used in the manufacture of Dreadnaught Steel Loading Chain is the highest grade of steel, made to special analysis to meet our requirements. Samples of chain are constantly being taken from the welders and tested to destruction Unless samples show a stock break, that run of chain is rejected. Every pound of chain is actually proof tested before being shipped, this test being higher than the safe working load.

All chain is sold under our absolute guarantee of weld perfection, with replacement free of charge if it breaks at the weld.

Combined tensile and distortion test, proving weld perfection

Made in Canada at St. Catharines, Ont.

Size Drive Pulley	20 by 10 inches	Length Track	32, 40, 48 or 56 feet
Feed per Revolution of Saw	0 to 3¼ inches	Style and Opening of Blocks	Cl-36 inches
Feed Belt	4-inch Gandy	Style Mill Dogs	Pony Excelsior
Largest Diameter Saw	56 inches	Style Set Works	No. 1 Single Ratchet
Length of Carriages	12, 16, 20 or 24 feet		

With each complete size "S" mill we furnish one saw, wrench, cant hook, feed belt, pulley with boxes for tightener and foundation bolts for husk.

Knight

Pony Lath Mill

This mill is built for use with a 10 to 15 horse power engine and as single mill only. It is specially suited to the requirements of thresher and saw mill men operating in small tracts of timber, as both husk and carriage are of a size which will permit of easy loading between the standards of a wagon when moving from one setting to another.

Write for the catalogue of the Knight line of saw mill machinery.

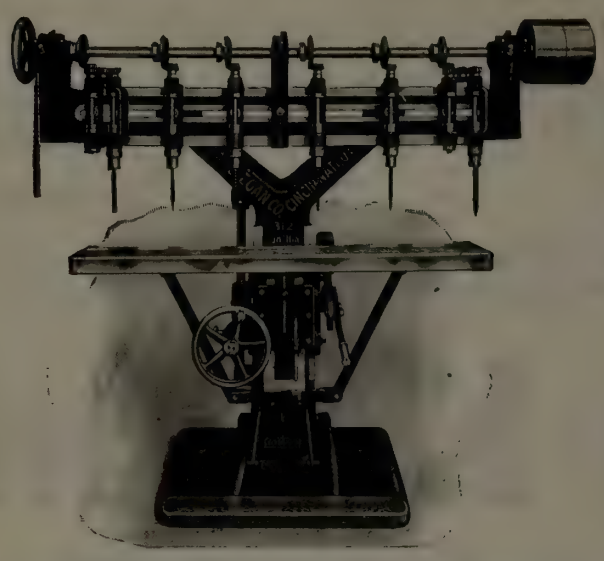
Free---Catalogue No. 92 showing a complete line of

Modern High Duty Wood-working Machinery

MR. Woodworking Machinery User, we will send this handy reference Book to you free of charge. It contains illustrations and descriptions of the most modern machinery for the Saw and Planing Mill; Car Shops; Box, Sash, Door and Blind Factories; Furniture Plants, etc.,—it gives details of construction and capacity. You should have it filed in a handy place.

Perhaps one of your machines is holding down the entire capacity of your plant or it may be eating up all your profits—with the handy size No. 92 Catalogue, you can quickly find the tool to do the work at the lowest possible cost. Perhaps you are running two or three machines where one new one could do the work. It would pay you to go over your present equipment and put in the tools that will bring your whole plant up to the highest standard.

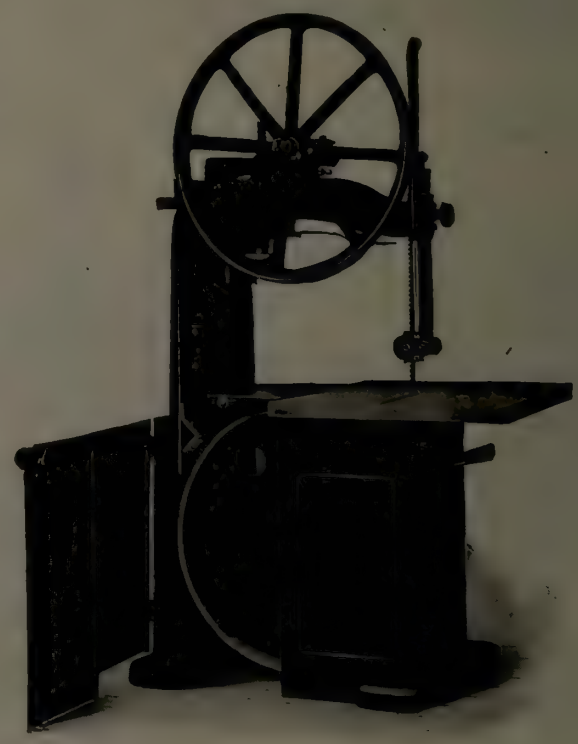


FAY-EGAN "Lightning" No. 312 Multiple Borer will bore all the holes in your piece of stock at one stroke of table—or the time taken to bore one hole with single spindle borer.

If you are building a new plant this book will be a great help in the selection of the proper tools to make your plant up-to-date, a profitable investment and manufacture your product at the lowest cost.

No user of Woodworking Machinery should fail to fill in the coupon and mail it today for a copy and get some new ideas on cost cutting labor saving and profit boosting machines. Thousands of your fellow manufacturers have found it profitable to send for this book and check up their equipment. It will pay you to do the same.

FAY-EGAN "Lightning" No. 330 Variety Saw the most accurate and quick adjusting machine made. The combination tool for the small shop when equipped with Hollow Chisel Mortising and Boring Attachment.



FAY-EGAN "Lightning" No. 50 Band Saw, square column and patented knife edge straining device make this saw produce more work at less operating cost than any other.

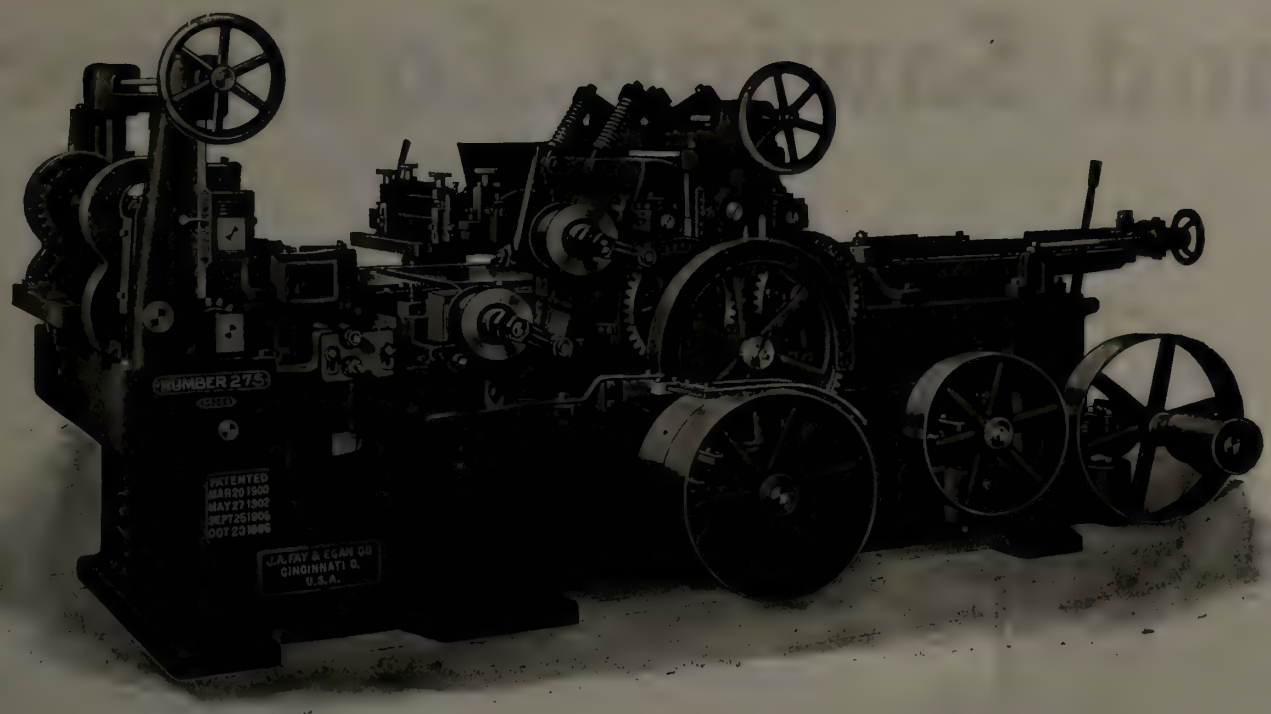
The medium weight and medium priced Planer and Matcher for the general mill

FAY — EGAN "LIGHTNING" 275



No. 275 will do

—all the matching and sizing up to 24″ x 8″.
—all the double surfacing up to its full rated capacity.
—all the flooring you will need.
—all inside molding up to 1¼″ deep.

In one factory it runs

over eight million feet of 1″ x 7″ roofers in one year.
—in another it works anything from ½″ ceiling to 16″ x 18″ sizing.
—in an implement factory, it works 10″ oak and hickory, four sides taking a ½″ cut 3⅝″ thick on the side heads, and always does it satisfactorily.

Initial cost

and operating expense are well within the means of every planing mill and factory owner —every convenience and time saving adjustment of the Fast Feed machines are incorporated in the 275.

It has made money---

big money—for hundreds of successful planing mill and factory owners, men who, like you, are operating a general purpose mill. It will do the same thing for you.

You are losing profit every day you wait—send the coupon to us today—now.

Our line of Planers and Matchers has the machine just suited to your work.

BERLIN RESAWS Assure More Profits—Every Hour of the Day, Every Day of the Week, Every Week of the Year.

Berlin Resaws Produce Economically

These resaws are especially adapted to Canadian Planing Mill and factory conditions. No. 341 has 54-inch wheels and tilting feed works. No. 342 is a 64-inch, short saw machine with large capacity and powerful feed works.

There's a Berlin resaw especially designed for your work. There are single verticals for light, medium or heavy duty and a twin vertical for long shook stock; the single horizontal and the twin horizontal for resawing short shook stock, besides the slab resaws. All Berlin band rip and resaws and band mills are simple in design and operation and easily kept in order. Whatever ripping or resawing you want to do can be done at lowest possible cost on a Berlin.

Easy to Operate

On Berlin resaws the conveniently placed operating devices make maximum results easy to obtain. That's why any average workman can successfully operate them and also why reduced cost is assured.

The wheel tilt and quick cross-line adjustments are especially conveniently placed. The top saw guide adjusts from the front of the machine; a throw of a lever changes the speed of feed. The rolls are positioned by a quick, accurate set works.

Easy to File For

Filers say that blades on Berlin resaws endure longer runs at fast feeds—that our very sensitive Knife-edge straining device is assurance against cracked blades. The saving made because of low upkeep cost of blades and machine is one reason for installing Berlin resaws. Before you decide on any particular resaw, investigate thoroughly the merit of Berlin "Quality" built band sawing machinery. Berlin resaws are working in many Canadian mills. See one in operation.

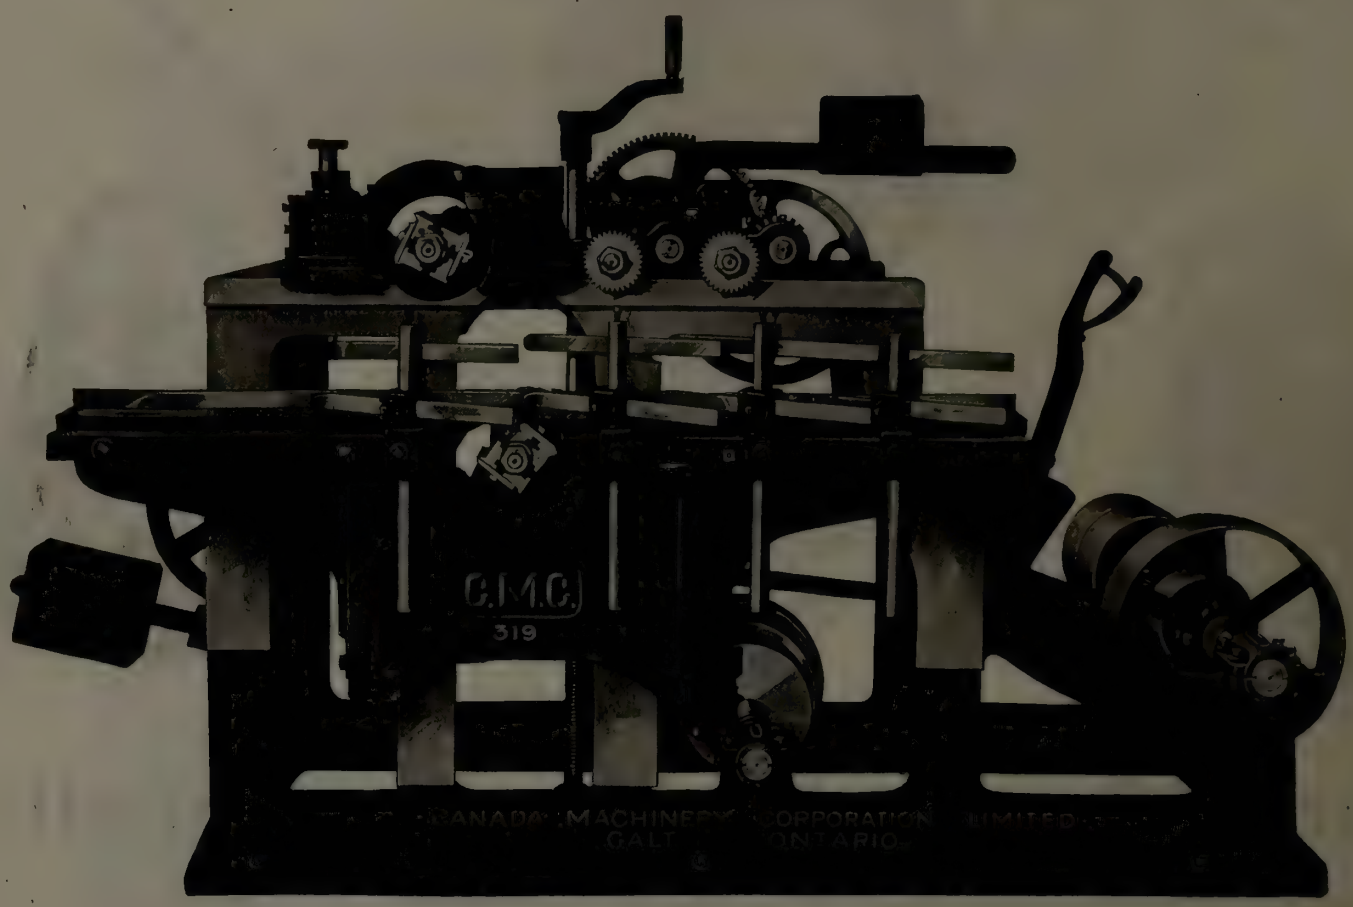
We'll send you complete data and the address of your neighbor user if you'll drop us a card request.

BERLIN MACHINE WORKS, LIMITED, Hamilton, Ont.

Largest Manufacturers of Woodworking Machinery in the World

UNITED STATES PLANTS, - - - - BELOIT, WISCONSIN

DOOR C.M.C. STICKER



No. 319 Double Door Sticker

Designed for sticking both edges of stiles and rails for doors and sash at one operation.

The feed rolls are made to swivel on the frame, a new "C.M.C." feature that meets with the approval of practical millmen. This arrangement enables the operator to adjust the lead of the rolls to suit the quality of the material, thus overcoming the difficulty often experienced with machines of this class.

Three rates of speed can be obtained, and the change made from one rate to another without stopping the machine, thus saving considerable time.

It will take stock from 2½ inches to 15 inches wide and up to 4 inches thick.

Descriptive Bulletins on Request.

BUILDERS OF HIGH GRADE WOODWORKING MACHINERY

"Leather, like gold, has no substitute."

A Busy Belt For 86 Years

Here is a striking example of what we mean when we say our belting costs less per day of service.

The big belt in the circle started work in 1878 and after being on the job for thirty-six years it was replaced by a new one. The other five belts were rebuilt from the original and each is good for a minimum of 10 more years of service—an aggregate of 50 years! Making the total aggregate of 86 years of service.

Everyone of the selected hides we buy is tanned in our own tanneries under our closest supervision. One of the many reasons for quality in our belting.

Ours are the belts that should be on your pulleys. Write us about your next order.

Maple Leaf Saws

Maple Leaf Saws

Going Strong Again in Our New Plant

With our fine new manufacturing plant at Galt, Ontario we are in a better position than ever to turn out the best quality of saws and tools.

The "Maple Leaf" tempering process has always been acknowledged the best in the world. With a complete new plant behind the process, the "Maple Leaf" brand of saws will stand farther than ever in the forefront.

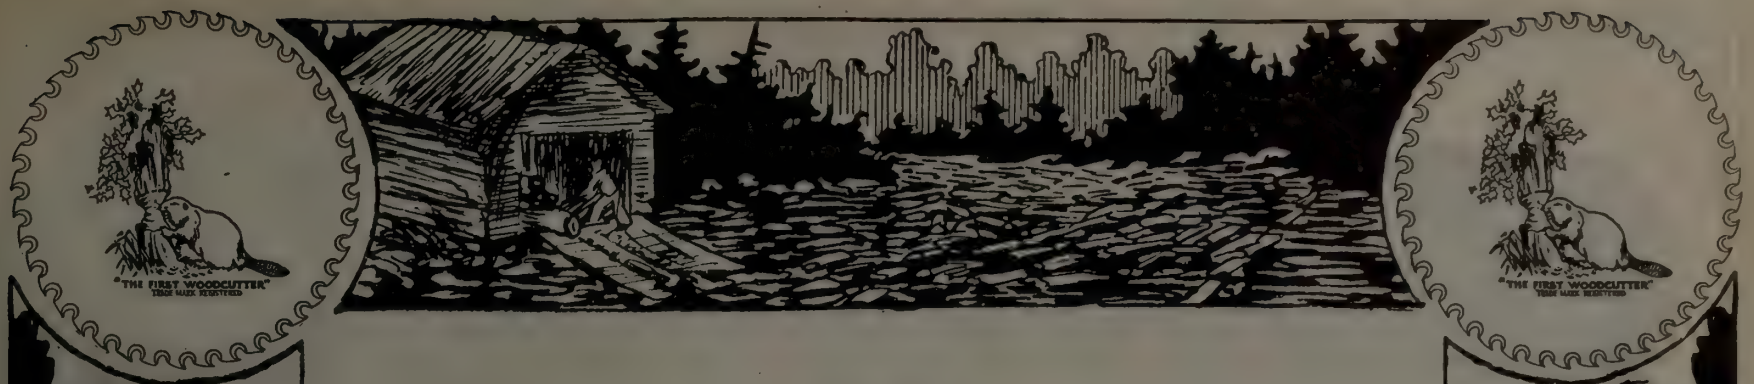
Large stock of saws in Western Canada at our Vancouver Branch. Also branch at Hull, Quebec.

Shurly-Dietrich Company, Ltd.

Galt, Ontario

and 1642 Pandora Street, Vancouver, B. C.

No. 55 Improved Racer Cross-cut Saw



Radcliff Saws

IN Radcliff Saws lumbermen will find the highest degree of perfection. They are tempered to maintain their keen edge and tension, pliable enough to avoid breakage and rigid enough to be economical in effort

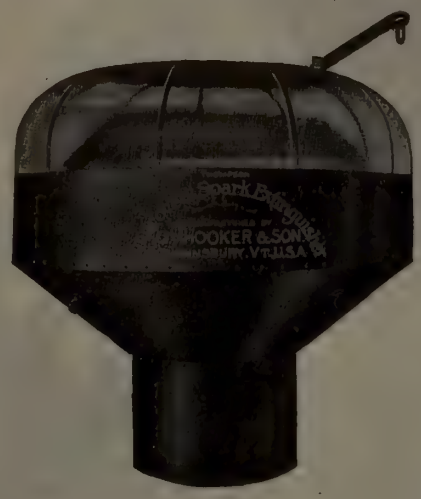
Radcliff Saws are made in every type, inserted tooth, solid tooth rift saws, shingle and heading saws, grooving saws, mitre saws, wide and narrow band saws, mill saws, drag saws, gang saws, cross cut saws. Also machine knives.

We are distributing agents for R. Hoe & Co.'s saw bits and shanks. Carborundum "Aloxite" grinding wheels and Nicholson files and rasps. A complete stock always on hand.

Write for catalogue of Radcliff saws and mill supplies.

Radcliff Saw Mfg. Company, Limited

Toronto - Ontario



Where wood is used for fuel, the

Thompson Improved Spark Extinguisher is a Positive Necessity

This is the only appliance for the tops of chimneys and stacks that is warranted to extinguish all dangerous sparks without choking the draft.

It is no untried experiment, as there are hundreds in use at the present time which are giving complete satisfaction.

Insurance companies make substantial reductions in their rates where this device is used.

We will gladly send you special booklet on request.

"We Know How"

American No. 15 Edging and Ripping Saw.

Match Up and Joint Your Stock in one Operation on Our

No. 15 Edging and Ripping Saw

IN work to be overlaid with veneers, such as library tables, dining tables, etc., and in cheaper grades of furniture, such as kitchen tables, our No. 15 will match up and joint the stock, making the use of a hand jointer unnecessary. With this fact in mind you can readily understand how great a saving can be made in time and labor by the use of this machine. We can demonstrate the fact to you that our No. 15 can pay for itself in a short time.

Smooth Running

Absolutely no vibration, which is essential in accurate ripping and edging, and adds greatly to the life of the machine.

Feeding Mechanism

A hand lever at the left of operator controls the starting and stopping of the feed, which consists of two upper driven rolls, and a double endless feed chain in the table on each side of saw, carrying the stock through the machine with a positive straight feed, and leaving it with a smooth edge.

Table

A large hand wheel at feeding-in end vertically adjusts the table, which is supported by two screws with ball end bearings.

Feed Rolls Lift

The Feed Rolls are easily and quickly raised and lowered by a hand crank and ratchet near the operator.

Capacity

It will rip perfectly straight any length and take stock as short as 5" by the use of our intermediate hold down rolls and 14" long with our regular Feed Rolls and up to 26" wide from saw to gauge.

Quality of Work

You will be more than pleased when you examine the quality of work done on our No. 15—the work will plainly show a higher standard of manufacture at a lower cost.

Our No. 15 is the latest machine of its kind on the market-and it is in advance of any other similar idea-write for circular.

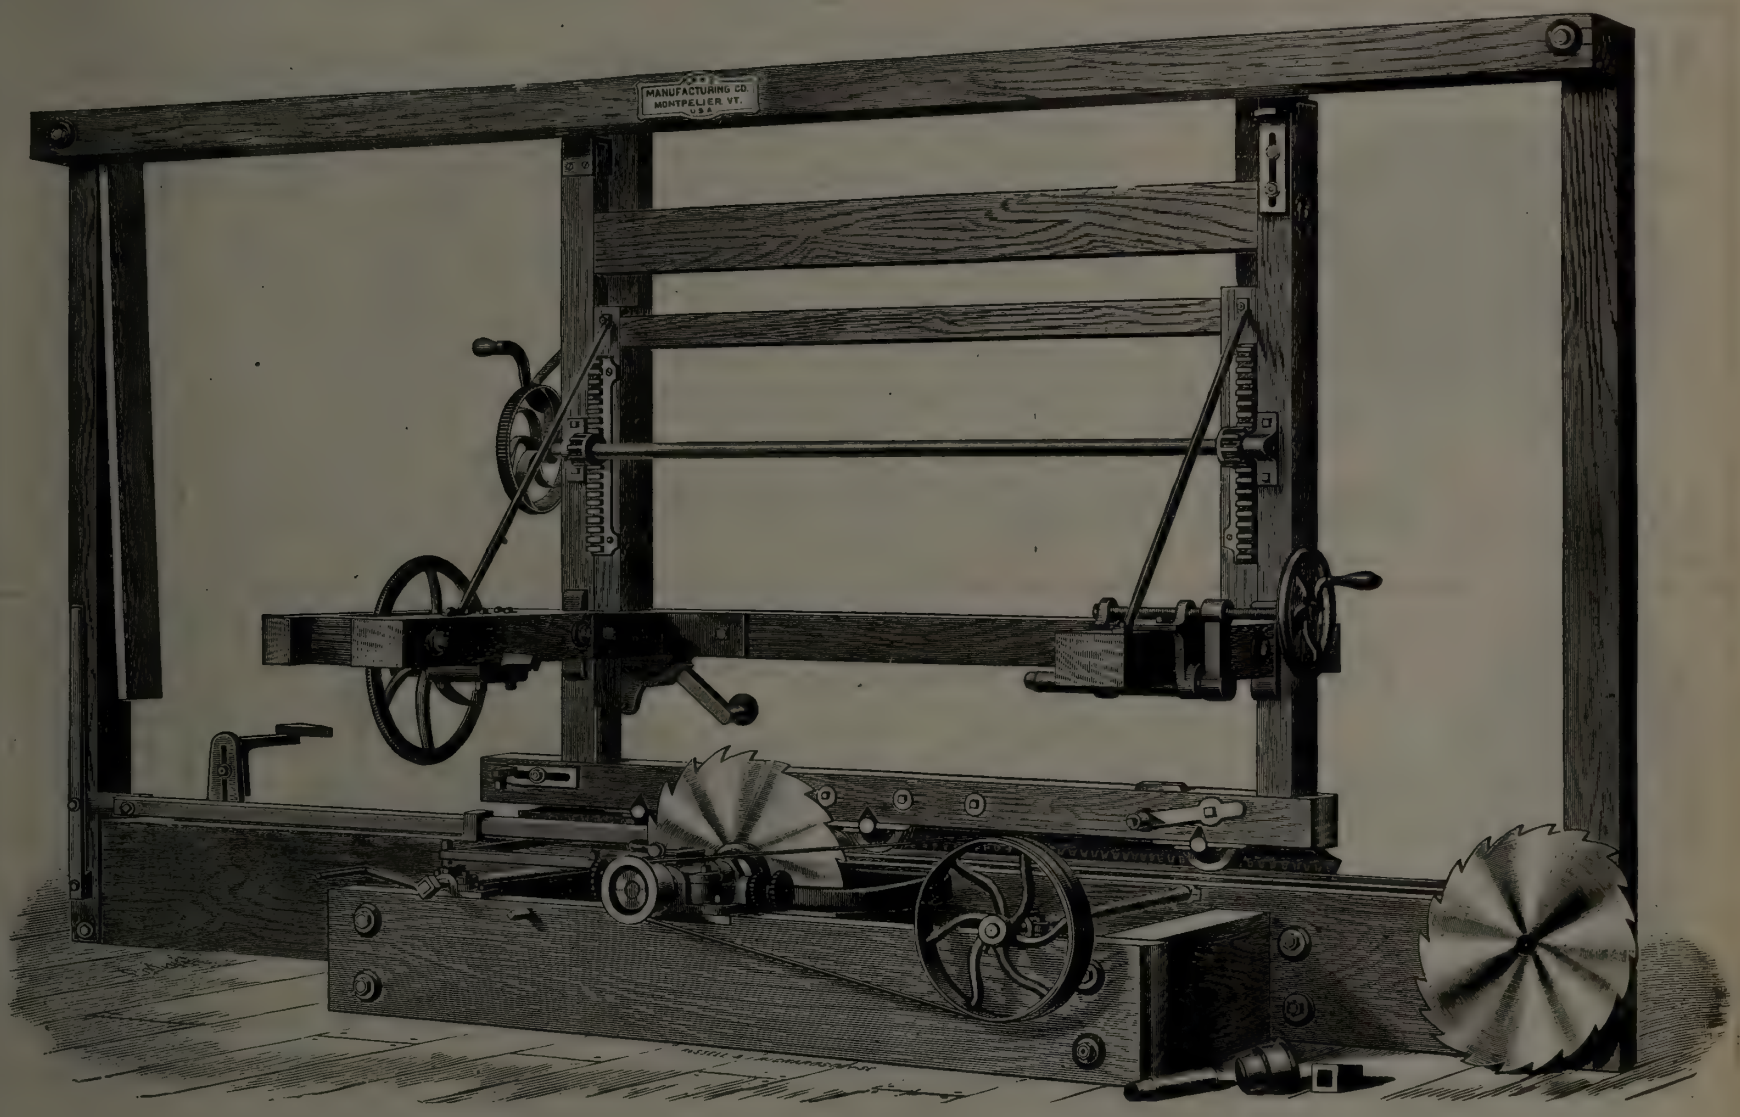
The LANE Clapboard Sawing Machine

For Making Clapboards Direct from the Round Log



The Lane Automatic Clapboard Sawing Machine is built to cut 4 ft. or 6 ft. stock or both lengths. It can be fitted with sapper knives on the saw collar, and used thus as a complete machine, but we advise its use in connection with our Clapboard Log Lathe, which removes the bark before the logs are placed in the Sawing Machine. We also make a

DOUBLE CLAPBOARD PLANING AND JOINTING MACHINE

and clapboard Clippers, or trimmers, for squaring the ends. The Lane Guarantee covers them all.

Dixon's Graphite Axle Grease

In hottest summer—in coolest winter—in wettest weather—under all conditions—here is a grease that can be depended upon to give real lubrication. Your teams will pull more because your wagons will pull easier. The fine flakes of lubricating graphite in this grease form a solid lubricating shell on axle and bushing that is so lasting as to greatly reduce the amount of grease needed to keep the wagon stock running right. Send for "Axle Grease Booklet," No. 238.

DRYING VENEERS

is one of the most important operations of veneer manufacture. The old method of drying in racks is too slow, and requires too much floor space and labor for handling.

THE "PROCTOR" VENEER DRYER

is an evolution of the rack drying method with the disadvantages eliminated. The **"Proctor"** Dryer is automatic and requires very little floor space, labor, and time for the operation. Veneer is dried by tremendous circulation of warm air.

The Shaw Motor Headworks

The Modern Method of Towing Logs

Read Mr. D. M. Prices' letter reproduced below, and do not delay asking us for full information. Orders for spring delivery should be in at once.

Fort Frances, Ont.,
June 29th, 1914.

Russel Brothers,
Fort Frances, Ont.

Gentlemen:

Answering your enquiry as to the service we are getting from your Shaw Motor-Headworks.

I have inspected this boat at work, and have also taken this matter up with our boom superintendent and we have yet to find anything in this line that the Shaw Motor-Headworks is not adapted for.

Your advertised towing capacity of three million feet of logs is well within its limit, as we find that it will tow this quantity as fast as logs will stay in a boom.

We intend using these boats in place of the horse headworks or capstans for breaking rollways and towing, as the reduced cost of operation and the time saved will more than repay us for the outlay.

We will be pleased to have you refer any prospective purchasers to us as we are entirely satisfied with this machine.

Yours very truly,
Shevlin-Clarke Company, Limited,
By D. M. Price,
Superintendent Logging Department.

You should do your towing as cheaply as your competitor. But you can't—without a

Greater Capacity
Less Power
Material Saving in Expense

May be accomplished by the use of

Sturtevant

(REG. CAN. PAT. OFF.)

Slow Speed Low Pressure Planing Mill Exhausters

(PATENTED)

In a medium sized plant, the power waste due to improperly designed and installed collecting system involving the use of high speed high pressure fans, amounts to many hundred dollars yearly. This amount could be added to the profits by substituting STURTEVANT Slow Speed Low Power Fans and by simple changes in pipe and collector.

These fans are adapted to the handling of many kinds of dust and refuse for either long or short distances.

Running at slow speed, they accomplish great savings in power over a high speed fan of the same size.

A New England manufacturer states that he saved the price of his *Sturtevant* Slow Speed Fan in two months through its more efficient operation.

Some of the largest lumber companies in the country are replacing their old systems with the STURTEVANT Slow Speed Fans.

Isn't this fan worthy of your investigation?

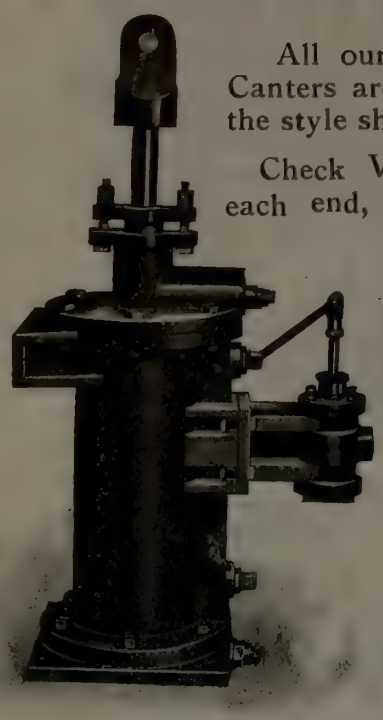
Log-Handling Machinery



All our Loaders, Kickers and Canters are made with cylinders of the style shown in the cut.

Check Valves are provided in each end, and all piping between valve and cylinder is eliminated. These cylinders are extra heavy and very durable, and are absolutely guaranteed by us.

We carry in stock at all times a complete line of Log Deck Machinery—so we can always serve you promptly.

Shall we send our Catalogue?

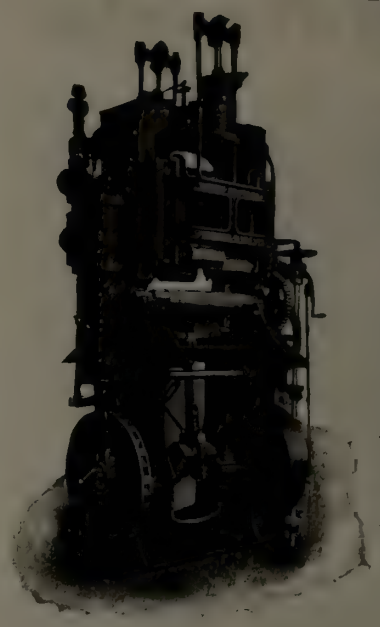
FLAT GANGS Unexcelled in the manufacture of

Flooring Strips **Cedar Siding** **Shiplap**
Silo Stock **Door Stock** **Box Lumber**
Boards

from cants and flitches, from either hard or soft woods.



ROUND LOG GANGS

JUST WHAT THE NAME IMPLIES—taking all your small logs just as they come from the pond and cutting them up into boards or dimensions, getting every board there is in the log, never over-slabbing (wish we could say this of all head sawyers.) Built to handle either one or two logs at once, up to 14 in. diameter.

KEEP THE SMALL LOGS AWAY FROM THE HEAD SAW and CARRIAGE entirely, raise your cutting capacity, and install ecomony by the same stroke.

Not an EXPERIMENT, but an ECONOMIC NECESSITY.

Think it Over Carefully, then Write us for Details.

"The Gang cannot Overslab."

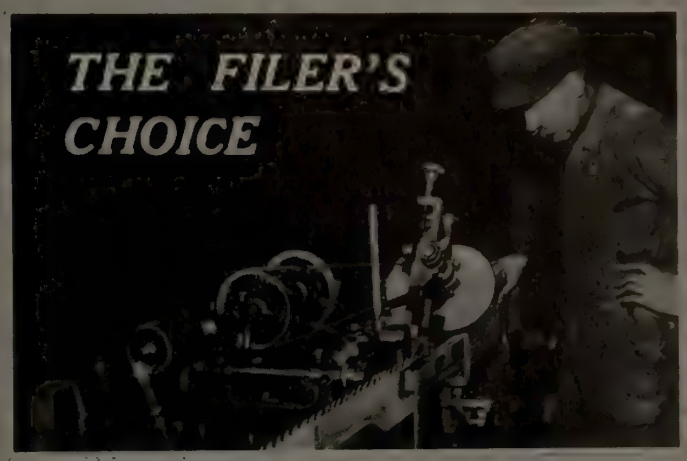
Not altogether what we say but what users say

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs, in calm weather, 30,000 in a head wind.

West & Peachey - Simcoe, Ont.



The filer's choice of saw gumming wheels is the wheel that cuts fast, free and cool—the wheel that will hold its shape—show long life—and cut quietly, quickly, easily—without case-hardening the saw or drawing the temper. These are just the qualities he will find in

ALOXITE SAW GUMMING WHEELS

And they are made right—right sizes, shapes, grits, and grades.

Good saw gummers are as necessary in your mill as good saws.

1628 pounds Constant Pull Without Slip—Only Cling-Surface Treatment Permits This

The belt, 18-in. double leather, shown, runs at 3,036 feet per minute and carries 150 h.p. from a 14 ft. driver to a 41-in. wood pulley. Distance between centers 23 ft. The picture was taken when pulling full load. There was no sign of slipping. Pretty good with 3 ft. 4½ in. slack, isn't it? But slackness without slip isn't the only good resulting from Cling-Surface treatment. The owner says:

"We have been using Cling-Surface for eight years with most satisfactory results on all sizes of belts and kinds of drives. When judiciously used it lessens tensions and increases efficiency as well as period of usefulness." H. H. Reid, Secretary, T. S. Simms & Co., Ltd., St. John, N.B., Canada.

If you are not treating your belts with Cling-Surface, you do them, the bearings, and yourself an injustice. Not only should the belt tension be reduced, the efficiency increased and the life prolonged, but the journal friction ought to be reduced, the driven machinery made to run more smoothly and quality of work improved. Cling-Surface accomplishes all these essentials and makes the belts perfectly dependable. It should be used on every belt without waiting for slip or other troubles.

Treat just one of your belts with Cling-Surface—note the improvement—we won't have to tell you to treat the rest. Cling-Surface is a money saver. All users know this just the same as the people mentioned above who have used it for eight years. Get our literature and give Cling-Surface a trial. Our quotations are f.o.b. Toronto.

The "Merit" Balanced Plate Veneer Drier
for Crossbanding and Face Stock

THERE is no drier on the market that can do the work performed by this machine as good, as fast or as cheap as The "Merit" Common Sense Drier.

No checking, no leaky pipes or packings—no flexible joints—Everything open, accessible and controllable.

Let us present our guarantee to cover drying of green veneer right from the log or for redrying of all kinds of stock in furniture, piano, door and panel factories.

Prospective buyers of Veneer Machinery are invited to visit our plant which is just an hour's trolley ride from Niagara Falls.

Merritt Manufacturing Company
Lockport, N.Y.

THE WATEROUS NEW CHAMPION EDGER

built with 40-in., 48-in. and 56-in. working opening, to carry as many as four movable and two stationary saws, will take all sized cants up to 6 in. The saw mandrel is 3⅞ in. diameter, saw collar 6 in., and saws 22 in. in diameter. This leaves 8 in. of saw above the collar—plenty of margin to allow saw to clear itself in a 6-in. cant.

Saws are shifted by straight line levers; they can be approached within 2⅞ in. of the stationary saws, and will approach each other within the same distance. To space them absolutely accurately, a steel setting gauge operated by foot tread from the front of the machine, drops over the guides and automatically crowds them into correct position and holds them there without shift. **This is a Waterous feature.**

Four chain driven feed rolls and four heavy press rolls handle the stock safely and easily. All boxes are fitted to require little attention. The feed rolls and mandrel drive is simple and positive and requires little power. The edger is built compact and strong of selected materials, and tested before leaving the shop. We stand behind every machine we turn out.

A dozen other points which make the New Champion Edger different and better are well illustrated and described in the new bulletin No. 113, which has just come in from the printers. Let us send it to you.

The Waterous Engine Works Co., Ltd.

BRANTFORD . CANADA

H. B. Gilmour, Vancouver, B. C. Winnipeg, Man.

The best Edger for medium capacity mills is one that will handle all medium sized cants that come through, that will operate with little power, that will take up a minimum of floor space, and that is built strong enough to handle the work fast and continuously. At the same time the Edger should be safe and easy to operate, simple to adjust and convenient for overhauling.

This Edger Fills the Bill

Slow Speed — Low Power Exhaust Systems

For removing Shavings, Sawdust, Emery Dust, Lint, Smoke and Odors

Is your Blower System satisfactory?——If not, we can make it so

What We Have Done For Others, We Can Do For You

Our System recently Installed in Largest Box Shook Factory in Ontario.

Clarke's A.R.C. Clothing

For

Lumbermen

Mackinaw Pants

The materials in these pants are the best that money can buy. The workmanship is on a par with our other goods.

The A. R. C. Brand of clothing contains every garment necessary for the complete outfitting of the lumberman for winter work in the woods.

Illustrated are a few of the A. R. C. garments. They are roomy in design, perfect in workmanship and are made of the best materials.

Our illustrated catalogue contains full information about the A.R.C. line.

Write us today.

Mackinaw Coat

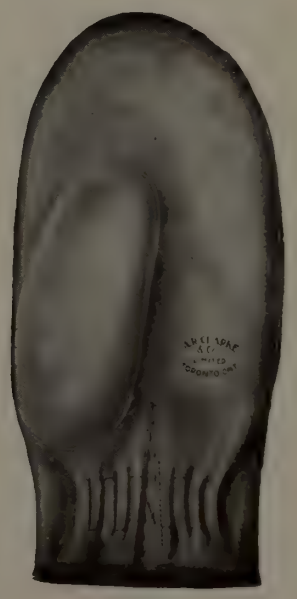
Well tailored from mackinaw cloth and suitable for street wear.

Plymouth Glove

The best made for all kinds of hard wear. Peccary hog leather is a favorite with lumbermen. The toughest and best wearing glove it is possible to make.

Bullhide Moccasins

Are steadily gaining in favor owing to their warmth and wear resisting qualites.



Pullover Mitt

Made in burro, sheepskin, horsehide and peccary hog leathers. Specially adapted for lumbermen, rivermen and miners.

Bain Sleighs for Logging Operations

Famous for their great Capacity and Light Draft

Logging is a severe test of a sleigh.

The best is none too good, even though you may pay considerably more than for one which possibly may appear to be just as good.

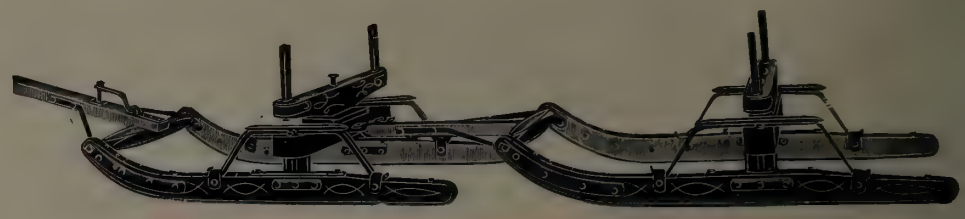
It is only by actual test—the test of time and hard usage—that the difference is apparent, and the increased first cost is forgotten. **The quality is remembered long after the price is forgotten.**

The cross chain couplings allow great flexibility and the hind bob follows in the tracks of the front when turning. Some prefer the short reach for well broken roads, as a sleigh so fitted can be backed same as a wagon.

Swing bunks are an advantage in the bush, as they can be swung parallel with the runners when driving without a load.

Any of these sleighs except the heavy sloop can be fitted with 38, 40 or 42 inch bolsters for general work.

Our new catalogue No. 30 tells all about it and is yours for the asking.



Bain Single Beam Manitoba Bob Sleigh

Steel Shoes; Swing Bunks or Bolsters; Short Reach Coupling; 3 ft. Track. Clearance under Beam 9½ inches.

The Bain North Shore Sloop Sleigh

Steel Shoes; Cross Chain Coupling. 2 ft. 10 in. or 3 ft. Track. Clearance under Beam 7 inches.

The Bain Heavy Sloop Sleigh

Steel Shoes; Short Reach or Cross Chain Coupling; Furnished without Bolsters but with king bolts front and rear; 3 ft. 4 in., 4 ft. 4 in. or 4 ft. 8 in. Track. Clearance under Beam 7 inches.

The Bain Double Beam Manitoba Sleigh

Steel Shoes; Short Reach Coupling; 3 ft. track. Clearance under Beam 9½ inches.

McKinnon Chain Co., St. Catharines, Ont.

Reduce Your Fire Risk by Using Fairbanks-Morse Internal Starter Motors.

No complicated starting apparatus is required as they are controlled by simply closing or opening a line switch. The varying resistance necessary for starting is secured by varying the pressure on a number of carbon discs which form one of the three resistance units. There being no moving contacts there is no chance of sparking and fire risk is practically eliminated as far as your motor is concerned.

The gradually increasing pressure exerted by centrifugal force on the carbon discs gives a very smoothly starting motor.

A simple screw adjustment of the resistance units allows the starting torque to be changed from normal to 200 per cent. full-load running torque if required with a starting current of about one-half that required by the ordinary squirrel cage motor.

Send for Bulletin No. 210.

CALIFORNIA CLSCO REDWOOD

Humboldt Redwood

Humboldt Redwood is cut from the forest of North California. Its qualities suit it to almost every purpose for which lumber may be used. It will not check, is fire repelling, beautifully figured and always clear, free from pitch, easily worked, will not shrink, takes finish equal to mahogany and is in every other way a most desirable wood for all purposes.

CALIFORNIA CLSCO REDWOOD

Its Uses

Among the uses of Humboldt Redwood we mention: Sash, doors, and trim, boats, furniture, toys, pattern lumber, outside building trim, car siding, cooperage, hot bed stock, refrigerators. tanks and silos, buildings, exposed beams, clap boards, lattice, screen doors and windows, theatrical scenery, incubator and beehive stock, turned work and a variety of other uses.

"Figure" one of the more valuable features of Arkansas Soft Pine.

Arkansas Soft Pine

"Not cut with a Broadaxe."

When you are asked to pay a premium for Arkansas Soft Pine — that is to pay more for it than you would have to pay for other kinds of lumber claimed to be the "same thing," — what is your natural inclination?

You pay more because it is worth more.

Turn on the Searchlight

of a trial order and it will reveal this condition:

"Car No. 47,740 arrived and is partially unloaded.

We wish to say this carload is all that you claim for it.

We were beginning to think that all lumber manufactured by the yellow pine people of the south was cut with a broadaxe, but you certainly have **restored our confidence** and we must say that this is the **best manufactured carload of lumber, of** ANY KIND **that we ever had in our yard.**

You will hear from us later about more material."

The buyer making that report **paid a premium of $4 a thousand feet** for the stock. He will be **in the market again for more of the satisfying kind.**

What kind do you handle?

Your Lumber Horse Needs

A talk with the Lumberman of Canada on the modern and sanitary system we have installed to serve your requirements.

FINANCIAL RESPONSIBILITY.—We are in a position this season to supply the lumber trade with the finest heavy horses suitable for camp work. We have shippers in the very best heavy horse district in Western Ontario, who make personal selections and take only the best. Every horse we ship out is guaranteed to be just as represented by us as to age, soundness, weight and quality—there is more than two million dollars behind this guarantee. These horses can be delivered off the incoming cars and transhipped in an hour from our yards.

SERVICE.—Our barn accommodation is up-to-date in every particular and has stabling accommodation for 500 horses. A track is also maintained for exercising horses while on the company's premises.

SANITATION.—Believing that prevention is better than cure, and to give the very best service possible we have this year employed a veterinary surgeon under salary. A daily and most thorough inspection is made by him of the entire barns and in this way the slightest indisposition is noted and the animal suffering immediately removed to the hospital on the grounds. "Safety first" is our motto in this respect.

TRANSPORTATION.—Our premises being directly on the lines of the C. P. R., G. T. R. and C. N. R., our rail facilities are such that we are in a position to ship on an hour's notice, and loading and unloading chutes are located right at the barn doors.

We gladly invite inspection of our entire system. Come and let us show you the most modern and sanitary system in Canada.

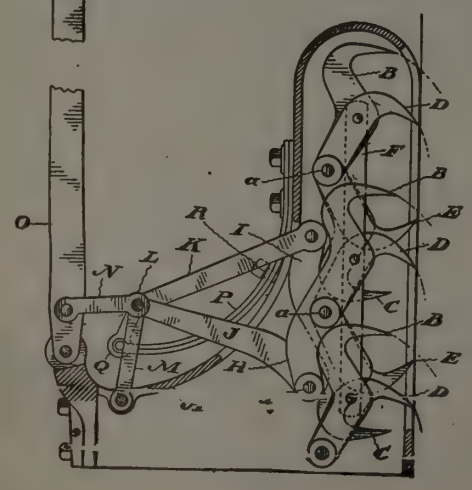
FULL VALUE FOR YOUR MONEY

650 Sets Payette's
Famous Patent Mill-Dogs Sold
Why?

Fig. 1.



Because (1) They will dog with perfect ease and safety in any class of timber.
(2) Will dog just as easily, frozen maple or hardwoods of any description.
(3) Will dog the last board, just as easily as they dogged the first one.
(4) They do not tear the board or stock.
(5) Many other reasons, too numerous to mention here.

Write us for full particulars and booklet on same.

We also manufacture the following High-Grade Saw-Mill Machinery:—New Modern Saw-Mill Carriages, with either three or two head blocks; P. Payette's New Patent Saw-Mill Dog, for use in either winter or summer; P. Payette's Grip-Set Works; Steam Feed Valves, Steam Lifter and Loaders, Valves. Five different class and style of Edgers, for either light or heavy duty. Combined Gang-Circulars and Edgers, or Independent Gang Circulars.
Steam-Canters, Steam Lifters and Loaders, and a general line of saw-mill machinery. Detachable Chain-Sprockets, Castings of Gray-Iron, Semi-Cast Steel, and brass castings for general use.

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale:

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 8-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.

1 Double cylinder steam nigger, right hand.

1 Log Loader for right hand mill.

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.

1 left-hand steam nigger.

1 Log-loader.

1 Endless chain jack ladder with two kickers complete for right and left hand mills.

2 Roger Gang Edgers for 8-in. cants and lumber.

1 Waterous double edger, 6 saws.

2 2-saw trimmers.

1 20-ft. Slash table.

1 16-ft. Revolving Slash Table.

1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works.

1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.

1 Lath Mill with bolter.

2 Lath Trimming Saws.

FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.

1 Automatic Grinding Machine for 8-in. S.C. band saws.

1 Automatic Machine for circular saws.

1 Hand Machine for cut-off saws.

1 Lap Grinder.

1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws.

POWER PLANT

2 Double Duplex, high pressure Water Pumps.

5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.

2 125 h.p. Water Wheels.

1 Upright Engine for sawdust conveyor.

1 10 h.p. Engine.

1 Mitts & Merrell Hog.

1 Wood Machine for 22-in. wood.

1 Wood Machine for 16-in. wood.

1 Edger for ripping dry lumber, installed.

1 Edger for ripping dry lumber, not installed.

1 30 h.p. Generator, 250 volt.

1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

The

Parry Sound Lumber Co.

Limited

26 Ernest Avenue, TORONTO, CANADA

To Buyers of Camp Supplies

You will be requiring groceries for your next season's operations very soon now, and we would like very much to have an opportunity to show you what we can do—we are giving such splendid satisfaction to many buyers that it prompts us to think that we can do the same for you—for instance ask us to send you a sample of our special Camp blend. This tea is giving universal satisfaction, for it is made up to suit the users of it—the hardy river and bush men who want something that has a taste to it—not at all the same fine mellow kind that is suitable for afternoon and pink teas. Try it. It will go farther and please the men better.

Excellent value in Valencias Prunes and Evaporated Peaches—this latter is the only line that will truly take the place of Evaporated Apples of which the market is bare, and so much cheaper—just fancy a fine quality yellow meaty peach at 7½—get in on these.

Call and see us and get acquainted

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3.00.
Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster General for Canada, for transmission as second class matter.

Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

Vol. 34 Toronto, September 1, 1914 No. 17

The Lumber Trade Situation

The single topic of discussion in every lumberman's office in Canada today is the war, and the effect which it is having and is likely to have upon trade conditions. All the other old favorite subjects have been forgotten for the time being. One hears little or nothing about yellow pine or American hemlock. The old real estate boom and its collapse seems to be matter of ancient history. The Mexican war, Irish trouble and the suffragettes, all have been laid aside as subjects of conversation and the war occupies everyone's attention. Every shade of opinion as to the effect upon trade may be heard in the different offices which one visits, depending, we suspect, to a very large extent upon the attitude of the individual's bankers towards his account. And although we hear a great deal about business having come to a standstill, there is, on the other hand a greater amount of hopeful expectation of trade improvement than might be expected at first thought.

A certain wholesaler discussing the matter recently, voiced this opinion very forcibly. He had been out in the country a great deal of late, and, even during the first week of the war, when many people were expecting blue ruin to swallow them up bodily in the course of a few hours, this lumberman was travelling through Ontario, selling a few cars now and then, making enough to pay expenses and profit for his firm, and spending a good deal of his time sizing up the crop situation. "I never saw better crops in Ontario," he said upon his return. "Practically everything is in splendid shape. The oat crop was never better. I do not believe it was ever as good. Many more cattle are to be seen on the farms than in former years. The root crops are looking magnificent. The Ontario farmer in fact, is in a splendid position. Even in ordinary times, he would now be sure of a profitable year, and with the likelihood of a greater demand than ever for his output, on account of the war, I cannot see how he can fail to have the best year he has ever experienced. He will sell his crop and stock at good prices and will be well off."

"But won't he put his money away carefully, instead of spending it in new buildings and improvements?" we asked.

"What if he does? The money is there. If he puts it into the bank instead of spending it upon lumber, building material, implements, etc., the bank will be that much better off, and will be willing all the sooner to lend money to legitimate business. Whichever way you look at it the Ontario farmer this year is going to be a most important factor in assisting business to get back upon a normal basis, and once it is back, no one will remember the hard times which have been gone through."

"Will the banks really loosen up?" was the next question.

"Well, I don't know and nobody else knows, except the managers of the banks, and probably very few of them have a clear idea of it as yet. But what can they do but loosen up if they get the farmers' deposits? They cannot afford to leave their money idle. They must put it into legitimate undertakings, which they have good reason to believe are safe. Why, even today they are doing so, and anyone can see it if he will only look at the matter from a less anxious point of view.

"The banks are doing a great deal to assist those wno are known to be managing their business in a safe manner. What the banks are not doing is encouraging new ventures. I know of a company with an A1 business reputation, who have some newly acquired timber, of which they own every stick. They bought it outright. They asked their bank for a loan to assist them in operating upon this timber next winter and were refused immediately. In ordinary times the bank would have been glad to take on a piece of business of this class, but today the case is different. As a matter of general policy they have decided to reserve their funds for business which is already under way and is doing well. Take our own case for instance. Some time ago we bought some stock from a manufacturer, part of which still remains to be moved. The manufacturer recently found that he needed money, and a few days ago he took our note for $800 to the bank to be discounted. The bank knew that we were cautious and were reducing our stocks as much as possible, also that we had always done a purely legitimate business, avoiding speculation and being content with fair profits on a large volume of sales. They discounted the note without any question. The manufacturer got his money and made whatever payments he was in trouble about. The same thing is going on all over the country. Those firms which have a reputation for sound business methods are not finding much difficulty about getting money. New undertakings cannot be financed, however, and all established ones doing business upon an extensive credit basis are being scrutinized closely by the banks, in just that manner which we would naturally expect under the conditions now prevailing.

"I do not believe there is any way of avoiding the conviction that Canada will come out of this crisis better off than when she entered it. I believe that everything will depend upon ourselves. The other day I was talking with a man who has made a name for himself all over Canada. A man of keen wit, who understands financial and commercial affairs perhaps as well as anyone else in the country. He is a man who has made wealth, has occupied positions of high honor in public life, and is today occupying one of the greatest positions of honor which the country can bestow upon its public servants. He is removed to a large extent from anxiety about trade conditions and takes a bird's-eye view of the situation. We were travelling in the same train and he told me that Canada, from a business point of view, would soon feel the quickening influence of the great demand for its products, which is certain to develop out of the war. He instanced cases already of plants which had been idle, and had recently been obliged to run night and day to fill the sudden demand. There might be saces in which great industries would be shut down, but it would be found that their situation was peculiar and would not reflect upon general conditions very closely. Their sales were mostly in foreign countries which are now at war, and in which the demand had been closed off. But, taking our productions in general, we turned out, in large measure, those classes of food stuffs and manufactured articles which would be urgently required as a result of the war, and we stood to gain, no matter which way we looked at the situation.

"It would be nonsense to say that trade is good today, but I do not expect this condition to last. It will not take long for trade to settle into the new channels, and just as soon as the people get over the feeling of panic which followed the opening of the war, the banks or some person of importance will make a statement to the effect that conditions are sound. You will see a steady improvement from that time onward. I do not believe it will be long before trade conditions are better than they have been for a long time, and as soon as the improvement comes it will obliterate the effects of the long continued depression, which has been hampering trade for the past year or two.

"I hear some people say that they are taking their travellers off the road. They do not expect to be able to pay travelling expenses They are foolish. I am going out on the road again tomorrow. I feel sure that I will get enough orders to make it worth while. There is a fair amount of business going on even today, and I am not going to lie down. I believe that the very time when the other fellow stops going out for business is the best time to make a special effort and try to pick up a few new customers. Have you ever noticed that when a farmer stops raising hogs, that is the time to raise them and make some money. The same thing applies to cattle, dairy products, etc., When the other fellow commences to lie down, there is soon going to be a lot of demand that is not being supplied, and the man who is in the field with the goods gets the cream of the trade. That is why I am going to keep at it. Besides, I don't want the retail man to get nervous. If the travellers all stop calling upon him he will worry more than ever, and think that there must be no business whatever when nobody comes around to try and sell stocks to him.

"I may be wrong, but I think I see great opportunities ahead of the people of Canada today. We must do well. Even in the West, where there has been so much pessimism and depression, things will improve soon. They cannot get any worse. There is no sense in taking a depressed view of the situation as it stands today. The logic of events all point in the other direction. A simple glance into history will substantiate this fact. That is how I feel about the whole situation. Trade has got to improve very soon and the commencement of the improvement will depend upon how quick the majority of the people come to the same point of view and recognize the inevitable."

United States Production of Lumber in 1913

The production of lumber in the United States in 1913 was about three-quarters of a billion board feet less than in 1912, according to official figures just issued by the United States Department of Agriculture. The figures are based upon reports of production which the department obtains yearly from the lumber manufacturers. In 1913, 21,394 mills reported a production of 38,387,009,000 board feet as against 39,158,414,000 feet reported by 29,648 mills in 1912 and 37,003,207,000 feet reported by 28,107 mills in 1911. Although about 8,000 fewer mills reported in 1913 than in 1912, most of those not reporting were of small capacity and the inclusion of their reports would not, it is said, materially increase the total.

The high-water mark in lumber production was set in 1909, when the cut exceeded 44,000,000,000 feet. In 1907 and 1910 the cut was slightly over 40,000,000,000 feet. No other years have come up to the record of the last two years.

The production in 1913 of nearly as much lumber as in 1912 is of special significance in view of the business conditions which have existed in the industry. During the first three months of the year the lumber trade was excellent, but in the second quarter the demand for lumber fell off noticeably. Further weakening in the demand during the summer led to a substantial curtailment of production in the yellow pine and Douglas fir regions. The fall demand did not improve. In general, the year was one of overproduction and slack business in the principal lumber manufacturing regions.

Notwithstanding curtailments in the production of yellow pine and Douglas fir, the reported cut of yellow pine was about seven-tenths of one per cent and of Douglas fir about seven and a half per cent. greater in 1913 than in 1912.. The cut of Douglas fir in 1913 was the largest ever reported, while the 1913 cut of yellow pine was second only to that of 1909. Had not enforced curtailment in the output of these two woods been necessary, the total lumber production of 1913 would undoubtedly have exceeded that of 1912. In fact, had not the cut of white pine, hemlock, spruce, oak, and maple declined in 1913, the increased cut of yellow pine, Douglas fir, cypress, and red gum in that year would have carried the total beyond that for 1912.

The increased cut of certain woods is reflected in the increased production of Washington, Oregon, and the lower Mississippi Valley states, while the decreased cut of other woods is reflected in the decreased production of the northern, central, and Atlantic states. The reported production of 4,592,053,000 feet in Washington in 1913 was the largest ever recorded for that state or any other state. The largest production previously reported by one state was that of 4,311,240,000 feet in 1890 by Michigan.

Of the total reported production of lumber, softwoods contributed 30,302,549,000 feet, board measure, in 1913, as against 30,526,416,000 feet in 1912, and 28,902,388,000 feet in 1911.

About 60 per cent. of the total lumber production in 1913 was sawed by mills cutting 10,000,000 feet and over annually. Some of these mills cut but one kind of wood, such as yellow pine or Douglas fir, but others cut several kinds, as in the case of hemlock and hardwood mills in the lake States. Mills sawing 10,000,000 feet and over annually sawed in 1909, the only other year for which such figures are available, 19,126,123,000 feet, or 43 per cent. of the total quantity of lumber cut in that year.

Merchants Predict Little Increase in Cost of Camp Supplies

Conflicting reports have been received from some of the large lumber manufacturing firms of Eastern Canada, in regard to the probable extent of logging operations in the woods next winter. Some of the largest firms have announced that they will not cut any more logs than absolutely necessary. Others are not making any alterations in their plans, according to present intentions. Still others state that their plans have not been made as yet, and that they are waiting for further information as to the trade outlook, before deciding as to the extent of their operations. The chief consideration in this connection is the probable cost of operations which some manufacturers consider will be much higher than in former years, on account of an expected increase in the cost of feed and provisions. Against this increased cost, if it actually comes into effect, will be the reduced cost of labor, which, according to latest reports will be cheaper and much more plentiful than in former years.

The Canada Lumberman has made extensive inquiry into the situation in connection with the cost of feed and provisions, and the information secured is largely of a nature to indicate that the cost will not be greater than in previous years. The chief items entering into the cost of feeding horses and men are, hay and oats, pork and its products, canned goods, tea, sugar and coffee, evaporated apples, peaches, apricots, prunes, flour, oatmeal, etc. In connection with oats, the situation is perhaps a little disquieting, on account of the fact that the government has commandeered all the oats east of Fort William at present in the elevators. This, however, does not present such a serious situation as might appear at first glance. It means that the government has secured all the oats now in store. This consists of the remainder of last year's crop. The crop of the present year in Ontario is one of the largest ever reported, and is now sure to be a remarkably excellent crop both as to quality and quantity. This stock will all come on the market early in the Fall, and much of it will be available for local consumption. The price of oats or late has gone

up extensively. An important dealer reports that before the declaration of war he was paying 46 and 47 cents per bushel for oats, whereas the last price he paid was 63 cents, but he believes that when this year's crop commences to come upon the market, the prices will fall again, on account of the size and high grade of the crop. Much of our oats already went abroad before the war and dealers do not consider it probable that the additional amount exported during the war will be sufficient to make the prices mount. In fact, the present price is thought to be higher than reasonable, being the result of the finest panicky feeling arising out of the declaration of war. There is no question that oats and hay will be dearer during the war than they would have been if the war were not in existence, but if it were not for the war, it is practically certain that the price of oats would have been lower than in former years. During the war it is now considered likely that the price of oats will remain fairly stationary at about the normal of previous years, after the situation has become a little more settled.

A dealer in hay and oats, summing up the situation so far as supplies and this year's crop of oats are concerned, said to the Canada Lumberman, "The stuff is in the country in sufficient quantities, but the farmers do not want to sell. It is more than likely that they will put it on the market in large quantities, a little later on, and that the price will drop to normal. There is not a heavy crop of hay in Eastern Ontario, but in the western part of the province the crop is fair. They say the government has bought 10,000 tons of hay, and that this will make the price high, but the government may buy such a a quantity and still not affect the market seriously. The stuff is not going out of the country all at once. The government is playing safe, getting its hands on a large quantity so as to be prepared, and much of it may come back on the market before many months. In fact extensive purchases, due to the war, are not likely to have an immediate and lasting affect.

A dealer in provisions, who sends large quantities of pork, etc., to the lumber camps, reports that the price of pork has not advanced, and is not likely to advance, this year. On the other hand hams are already a little higher, because of the enormous consumption at this time of year. The same dealer referring to beans, states that the old crop has all disappeared, and that prices may be higher this winter. Canned goods he says have not advanced, and are not likely to do so.

A large wholesale grocer whose trade extends to many of the lumber camps in Northern Ontario reports that the prices of all camp staples such as prunes, evaporated apples, peaches, apricots, etc., will probably be less than they were last year. Tea, coffee and sugar on the other hand will be higher.

Taking into consideration all the opinions expressed by wholesale dealers in camp supplies, one is justified at present in concluding that there will be some important advances in prices, but that these will be off-set, possibly even more than off-set, by the decline in other lines, and that, from present indications there is very little reason for lumber manufacturers to reduce their woods operations on account of the cost of feed and provisions. One must of course take into consideration the fact that these firms are all interested in seeing their trade continue on a profitable basis, but nevertheless, it is significant that their opinions coincide with those which have been expressed by many other wholesalers and manufacturers in other lines, namely that so soon as the business world gets over the first feeling of panic which naturally possessed it during the early days of the war, there is likely to be a fairly general revival of trade, and a return to much more normal business conditions. In fact, all the merchants who were interviewed expressed the opinion that they would be able to take care of the lumber camps in a manner which would be satisfactory to the men and would enable them to conduct their operations without giving much consideration to the question of the cost of food stuffs.

Editorial Short Lengths for Busy Readers

The staff of the recently organized Lower Ottawa Forest Protective Association, to which all the lumbermen and paper manufacturers in the Ottawa and Gatineau districts now belong, will comprise a manager, three inspectors, and 50 rangers. In order to co-ordinate the efforts of all the agencies interested in protecting the region from fire, the manager of the association has been appointed an officer of the Forest Protection Association branch of Quebec, as well as of the fire inspection department of the Dominion Railway Commission. To reduce the fire hazard as much as possible, close co-operation with the settlers and with the railways operating in the territory will also be sought. The territory to be covered by the fire rangers will be over 10,000 square miles of timber lands in the watersheds of the Gatineau, Lievre, Coulonge and Nation Rivers.

In connection with the trade situation developing out of the European war, a feature of the utmost importance to lumber manufacturers in Canada, particularly those of Ontario, Quebec and the Maritime Provinces is the practically complete stoppage of shipments of timber from Russia to foreign countries, particularly to Great Britain. During recent years, Russia's exports of timber have rapidly increased and they have been responsible for the steady and most disturbing decrease in the exports of wood goods from Canada. Russia's wood goods have to a very large extent supplanted many important Canadian markets abroad. It is reasonable to expect, as a result of the war, that Russia's timber exports will become practically nil for the time being, and that Canadian exporters, if they are able to take advantage of this situation will secure the important advantage to their trade that is of the utmost importance. Last year Russia's timber exports amounted to 7,429,015 tons valued at £17,222,100. These figures compared with 6,862,145 tons valued at £16,049,790 during 1912. Russia's exports of timber goods consisted of logs, baulks, beams, boards, deals and other sawn lumber, pit-props, match and pulp wood, firewood, poles, rickers, etc. Practically all of these products are manufactured and exported heavily by the Canadian lumbermen. Even after the end of the war it is believed that the countries of the old world will require our products for many years, so that these markets, now so completely thrown open to us, are of the greatest possible importance. Canada is apparently in a position to reap a great advantage from this situation.

The Consul-General at Philadelphia, Pa., strikes a warning note when discussing the timber industry of the United States in his annual report, and he draws attention to the rapid exhaustion of wood that is going on throughout the Republic. In the year 1911, he points out, it was estimated that there were 1,540,000,000,000 feet of standing timber in the United States. Fairly accurate estimates assert that the annual cut in the United States of America increases each year by five per cent. In the year 1911 65,000,000,000 feet were cut in the United States, so that in the year 1912 there remained 1,475,000,000,000 feet of standing timber. In the year 1913 there remained 1,400,000,000,000 feet of standing timber. The estimate for the year 1914 is that there will be standing at the end of the year a little over 1,342,000,000,000 feet, and the reduction will thereafter be so rapid that in the year 1918 there will be standing timber aggregating only about 1,036,000,000,000 feet. The number of forest fires reported for the year 1913 amounted to 4,520, nearly twice as many as occurred in 1912. The aggregate loss in timber is estimated at nearly 59,000,000 board feet, valued at $82,000 (about £16,400), and the damage to young growth and foliage is estimated at $110,000, (about £22,000), making the total loss $192,000 (about £38,400). About 18 per cent. of this occurred on private property. Lumber export statistics for 1913 show that there was an increase over 1912 in shipments of nearly all classes of woods from the entire country. Pitch pine showed the greatest gain—nearly 25 per cent.

Much more pulpwood will be cut in the timber limits in Eastern Canada this year by pulp and paper manufacturers in Ottawa and district than was the case a year ago.

The Reader's Viewpoint on Trade Topics

Lumbermen Taking a Hopeful View of the Situation—War Expected to Improve Trade in the Long Run

Although there has been a great reduction in the volume of lumber orders throughout Ontario during the period since the opening of the war, which was naturally to be expected, there is already a feeling among the trade that the future is not nearly so black as it appeared at first glance. In the first place we were probably on the eve of a steady trade improvement when the war started, and the influence of the various conditions that were combining to bring about this improvement, must be felt before long. To these influences there is to be added the fact, now pretty generally recognized, that many lines of industry in Canada will benefit by the demand developing out of the war. Lumber cannot be directly classified among these lines, but it will benefit in the long run. As to the immediate position, many reports already indicate the fair probability of trade revival in a short time, especially if we are fortunate enough to receive encouraging reports as to the progress of the war. The excellent crops of Ontario could not fail, even in ordinary times, to assist in the restoration of business activity. To-day, when it is probable that the farmers will receive enhanced prices for their products, the influence of a good crop should be still greater.

Manufacturers of lumber are holding back their plans for winter logging operations. They do not fear any lack of need for lumber next year, but do fear that money will be exceptionally scarce and that the natural or even excessive demand will be stifled. The present outlook is for a considerable reduction in logging operations.

Predicts a Business Revival Soon

George H. Holt, of the Holt Lumber Company, Chicago, Ill., and of the Holt Timber Company, of Whitestone, Ont., was in Toronto recently and called at the office of the Canada Lumberman. Mr. Holt expressed the opinion that as soon as the people of Canada and the United States got over the temporary commercial and industrial depression brought about by the war, there will probably be a noticeable improvement in the business life of the two countries. In order to bring this about, there would have to be a radical and important readjustment of financial affairs, involving new arrangements for promoting the exchange of currency and credit, so that they may be available for business although flowing through new channels while the old established channels are broken. Mr. Holt believes that readjustments of this sort would soon be made, in fact an important start had already been made by arrangements for having the department of finance at Ottawa act on the part of the Bank of England in this connection. The ultimate result of the war, Mr. Holt said, irrespective of the side which might be victorious, would be that the great producing countries of Canada and the United States would find an enlarged demand for the natural and manufactured products. The great producing centres in Europe would be temporarily out of business. Large amounts of property would be destroyed. The actual fighting population would be in great need of foods, clothing, etc., and in many ways there would be extensive opportunities for Canadians and Americans from a business point of view.

No Panicky Reports from this Quarter

Mr. Chas. O. Maus, eastern representative of the Hyde Lumber Company, South Bend, Indiana, passed through Toronto recently on the way to his home in Atlantic City, N.J., accompanied by Mrs. Hyde and family, who had spent the summer at Southampton, Ont. It was a pleasure to hear Mr. Maus' views of trade conditions, as they were in decided contrast to many other views which one may hear every day at present. "Canada and the United States," said Mr. Maus, "have nothing to fear as to the economic outcome of the present war. The eyes of the world are upon these two countries, and as a result of the war, it is unquestionable that the trade operations of these two countries will be enormously increased. Just at present people are a little bit panicky, but in the very near future you will see an altogether different state of affairs. I have been doing some very nice business in Ontario recently, and have sent home a number of good orders for quarter cut and plain white oak."

Expect the War to Improve Lumber Trade

Editor Canada Lumberman: Bathurst, N.B., Aug. 21.

We find trade has been a little quiet since the declaration of war, but we are now beginning to get a good many inquiries and some new orders are coming in. In fact, in the last week, we find a decided change for the better and it looks to us as though we would have a good fall and winter's trade. There is no doubt at all but what all the food products of Canada and the United States will be wanted by the countries engaged by the war, and also, they will want many of our manufactured goods. This is bound to stimulate trade in both the United States and Canada and we believe that lumber will share in the demand and be an active factor.—The Bathurst Lumber Company.

Foresee a Rapid Business Improvement

Editor Canada Lumberman: Ottawa, Ont., Aug. 22.

While it may be a little early to predict what effect the European war will have on Canadian commerce, the writer firmly believes that Canadian tradesmen and business men should settle down and endeavor to secure part of the foreign trade that was held by some of the nations now at war.

For the time being, this great calamity has almost paralyzed trade in this country, but we believe that Canadians are sane enough to grasp the situation and, in a very short time, we think that business will improve very rapidly, particularly, as commerce on the high seas is not likely to be affected.

Some of the smaller countries that have been importing considerably from Europe, particularly South America and the West Indies may find it a little difficult to finance, but we believe that it will be arranged satisfactorily before a great while.

Of course, it is not necessary to single out the lumber business, as we find it is in about the same position as most of the other industries.—Shepard & Morse Lumber Company.

A Good Crop Certain to Help Trade

Editor Canada Lumerman: Hamilton, Ont., Aug. 17.

The lumber situation to-day is in a very critical state, more so than a month ago.

It seems to us that the declaration of war helps a certain line of business that the country makes a bigger demand of and fluctuates the prices. In the lumber line, there is nothing like this as no lumber is required for war. Exports are cut off, money is tightened up, building operations cease, carpenters and manufacturers have to shut down their business. In fact, American lumber is not coming into Canada. The war has stopped this as there is no demand for any class of lumber. Several weeks ago, Americans had the Canadian trade in hand both in Michigan and Wisconsin hemlock and yellow pine. To-day there is no trade, so consequently the Americans do not hurt the Canadian Trade very much.

I would suggest that now is the time for Canadians to regulate their cuts, etc., and hold the Canadian trade, as no doubt it cannot get any worse than it is at the present time, and is bound to improve. The only thing that will save the situation, if war continues, is a bumper crop in the west.

The information we have from Michigan firms is that prices are firm and will probably stay firm for some time, as, in all the mills in northern Michigan there were only nine million feet on sticks and most of it is green.—The Long Lumber Company.

Finds Trade Depressed But Hopes for the Best

Editor Canada Lumberman: Marmora, Ont., Aug. 20.

The past winter and summer have been the most puzzling in the experience of the writer. During the winter and spring there were many indications and good prospects of steady improvement in business, but so far as we can judge this has not materialized. While general local trade has been very good the wholesale trade has been very quiet and the declaration of war has supplied the finishing touches. Hardwood stock has been particularly dull, and, we notice by the paper, that numbers of the factories using this class of stock are either closed down altogether, or running on part time. The export trade also has been entirely cut off, except to the United States. The outlook does not appear to us to be very promising. We have heard of one or two instances of price cutting, but we do not believe that this has been very general so far. It may be possible that the spruce trade will be good on account of the demand for paper, but we doubt very much whether there will be any marked improvement in the hemlock, pine and hardwood markets for some time, unless the war comes to an unexpectedly successful termination. We do not think that lumbering operations will be carried on to more than a

very limited extent throughout this district during the coming winter. Wages will probably be considerably lower and the cost of supplies is almost sure to be much higher. Altogether we are participating a very dull winter. We sincerely hope that things may take a turn for the better.—The Pearce Company, Limited.

Looking for Steady Trade and Improvement

Editor Canada Lumberman: Ottawa, Ont., August 20.

We find that business has been affected to some extent by the uncertainty in the minds of retailers as to how the war will affect business. We believe that this uncertainty will gradually give way to a realization of the fact that the ultimate effect of the war will be beneficial to Canadian trade. It can scarcely be otherwise, when one considers that manufacturing is practically paralyzed on the continent, and that this country and the United States are the only two countries in a position to supply lumber and other manufactured products without interruption during the war. We look for a fair trade next spring and we also expect that our present prices will be substantially maintained.—Devon Lumber Company, Limited.

Canadian Lumber Trade Should Benefit

Editor Canada Lumberman: Toronto, Ont., Aug. 22.

Our opinion in regard to the effect of the European war upon the lumber trade can only be expressed with reserve and hesitation under the present uncertain conditions. However, from our experience of the trade from coast to coast, as well as in the old world, we find that the immediate effect is the general easing up of the building trade, and a temporary shutting down of manufacturing plants, also the placing of other plants on a half-time schedule. Orders for future deliveries are delayed and some orders that were placed for definite shipment are cancelled.

There can be no doubt however, that the enormous destruction and waste of property and material, and the almost complete cessation of constructive business in the old world through this disastrous war must mean before long a great demand for our lumber, and even for the finished product of our lumber to replace and re-build all that has been destroyed by this great devastation, and Canada should benefit enormously in the next few years.—The Siemon Company, Limited.

May Benefit Trade in the Long Run

Editor Canada Lumberman: Ottawa, Ont., Aug. 20.

It is too early as yet to venture any definite opinion as to the effect of the war on the lumber trade. In a general way, my feelings are about in line with what you say in your letter is the expression of a great many of the lumbermen, but further than this I do not care to go.—J. R. Booth.

Business Sure to Improve After the War

Editor Canada Lumberman: Huntsville, Ont., Aug. 21.

The unsettled condition in Eastern Europe for the past couple of years interfered seriously with all lines of business in Canada, the lumber business suffering with other lines. The dread of the present war has been the cause of the financial stringency which Canada has felt so keenly for the past eighteen months. Just at present people are somewhat panic stricken but we feel certain that, when the present conflict in Europe ceases, there will be much better demand for lumber, as well as other commodities, than there has been for some years. The cities in Canada require many more houses than there are in them at present. Lack of funds has been the real cause for any depression that we have felt in the lumber business. As soon as the war is over, lumber will be required and we feel satisfied that business will improve greatly in the lumber line.—Muskoka Wood Manufacturing Company, Limited.

Cooperage Trade Expecting a Good Season

Reports from throughout the country are that the apples are coming through in good condition, especially in the Eastern States. While the dry weather in June caused considerable dropping, the trees were really overloaded, and this dropping has only helped the quality and still left plenty of apples on the trees.

The July rains almost assured the crop, and we expect that there will be more than an average crop in most of the States and in Canada. The demand for apple barrel stock is beginning to spring up again, as the coopers have used up the bulk of the stock they had to make store barrels and are now beginning to figure for the fall trade.

There is very little change in prices. Heading and hoops still continue low, but heading is stiffening up a little. We do not, however, expect very much change in prices for a short time. The general trade throughout the country is about normal for this season of the year. Legislation causes some uneasiness, and until this settles down the country will not get back to its booming condition of three years ago.

Every indication points to a good fall and winter trade, and if confidence throughout the country is restored, with the prospects for the best crops that there have been for years in the United States and Canada, everything in the way of cooperage stock will be required to take care of the trade.

The demand for tight barrell stock in some lines is very good. The whiskey staves and oils are a little dull, but backed and undressed staves are in good demand, and, as the production last winter was light, we are afraid there is going to be a shortage before next spring. However, if there is good weather during the fall, we have no doubt considerable rived stock will be produced this year.—Sutherland-Innes Company, Chatham, Ont.

May Greatly Improve Trade

Editor Canada Lumberman: Montreal, Que., Aug. 20.

Replying to your inquiry as to the effect of the war upon the lumber trade, in the first place the present effect is the curtailment of both local and export trade.

The effect in future will altogether depend upon the duration and result of the present European trouble. I am satisfied that if the war does not last too long, the lumber trade in this country should be greatly improved.

I do not think it possible for anyone to estimate the effect of the present trouble on the affairs of the country. We, like many others, hope for the best.—The McLennen Lumber Company, Limited.

Will Reduce Hardwood Output

Editor Canada Lumberman: Toronto, Aug. 24.

It is a little early to advise as yet as to the effect of the European war on the lumber business. I am of the opinion however that the sale of lumber will be considerably reduced, due to the stoppage of building operations. Cheaper ends however will, I feel, continue in good demand. The sale of hardwood will decrease, due to the cessation of the manufacture of furniture, and the limited export. It is our intention, in view of the prevailing conditions not to operate for hardwood this winter but we will continue to operate for hemlock and a small amount of pine.—A. Greigg, General Manager, Standard Chemical, Iron & Lumber Company.

Ultimate Effect of War Beneficial to Business

Editor Canada Lumberman: Renfrew, Aug. 22.

So far, the only effect the war has had upon our lumber trade is to stop shipment of about 250,000 ft. of elm which was going to export. Otherwise, our trade at Lancaster, Ont., has not been affected and we concur that the ultimate effect on business will be beneficial to the lumber trade, as we believe the active participation of Canada in the war will increase the political affiliations with both the Empire to which we belong and with the allied countries, and a beneficial sentiment is bound to prevail in the future. At the close of the war, we expect to see all industries in Canada experience a great revival and much prosperity. This will assuredly assist the lumber trade and we would like to see all firms engaged in the trade remain firm to this belief.—St. Lawrence Lumber & Box Company.

A Few of New Brunswick's Problems

Mr. J. Fraser Gregory, of St. John, N.B., recently gave evidence before the Dominion's Royal Commission on Imperial Trade Relations. Mr. Gregory's statements were entirely confined to matters relating to the timber trade. He stated that good marketable timber could be grown after twelve or fifteen years on a district which had been burned over, although it took about 35 years for the timber to grow up to the required size, from the sapling stage. The seeds of birch trees persisted in reproducing birch timber in spite of fire and other serious obstacles. Birch seeds had probably been established in New Brunswick previous to Confederation. Mr. Gregory expressed the opinion that the system in Quebec Province of issuing perpetual timber leases with restrictions against settlement was preferable to the system existing in New Brunswick. He also referred to the driving difficulties on the St. John River, which had arisen under the Ashburton Treaty, providing for the keeping open of the river for all time. He described also the encroachment made upon the river by an American firm which had built a boom. Although an International Commission had been working up this matter for eight years, no apparent result had been obtained. He claimed that the boom interfered with the legitimate rights of the New Brunswick license holders.

Busy Box and Lumber Manufacturers

Rapid Development of The Wilson Box Company, St. John, N. B., who Operate Plants at Fairville and Westfield—Equipment of the Mills

In 1910, foreseeing that St. John, N.B., was some day in the near future to become the "Liverpool of America," Alex. Wilson, who had had at that time some ten years experience in managing a box plant induced some of the leading business men of that enterprising "City of the Loyalists" by the sea to become associated with him in forming a company to operate a box plant and saw mill from which to draw raw material at first hand. Mr. Wilson's former experience as a bank man, he having been for thirteen years in the Bank of Nova Scotia, stood him in good stead, with the result that the capital was practically all subscribed for locally, everybody getting in on the ground floor, the stock being all sold at par with no "water" or promotion money attached.

The president of the company is Mr. T. H. Estabrooks, who is one of the largest and most successful tea importers in Canada, and his firm is a very valuable customer of the Box Company, requiring an ever increasing quantity of "Red Rose" tea cases.

The Vice-president is Mr. Stanley E. Elkin, the head of the Maritime Nail Company, Limited, whose products find their way all over Eastern Canada and a large portion of Western Canada also.

The Managing Director and Secretary-Treasurer is Mr. Alex. Wilson, a native born Scotchman, from Banffshire, who promoted the company, and who has governed its affairs so ably that it is now doing a first class business and is producing boxes and shooks of a quality and manufacture that is hard to beat. The slogan of the company is "Quality Counts."

Sawmill at Westfield, N. B., of Wilson Box Co., Limited, St. John, N. B.

The other directors are S. Y. Wilson, of A. Wilson & Son, Fish Merchants, Halifax, N.S., recognized as one of the most expert fish men on the Atlantic seaboard, and John Galey, who is superintendent of the box factory and who has been in the practical end of box making all his life. The products of A. Wilson & Son, such as finnan haddies, boneless cod, etc., find their way to the market in boxes made by the Wilson Box Company.

Besides supplying a large nailed-up city trade in cases and boxes of all kinds The Wilson Box Company, Limited, do a large box shook business all over the Maritime Provinces, and also find a market for some of their shooks in Quebec and Ontario in addition to exporting them to British West Indies and other countries.

The company's box factory is located at Fairville, N.B., a suburb of St. John, and is one of the largest box factories east of Montreal, employing 65 men the year round. It is situated on the main line of the C. P. R. and within easy team distance of St. John proper. Their extensive lumber yards covering 8 acres of ground are also situated at Fairville.

Among the machines in their factory are the following: 3 planers, 2 band resaws, 6 fitting saws, 3 cut-off saws, 2 matchers, 3 nailing machines, 1 sander, 1 lock-cornering machine, 1 assembling machine, 1 equalizer, 1 jointer, 1 rotary saw especially gotten up for cutting eight-foot logs, 1 bolter, and 1 lath machine.

With a view to turning all their by-products to advantage, the company bundle their edgings, finding a ready sale for all they make to the city trade. They steam on sawdust, shavings and short cuttings.

While most of their lumber comes from their own saw mills they also buy a considerable amount from outside sources. The capacity of the box factory is 4 million superficial feet per year.

The Wilson Box Company's main saw mill is situated on the St. John River, ten miles from their box factory, on the C. P. R. The St. John River is 450 miles long and the territory bordering it contains a vast supply of logs. The sawmill contains a rotary saw, resaw, edger, planer, and lath machine, the lumber being loaded direct onto cars from the saws, when it is shunted to their box factory lumber yards to be stuck out to dry. At this sawmill they also saw a large quantity of special laths, etc., used at their box factory. Here all edgings are bundled and sold in carload lots. The capacity of this mill is 3 million superficial feet, mostly spruce, most of which finds its way to the box factory in the shape of rough edged boards although all superior quality spruce and pine is edged and saved out. The company employ 25 men at this plant.

They also have a portable rotary sawmill at Bonny River, Charlotte Co., N.B., employing 20 men, where they cut about a million superficial feet of logs which are sawn into box lumber and railed to their box factory.

Box plant at Fairville, N. B., of Wilson Box Co., Limited, St. John, N. B.

A newspaper report recently stated that the large sawmills belonging to the Shevlin-Clarke Company at Fort Frances, Ontario, had closed down and were to be dismantled and sold. The report, which was entirely in error, stated also that the European war was responsible for the closing of the mill. Mr. J. A. Mathieu, M.P.P., manager of the company, reports that the statement had no truth in it whatever. The mill will continue to operate day and night as usual until the end of the season. Moreover, the war has made no difference in the company's plans for operating the mills next year, and it will not interfere with the company's logging operations in the woods during the approaching winter. The west and the south, which are the important mrakets for this mill, still require large quantities of lumber, and so long as lumber is used for buildin gpurposes, a more or less active demand will furnish the company with good reason for manufacturing. The mills of the Shevlin-Clarke Company cut nearly one million feet per day.

Five Per Cent. Freight Rate Decision

The Interstate Commerce Commission of the United States recently gave its decision in the application of the railway companies for an advance of 5 per cent. in freight rates. The decision grants an increase of 5 per cent. in the Central Freight Association territory only, but with a number of exceptions. This territory lies between the Mississippi River and Pittsburg and Buffalo. In a list of commodities upon which the commission will not allow any advance in rates lumber does not appear. Inquiry which has been made, brings out the fact that the commission intended to allow the lumber rates in the Central Freight Association territory to be increased.

About thirty-five per cent. of the total commodities in Central territory will receive no advance. It is estimated that the income for the railroads in this territory will be increased about one and one-half per cent., or something more than $10,000,000 a year.

While the eastern and New England lines do not share directly in the advance, they will indirectly profit by it because several of the lines have large mileage in Central territory.

It is believed that in some instances the advanced rates can be put into effect within a month, but in other cases several months will be needed to prepare schedules and put them in operation. Many complicated matters must first be worked out.

The commission discussed many points other than a direct advance in freight rates. Along some lines a general overhauling of business methods was advised, thereby to cut down expense, or increase revenue, or both. In some instances passenger rates need adjusting, in order that this service may be carried on at a profit. The commission expressed its strong disapproval of the policy of increasing freight rates for the purpose of making up the deficiency of passenger service.

The commission recommends that the practice of granting free transportation of passengers and private cars should be further restricted by the carriers. It is pointed out that the private car privilege is greatly abused, and if that extravagance were properly curbed, the roads would be in less pressing need of revenue for other purposes. Eighty-eight roads, for which statistics were compiled, hauled private cars at a cost of nearly three-quarters of a million dollars a year.

The commission calls attention to the fact that fuel, next to wages, is the largest item in operating expenses; that the railroads in the United States report their aggregate fuel cost to be about $250,000,000 a year, and that the cost of coal is increasing, and adds: "Much has been done in recent years by means of mechanical devices and otherwise to reduce fuel costs . . . . but it has been demonstrated clearly that by knowledge and care on the part of employees and the management much greater saving can be made."

The commission recommends a careful review of methods of increasing freight car efficiency, saying:

"Taking the average of all roads in official classification territory for the whole year, the time a car is moving in trains probably does not exceed three days out of thirty, and the car is under load two out of those three days. Furthermore, the cars under load are loaded on an average to only about fifty-eight per cent. of their capacity. The percentages of empty movement and of waste capacity in moving cars have both grown."

The forest areas of the island of Cuba are mainly in the Santiago, and although during the last decade immense areas have been cleared for cultivation it is estimated that about one-seventh of the cultivable area of Camaguey and Oriente Provinces yet remains in primeval forests. While undoubtedly there still exists in the Cuban forests much valuable timber, they have been depleted to a great extent of those valuable woods for which there is a demand in foreign markets, especially cedar and mahogany. The government exercises control over the forests, whether of public or private ownership, and no timber can be cut for any purpose without a permit being obtained from the chief of the bureau of forestry of the district in which the timber is located. Notwithstanding the stringent laws and regulations adopted to prevent the cutting of timber on lands by persons who have no right thereto, the forests on lands belonging to the State have been robbed and in a great measure stripped of their most valuable products. Much of the land classified as forest or timberland has long since been stripped of all timber of marketable value, and at the present rate of extraction with no effort at reforestation, it will not be long until no merchantable timber will be found in the island. There were exported from the district to the United States during the calendar year 1913 mahogany logs containing in the aggregate 4,063,280 board feet, the declared value of which was $243,814, and cedar logs containing 6,750,000 feet, valued at $371,250. The declared value of all other hardwoods in the rough was $47,291. There were also exported to the United States cedar strips used for the manufacture of cigar boxes, valued at $102,254, and 685 tons of lignum-vitae worth $18,181.

Cheap Lumber Not Profitable

Some day, in order to create more jobs for political workers, the government may attempt to gather statistics on the several classes of foolishness, and the number of persons found in each class. The task would last forever, but it is a safe bet that as the figures began to be tabulated, "bargain hunting" would be a close runner for first place.

Man will laugh, or sneer, according to the nature of the beast, at woman for shopping at the "bargain" counter, and then immediately turn around and do the same thing, only do it worse or better; for the woman shopper examines, to some extent, what she buys, while the man buys something he does not see "at a price" and takes a chance that the "pig in the bag" will prove to be in good condition.

If you want a specific material, take lumber. Do you buyers of this material really know how all the bargains that you got averaged up? Is the lumber you buy, at the price you pay, the best investment for your particular operations? I am not qualified to be the judge of your shrewdness in buying, so I'll tell you a few things that I have observed and let you pass judgment on yourself.

Just to encourage you in keeping up your bargain hunting, because I know you will not give it up, I will cite a recent instance that worked to the benefit of the buyer. It happened that a mahogany salesman, of a bonehead type, had booked a substantial order for his product with a manufacturer and, as he was on the point of leaving, casually asked if there was anything more that was required. He was informed that there was, but that it was out of his line. Inquiry, however, brought out the fact that some black walnut was needed, and it so happened that this salesman knew of a small concern that had about two carloads of this material that it had been holding for some time, because the owner knew of no market for it, and did not have the initiative to find one. Now, this salesman volunteered to handle the transaction and get the walnut to the consumer for what it would cost him. The deal was put through and, as a matter of record, the furniture man got a good quality of black walnut at about $10 below the standard market price. That was a "good boy" which might just as easily have been a bad one. Incidentally, you are welcome to your own opinion in regard to the foolishness of the salesman.

Now let us jump to a city where lots of good furniture is made. Some years ago a man owned a small mill just outside the city, and cut more or less lumber from timber obtained from the surrounding farms. While his supply lasted he sold it to some of the local furniture manufacturers, who thought they were shrewd in buying from him at a price lower than the regular lumbermen were charging for the "same" grade of lumber.

This man had all the appearance of a country "jay" and let it not be recorded against these "wise ones" that they were taken in by him, because other "wise ones" in other places have found that the apparent fool was fooling them all the time. Well, in the course of time this man found that the demand was exceeding his supply and he began making demands on the regular lumber yards for some material. His habit was to mix grades and sell them for a high grade. He was such a good "mixer" that hesold the "wise" buyers lumber at from $5 to $8 a thousand more than they would have had to pay for the same grade of lumber had they purchased it from the regular manufacturers.

He had such a trade that for several years after his own supply was exhausted, he was selling to his customers "at a price." He was in the habit of getting a dray, that had no name on it, in the city and paying the driver to haul the lumber from the yard where he purchased it to within a few blocks of the location of his customer. Then he would give the driver a quarter to pass away the time in a near-by saloon while he delivered the lumber, and the wonderfully shrewd buyers of bargains were several years finding out that they were being fooled by the country man in overalls and cowhide boots.

Similar things are happening in every furniture manufacturing centre in the country, and if every "bargain" purchase of lumber could be traced to its consumption in the factory it is a safe bet that there would be more buying for quality and less for price.

There is, for example, a factory in New England which was buying what it considered good material for its operations at $22 to $30 per thousand feet. After an investigation by an efficiency or industrial engineer and following some of his suggestions for a time, it was found that it was more profitable to pay $35 to $45, and in some instances as high as $65 per thousand feet than it was to use the kind of material that it had been the habit to use.

In the use of the cheaper material the waste was from 40 to 65 per cent., while in the higher priced material the waste ran from 12 to 28 per cent., to say nothing of the difference in the time taken in handling operations to work up the material.

We might cite more instances, but why waste time? The probabilities are that we will always have with us the "bargain hunters," those people who are careful not to give anything away themselves, yet are foolish enough to think that they can get something for nothing so far as the other fellow is concerned.

B. C. Statistics for July

During the month of July the timber sales completed by the British Columbia Forest Branch covered 10,553,188 feet b.m., 1,400 cords, and 7,500 lineal feet. The estimated total value was $18,322.97.

The total amount of forest revenue received by the Branch during the month of July was $219,491.05, made up as follows:—

Timber license fees	$166,024.36
Timber license transfer fees	310.00
Timber license penalty fees	1,170.00
Timber lease rentals	6,407.47
Timber lease transfer fees	5.00
Timber mark fees	54.00
Handloggers license fees	825.00
Scaling fees	2,991.29
Scaling expenses	174.36
Timber Royalty	30,155.46
Timber tax	3,179.26
Trespass and penalties	535.91
Timber bonus	6,635.39
Exchange	2.79
Copies of documents	66.23
Timber sales rentals	594.24
Timber sales, cruising	281.20
Timber sales, advertising	74.32
Interest	4.77
	$219,491.05
Collection for the Forest Protection Fund from timber licenses. lessees, etc.	14,062.60
Contributed by Provincial Government	14,062.60
	$28,125.20

Forest protection expenditure during month of July was $45.990.85.

During the month of July the quantity of timber scaled and exported in all districts was as follows:—

Forests District	Sawlogs No. of feet B. M.	Piles and poles No. of Lineal Feet	Rly. Ties Shingle Bolts and Cordwood No. of cords.
Vancouver	53,543.732	260,408	9,136
Vancouver exported	3,362,541	174,985	....
Island	11,170,978	77,608	9,706
Island exported	832,874	5,920	....
Kamloops	16,883	.....	342
Cranbrook	24,006,324	62,670	7,826
Nelson	8,765,779	79,847	5,874
Vernon	2,682,895	51,623	1,437
Prince Rupert	1,198,198	31,182	1,286
Lillooet	.....	389	78
S. Fort George	1,598,748	38,020	1,789
Hazelton	.....	.....	....
Tete Jaune Cache	.....	.....	....
Total scaled all districts.	102,983,537	601,747	37,474
Total exported all districts	4,195,415	180,905	....

The Pulp and Paper Situation

An important effect of the war, which is of much interest to the pulp and paper industry in Canada is the fact that the newspapers of the United States were immediately faced with a threatened shortage of supplies of newsprint paper. This resulted in large rush orders for Canadian newsprint. Another result following closely upon the first was an extensive advance of the price of sulphite pulp. Much of the sulphite used by American paper makers is secured from Sweden and Germany, and as these sources of supply have been cut off the American consumers immediately turned to Canada for stock.

Canadian paper mills are pretty well fixed in this regard in as much as they almost all manufacture their own pulp. In fact, several of the Canadian mills export quite a surplus; and thus they should find an unusually fruitful source of income just now.

In this connection the amount of pulp exported annually by Canada should be of interest. In the month of March last Canada exported to all countries some $673,983 worth of wood pulp compared with $512,423 same month last year. During the twelve months ending March 31st, 1914, Canada's wood pulp exports were valued at $6,364,824, compared with $5,509,544 in preceding year. Of this total the United Kingdom took $1,167,882, United States $4,913,634, and other countries, $283,308. From which it will be seen that our chief wood pulp purchaser is the United States.

Just how the tying up of foreign markets will affect our heaviest buyer of pulp, can be gleaned from the fact that in May last the United States imported from Germany some 16,396,163 pounds of wood pulp valued at $285,732; from Norway, 14,641,327 pounds valued at $300,339; from Sweden, 12,611,044 pounds valued at $225,336; from Canada, 43,224,037 pounds valued at $518,312; and other countries, 2,341,614 pounds valued at $44,137. Or, out of a total of 89,214,185 tons of pulp valued at $1,373,856 imported into the United States in May last Canada sent nearly fifty per cent. Of the remaining $855,544 pulp, Germany, Norway and Sweden are the chief exporters. German commerce is at present almost completely tied up; and Norway and Sweden's shipping are not in a much better shape. So that if the United States' pulp demands are to be satisfied at all she must fall back upon Canada for practically her entire supply.

The importance of larger markets for Canadian pulp in the States, cannot be too much emphasized. Of recent years Canada's wood pulp has been growing in popularity in the States even to the exclusion of some of the cheaper foreign products. This is exemplified by the following table showing pulp importations into the United States during the month of May this year and last:—

May Importations in United States

	1913.	1914.
Germany	$215,848	$285,732
Norway	480,201	300,339
Sweden	307,057	225,336
Canada	344,731	518,312
Other Countries	19,957	44,137
Total	$1,367,794	$1,373,856

For the eleven months ended May 31, 1914, the importations totalled 1,031,135,087 lbs., valued at $15,387,411, which is compared with the corresponding periods of 1913 and 1912, respectively, as follows:—1,053,374,397 lbs., valued at $15,102,158, and 981,662,926 lbs. valued at $13,052,247. In each case Canada's share was greatly in excess of that of any other country—she sent in during the eleven months in each year as follows:—

Canadian Pulp in United States

11 Months	Lbs.	Valued at
1914	474,615,105	$5,328,780
1913	431,749,555	4,607,928
1912	429,550,915	4,353,655

Importations for the eleven months period of 1914 recorded Sweden second with 238,875,852 lbs. valued at $3,935,355; Norway, third, with 164,781,015 lbs., valued at $3,365,172, and Germany fourth, with 135,743,028 lbs., valued at $2,447,193. The remaining importations consisting of 17,120,107 lbs., valued at $301,911, came from several other smaller exporting countries.

The 89 million odd pounds of wood pulp brought in during May, 1914, consisted of 25,846,630 lbs. of mechanically ground wood valued at $191,219; 45,898,527 lbs., of chemically unbleached valued at $775,269; and 17,469,028 lbs. of chemical bleached, valued at $407,368. All of these importations came in free of duty. Similar figures for the eleven months ended May 31, 1914, are:—

Kinds of Pulp Imported

	Lbs.	Valued at...
Mechanically ground wood	323,529,678	$2,497,783
Chemical unbleached	546,408,621	9,110,592
Chemical bleached	161,196,788	3,769,036
Total	1,031,135,087	$15,378,411

The situation in connection with the production of pulp is giving a great deal of anxiety to the paper trade in the United States. The Wall Street Journal, in a recent issue, states that the trade is facing a shortage of pulp, estimated at 1,000 tons a day, as a result of the war in Europe. Advances of approximately 20 per cent. during a period of 3 or 4 days, were recorded in the prices of sulphite pulp, ground wood pulp and other grades. Sulphite pulp was then selling at from $46 to $48 per ton, against $38 to $40 before the war, while ground wood pulp was quoted at $22 to $25, against $19 to $20. An official of the Union Bag and Paper Company, commenting upon the situation said:—"It is estimated that the shortage of 1,000 tons a day can be partially made up by speeding up the mills of this country and Canada. Something like 400 tons a day, it is thought, can be added in this way. Our export business to South America has picked up since the shutting off of European supplies, which of course increases the deficiency in the United States. Aside from wood pulp, however, other articles are imported from Europe, which are necessary in the manufacture of paper. One of these, for instance, is dyes. The situation, therefore, is not altogether as clear as it might seem."

Imports of wood pulp into the United States have been as follows, in pounds:

	May, 1914	11 Mos. 1914	11 Mos. 1914
Germany	16,396,163	135,743,028	151,481,033
Norway	14,641,327	164,781,015	189,951,459
Sweden	12,611,044	238,875,832	283,916,347

Canada ... ...:	43,224,037	474,615,105	467,444,800
Other countries ... :.	2,341,614	17,120,107	37,298,387
Total	89,214,185	1,031,135,087	1,130,092,026

The increase in the consumption of newsprint by newspapers is estimated at between 20 per cent. and 25 per cent. during the last few weeks and there is a great deal of uncertainty as to whether the manufacturers will be able to meet the demand. Export prices of newsprint have been advanced approximately 25 per cent. but there has as yet been no increase to domestic consumers. The cutting off of shipments of sulphate, sulphite, and other grades of wood pulp from Europe, it is thought, will first affect the production of wrapping paper, bag paper, and similar grades in this country, and that the newsprint manufacturers will not immediately suffer from the shortage. Furthermore, the United States has a considerable export trade in newsprint, chiefly to Great Britain, Canada, South America and Australia. The curtailing of these shipments will tend to conserve the supply available for home use.

Protecting Domestic Trade

There is a disposition among newsprint manufacturers to protect the domestic trade. Arthur E. Wright, vice-president and sales manager of the International Paper Company, said: "The newsprint manufacturers of America were never better prepared to take care of a situation such as the present one. A print paper famine in this country is extremely unlikely and would come only as a result of a prolonged war. There is not the slightest indication of a desire on the part of the paper manufacturers to take any unfair advantage of existing conditions. The International Paper Company's machines have a normal capacity of 1,500 tons of print paper a day. It is our practice during the summer months to accumulate a reserve stock of paper large enough to take care of the demand during the late fall and winter months, over and above what is produced in that period. We have a very satisfactory reserve stock on hand to-day. We are shipping some paper abroad as is our usual custom. We will send abroad only such tonnage as we can conveniently spare."

Sixth Session of Pacific Logging Congress

The sixth annual session of the Pacific Logging Congress was held at Bellingham, Wash., from August 27 to August 29 and was very largely attended. A number of excellent addresses were delivered, which were of a very practical and interesting nature. The secretary, in his annual report, recorded steady forward steps in the States of California, Idaho, Montana, Oregon and Washington and in the Province of British Columbia, towards providing educational instruction in logging engineering at the various colleges which were attempting to provide special courses in logging engineering. There had been a sincere appreciation by the faculties of these colleges of the fact that teaching theoretically would never in itself equip young men adequately for the arduous duties of modern logging practice. It was, in fact, almost hopeless for a young man without practical training even to attempt to offer his services in such an intensely practical field of human endeavor. It was the great object of the Congress to help direct the form of instruction in order that young men might be trained along lines that would insure them remunerative and certain employment after graduation.

The secretary then outlined the progress that had been made in the various States along this line. Referring to British Columbia, he said that the logging and lumber interests were co-operating with the moving spirits of the new university to be established at Point Grey, and it was anticipated that adequate provision would be made for teaching forestry and logging engineering at the new British Columbia University. The lumber industry of British Columbia had always been loyal supporters of the cause of logging engineering.

It was absolutely essential that the logging and lumbering interests should co-operate with the educational institutions in order that the most practical form of forestry and logging engineering instruction should be provided. The schools had shown the most earnest desire to help to shape their courses along practical lines, and it only required the advice and support of the lumber industry to render these schools successfully effective in turning out young men fit for logging engineering work. It was most pleasing to note the steady advance that had been made in the progress of forestry instruction, which could be regarded as an omen of good-will between the various educational institutions and the logging Congress in its efforts to standardize the profession of logging engineering. The secretary advised the members of the Congress to visit the colleges occasionally and to ask the faculties to visit their camps. He suggested that, in order to insure the highest possible efficiency in a logging engineering school, it might become advisable for the various States and the Province of British Columbia to join forces and create one school where the science of logging engineering might be developed under practical instructors. The Pacific Coast was the logical place for the establishment of an American school of logging engineering. More than one-half of the standing timber on the North American continent, estimated at 1,600 billion feet was located in the Province of British Columbia and in the States of Montana, Idaho, Washington, Oregon and California, and the physical conditions surrounding its removal demanded the highest type of a logging engineering school. He suggested that the lumbering interests should endow a school of logging engineering on the Pacific Coast with sufficient funds for successful work. It might take a comparatively large endowment, but the school would yield large dividends to the industry through the increased efficiency in logging systems.

The secretary then dealt briefly with a number of the interesting developments in connection with logging which had occurred during the past year. He stated that some progress was to be reported towards the idea of falling timber with the assistance of a mechanically driven saw, the motive power being supplied by steam or electricity. A number of other interesting matters were discussed, many of which were taken up in detail in the addresses delivered before the Congress.

Physical efficiency, the secretary stated, was coming more and more to be recognized as a most potent factor in the success of any operation. The health of the men was of vital importance to every industry. It was with a feeling of pardonable pride that they could note a marked change in the attitude of loggers generally toward this subject.

The Logging Congress had always been a firm advocate of automatic workmen's compensation. It was pleasing to note that since the last congress the State of Oregon had passed an elective workmen's compensation act and the State of California had also enacted a compulsory act. In British Columbia, a commission had been making an investigation and would report at the next session of the Legislature.

A few of the interesting addresses delivered at the Congress are reported elsewhere in this issue.

Personal News of Interest to Lumbermen

Chirman J. L. Englehardt, of the Temiskaming & Northern Ontario Railway, returned from a visit to the northland recently and reported that extensive pulpwood and logging operations would be largely in evidence next season and that a good market and good prices would prevail.

The Commission of Conservation is strongly urging the appointment of fire marshals to work under government jurisdiction so that the responsibility for forest fires can be placed where it belongs. The commission, in a bulletin recently issued, points out that the fire losses in Canadian forests and elsewhere totalled last year millions of dollars.

J. E. Rothery, Forest Engineer who has been carrying on an extensive survey for the James MacLaren Company, Limited, of Buckingham, P.Q., during the past year, reports that no serious fires have come to his notice during his recent trip into the timber districts.

R. D. Craig, of the Dominion Commission of Conservation, who, for seven years, has been a consulting forestry engineer in British Columbia, has opened offices in Vancouver. The commission intends to take an inventory of the timber resources of the Dominion, beginning with British Columbia, and Dr. H. N. Whitford is now engaged in this work in the interior of the Province. The collection of the required data is expected to take two years. The provincial forest branch is co-operating with the Federal authorities. When the information has been secured maps will be published showing the quantities and species of timber to be found in the Province.

G. Gunnersen, principal of the firm of Gunnersen & Company, timber agents and importers of Melbourne, Australia, visited Vancouver recently. The particular object of his trip was to inquire into the possibilities of establishing a direct trade in British Columbia lumber with Australia. At the present time that country is consuming 170,000,000 feet of lumber each year, the chief exporter being the United States, with Norway and Sweden second. Much of the British Columbia lumber that is sent to the Antipodes is sent through agents in San Francisco, and since trade is being built up between Canada and here sister dominion, Mr. Gunnersen is of the opinion that the business might be done direct.

Mr. H. R. MacMillan, Chief Forester for British Columbia, in a recent report, states that there has been considerable improvement of late in the forest fire situation in the interior of the province. In the Okanagan and Similkameen districts the larger number of fires were then under control, and the department was laying off men. In a letter to the Canada Lumberman under date of August 9th, Mr. MacMillan states that he was then on his way to investigate the fire situation in the Cranbrook district. According to meteorological reports the weather in that district had recently been the worst on record for twenty years. There was no rainfall during June, July and August up to date. Many fires had been reported, but men had been on the job at the beginning of each fire, and there had been no lives lost, no timber destroyed and no towns burned.

Prevention of Accidents in the Woods

Simple and Reasonable Regulations Drawn up by a Western Logging Company to Reduce the Risk to Employees

By A. H. Powers*

The question of accident prevention in the woods is one to which I think every logger has given more or less serious attention. It is, of course, a very difficult proposition to safeguard the men in the woods against preventable accidents with the same degree of assurance that you can men working in the sawmill or planing mill; but I believe it is feasible to devise a simple set of rules which will, in a measure, reduce the accidents incidental to logging operations. With this in mind our company has prepared the following simple code of rules for accident prevention in the woods, and the results attained have justified the time, thought and labor in compiling them. Here are the rules:

Foremen and all Employees

It is the intention and desire of this company that its employees at all times be very careful and keep out of unnecessary danger in every manner and form while employed at their work.

No man is to start at any kind of work unless he is entirely familiar with it, acquainted with the dangers thereof, and fully capable of properly performing the work.

Hook Tenders and Rigging Men

1. You are forbidden to stand or work in the bight of any line.

2. You are forbidden to stand or work close enough to any block so that in case the line breaks the end could possibly whip around and hit you.

3. You are forbidden to stand upon or ride any logs as they are being hauled in by the engine or in front of them.

4. You are forbidden to stand in front of a log or on the downhill side of a log after the engineer has been given the signal to go ahead.

5. You are forbidden to give the signal to go ahead until you are sure that every man is well out of the way, and clear of all limbs.

6. You are instructed to very carefully inspect, look out for, and guard against all falling of dry snags or the tops of trees, when logs come in contact with them as they are being hauled to the landing.

7. You are forbidden to fasten a block (either a Tommy Moore or a trip line block) to anything not perfectly sound and capable of holding any strain that can possibly be brought upon it without danger of its giving way or tipping over.

8. You are forbidden under any circumstances to hitch a Tommy Moore to a standing tree. (A standing tree is liable to tip over at any time without warning.)

9. You are forbidden, in oiling the blocks, to go near the line or blocks when the engine is in motion.

10. Always see that your sniper has all limbs cut off close so that there is no danger of the limbs catching a tree or striking a man.

11. Upon noticing any defect in the block, line, or apparatus, immediately notify the foreman, and cease using the same until it is repaired. We desire all blocks, line and apparatus to be kept at all times in first class condition.

Engineers and Firemen

12. Never turn the engine over except upon proper signal from the right man.

13. Watch your engine carefully, and when you find anything wrong about it or any defect, or failure to work properly, immediately notify the foreman and stop using until it is in proper condition to run.

14. Always see that there is plenty of water in the glass, and keep the gauge cocks open.

15. Test all injectors and pumps frequently, and keep them in first class condition.

16. Never change the safety valve after it is set by the Hartford inspectors. If safety valve fails to work properly, immediately stop using the machine.

17. Be sure that your oil pumps and oil cups are always in first class condition, and that oil is reaching the bearings.

18. Keep the oil holes free from cinders, dirt, and stoppages of every kind.

19. Always keep the engine clean, so that you can notice breaks or cracks, and loose or broken nuts and bolts.

20. Wash the boilers clean every two weeks; always keep the ashes clean in the ash pan, and see that the boilers are well filled with water each night before leaving and that your fire is safe to leave.

Loaders

21. You are forbidden to load any car unless the hand brake is set up tight, and if the car be on any grade, that the snub line with a clevis is fastened to the car.

22. When moving cars ahead, as soon as same are spotted, set up all brakes on both loaded and empty cars.

23. Take no chances whatever in working or walking under or near logs lifted in the air with hooks. Never use the hooks to lift a log scaling more than 1500 feet (very dangerous to do so, as the hooks are liable to pull out and fly). Logs scaling over 1500 feet must be rolled onto the cars with straps fastened from the gin pole, and used as a crotch line.

24. You are forbidden to fasten a hook to any portion of a car, except the car bunk or axle (fastening elsewhere dangerously pulls and strains the car).

25. Have the log loads well formed and balanced, and never exceeding 1500 feet on any one car.

26. Never load logs upon the car at the landing until the track is thoroughly cleaned out, and the rail clear of all mud, chips, sticks and other obstructions and all limbs cut off the logs and stamped on both ends.

27. Always see that the chock blocks on the bunks stand straight up, and that there is no slack in the chain.

28. Use no blocks or rigging that are not perfectly sound and safe in every way.

29. You are forbidden to use, or allow to be used, any No. 1 logs for wood, either for the donkeys or cook house.

Fallers

30. Never stand close to trees when falling.

31. Always give plenty of warning to all employees and persons near before a tree is felled.

32. Cut all fir and white cedar (unless very churn butted) less than four feet from the ground, and as much lower as practical to fall it.

Note: All stumps left higher than four feet will be scaled up and charged back to the fallers.

33. Always fall every snag that is in any wise liable to blow over, or fall on you while at work.

34. Always keep a lookout for loose limbs and sailors, and avoid the same.

35. Immediately turn in all tools not in proper shape or repair, notify the foreman, and procure others.

36. Never fall timber up steep slopes; fall it down hill, or sideways; on level ground, or slopes where trees will lie where felled, fall the timber upgrade, and into the standing timber as far as practical, and in a direction straight away from points where landing will be located. Fall the largest trees first, and small trees and cedar on top to avoid breakages.

Buckers

37. Be careful to cut all logs where measured.

38. Block up logs, so that the same will not split while bucking.

39. Always work on the upper side of a log on the side hill, so as to avoid the danger of its rolling on you.

40. Do not work near or under trees having loose limbs or sailors; but first have same cut down.

41. At all times be extremely careful to keep away from lines, and from falling timber. Coast timber is very long and the limbs frequently fly a long distance when felled.

Train Men and Construction Men

42. Haul no logs until you are certain that the load is well balanced, secure and safe.

43. Never stand beside or near a train or load of logs that is in motion.

44. Do not get on or off the cars or engines while in motion; and do not walk over log cars while in motion.

45. Never stand between cars while coupling (logs often extend over the ends of the cars).

46. Be extremely careful to keep out of danger in unloading steel, stringers, and bridge timber; in working around or near pile drivers or trestle work of any kind.

* By A. H. Powers, of the Smith-Powers Logging Co., Portland, Ore. An address before the 6th session of the Pacific Logging Congress, August 27th to 29th.

47. Never get under a pile while it is being raised.

48. Never work or go under trestles when stringers or bridge timbers are being laid upon the same.

49. Immediately report in writing any track or trestle out of repair or in anywise unsafe.

50. Immediately report any defects in engines, apparatus, cars or track.

51. On branch lines always throw the derail behind cars left at landing.

52. On main lines always work under orders; and run only after securing right of way from train dispatcher.

53. Keep train under absolute control; run slow and be very careful in switching and other work in foggy weather. See that your lights and lanterns are in good condition.

54. If you know, or suspect, any physical defect or inexperience in yourself or fellow-workmen, immediately report the same to your superior, or to the company.

Cooks

55. Feed tht men good, wholesome food, in abundance, and be attentive and obliging to their wants.

56. Do not throw away any good provisions, and immediately notify foreman of any laborer or employees detected in doing so.

57. Make all complaints to the foreman as to lack of provisions or equipment, or unsatisfactory help. Keep your camps clean and always in good sanitary condition.

Foremen

58. Always thoroughly instruct each man as to his work and the dangers thereof, and secure his consent before placing him upon any job involving danger.

59. Immediately discharge any habitual drunkard, or man who comes to the camp in a drunken condition.

60. Immediately discharge any man who brings liquor to camp.

61. Treat the men courteously and fairly, and see that the clerks and cooks are courteous and fair and that the men are fed in the best possible manner. (The company intends at all times to furnish the best, wholesome provisions that the market affords).

In General

Any man having a grievance should take the same up with the foreman at his camp, and if the same is not satisfactorily adjusted, should then report the whole matter in writing to some general officer of the company.

A Few Hints on First Aid

I.

Sterile bandages, antiseptics, text books upon First Aid to Injured, medicines for colds, bowel complaints, etc., are kept by each time-keeper.

II.

Don't give whiskey in cases of shock, fainting, or severe accident. Give black coffee. If necessary send bottle of black coffee along with patient to hospital.

Cover patient with plenty of blankets and apply heat to body, viz., hot bricks or stove cover wrapped in cloths, or bottles filled with hot water.

III.

All minor wounds such as jaggers, scratches and skin abrasions, first cleanse with soap and water; second, dry; third, apply tincture of iodine to wound and area around it. Fourth, apply sterile bandages.

IV.

Larger wounds, cleanse with soap and water, apply tincture of iodine and sterile bandages. Then report to company surgeon to have wound treated.

V.

Contusions, bruises and sprains, slight ones are best treated by rest, hot applications and liniments, but have all severe cases examined by company surgeon to eliminate possibility of a fracture.

VI.

Scalds and Burns

Apply olive oil, cylinder oil or vaseline; then apply bandages.

Fractures

Preparations for transporting fractured arms, forearms, hands, fingers, apply padded splints made of boards, bark or paste board, several layers, to anterior and posterior surface, using bandages, rope, twine, etc., to hold in place.

Thigh

Leg and thigh, strap board or hewn pole to body and limb long enough to reach from arm pit to heel.

Leg

Use pillow or blanket rolled from both ends or padded boards strapped on.

Pelvis, Spine and Skull

Make patient comfortable and transport quickly and gently as possible.

VIII.

Hemorrhage from extremity (arm and leg) slight oozing from wounds usually controlled by sterile bandages or dressings wrung out of hot water and placed in wound.

Uncontrollable Hemorrhages

Place tourniquet made of small rubber hose, handkerchiefs, suspenders, bandages or rope, between wound and body. In case this does not check all of bleeding apply another tourniquet between wound and end of extremity.

Fire Prevention Through Creation of Public Sentiment

By E. T. Allen†

I have been asked to make a report on the progress of co-operative fire prevention since you met last year. It must be largely a record of perfecting details, rather than of radical discoveries, because the Pacific Northwest is so far advanced in fire work that general principles seem to be pretty well established. Last year was about a normal one as to weather and hazard, such as once would have brought much loss, but out of nearly 25 million acres guarded by our allied patrols only 2,800 acres of merchantable timber, or an 80th of one per cent., were burned over. The actual loss was but 583,000 feet, or about a thousandth of one per cent. of the timber protected.

This proves that the system will meet the normal year. What we are after is to do this still more cheaply and surely and, more important still, to be able to meet the abnormally bad year which is sure to come sometime. I shall touch upon this shortly. In the meantime let me remind you that the Western Forestry & Conservation Association (for which Mr. Allen occupies the position of Forester) has come to be so generally recognized as representing western forest management along all progressive lines, as well as in fire prevention, that some of its other work may be of equal interest to the Logging Congress.

As our local constituents have become stronger and local affairs have reached a better footing, it has seemed to our central organization that it should devote more and more time to giving western forest interests a national voice in all matters affecting the industry either directly or through example. Consequently we have participated increasingly in all eastern movements affecting forests and lumber, taxation, etc., until our place in all deliberations of this kind is conceded. By being scrupulous to be fair and equally considerate of private and public interests, working only for the most just and permanent basis of forest industry, our influence has become very great.

Returning to fire prevention, we have as usual kept this subject before the public by a number of educational devices.

The "Putting Out the Campfire" picture, an impressive colored picture showing a woodsman extinguishing his fire before leaving camp, has been placed on practically every schoolroom wall in the forested Northwest and in a smaller size been taken home to every family in important territory. It has also gone to every newspaper office. This picture made a big hit. In many cases teachers used it as a composition subject.

A cartoon poster using a clock face to show the danger season and provide a calendar, has been distributed to the number of 20,000.

We have sent out 10,000 sequence signs, six in a set and each bringing out a different appeal against carelessness with fire, designed to be posted along trails and roads so travellers after reading one or two will watch for the next. These are very popular.

Ranking with our public school devices as among the most far-reaching things we have put out, and comparatively inexpensive, are the slides we have put before the public in every Northwestern town that has a moving picture theatre. In the larger towns we have used several of the best houses, also the cheaper places patronized by laboring men. The first set consisted of three slides. Two more went out when the fire season was more advanced.

Tin cups bearing fire material in the bottom were supplied constituent associations for distribution by wardens to road gangs, camping parties, etc., and for placing at springs.

By arranging for joint orders, cheap rates were obtained on about 20,000 whetstones with fire cautions on the back.

Two associations were furnished rulers with appropriate printing.

All railroads were reminded to repeat fire material in the Summer folders and resort "literature."

A magazine supplement syndicate supplying over 50 Northwestern papers with a weekly extra runs special fire and lumbering ma-

† Address delivered before Sixth Session of the Pacific Logging Congress, August 27th to 29th.

terial whenever we wish. Also the railroad magazine, "Pacific Semaphore."

About 800 newspapers receive monthly bulletins on fire news and precautions.

State school authorities were provided with forest protective material for Arbor Day use.

Negotiations are under way with cartridge manufacturers to enclose fire precaution slips in cartridge packages and for featuring the subject in 1915 calendars.

The United States Forest Service has two complete framed exhibits of all our publicity devices which it displays at suitable eastern gatherings and expositions, calling attention to our work.

The cost of the above projects has been partly reimbursed by sales of material in Canada and to state forest departments. British Columbia obtains practically all its forest publicity material from us and we sell a considerable quantity in the east.

I have not thought it necessary to mention the matters of clearing-house facilities between local organizations with which each is necessarily familiar, or our extensive correspondence with agencies of all kinds all over the country, including forest and tax officials, bonding and investment houses, protective organizations, etc., in which the affairs of northwestern forest industry may be promoted.

Our constituent patrol associations have added few absolutely new features to their field methods this year, for they were already up to date, but every season sees the system strengthened. Telephone and trail building has progressed, adding to the efficiency and economy of patrol. Lookout stations and their equipment with telephones and fire locating instruments are proving of great value. Slash burning before the danger season began was given unusual attention. Co-operation with state and federal systems was perfected beyond that of previous years. There is increasing co-operation by logging operators. It is along this line that the greatest advance is probable in the near future. I confidently expect to see every logging operation conducted under a rigid fire plan, every detail of which is considered quite as important as keeping up the log output.

Finally, let me remind you that we approach a legislative season in which the watchword will be economy and lower taxes. We must all be vigilant to protect our already inadequate legislative support of this work, which is essentially insurance of the northwest's most important industry and source of community revenue. No economy can be effected here without risking thousands of dollars for every dollar saved.

Yarding and Logging By Machinery

A Brief Consideration of the Problems and Costs in Connection with an Important Logging Method

By J. P. Van Orsdel†

For the sake of brevity, let us assume that the timber tract under consideration has been properly opened up to the best advantage, with main line, spurs and branch line railroads, and that we are right up to the proposition of yarding and loading.

In a great many ways, every other condition being normal, the expense of your entire operation depends to a very great extent on the judgment used in laying out and carrying on the yarding of your logs—in that so many of the other phases of your work are resultant or dependent operations with resultant or dependent costs.

Falling, bucking and railroad construction costs are independent of any effect or results from the yarding and loading, but all other phases of your work are dependent on the efficiency with which the yarding and loading is carried on. Ground yarding and skidding is the method used in 95 per cent. of the Western camps, and this is the method I am going to discuss and leave others to give their information on overhead systems. I do not mean by this that the overhead system or systems have not the merit of other modes of logging, for under certain topographical conditions they are the only practical means of getting the timber to the market. I am most certainly of the opinion that the use of both methods in some camps would be the proper and economic course. Whichever logging machinery manufacturer puts on the market a practical machine for say, $5,000, that can be used to equal advantage for an overhead or ground system of yarding, will meet the needs of a great many operators. The reason the loggers have not gone more into the overhead system is because the initial expense at the present is so great, and if the sky line machine does not work out satisfactorily on their property they have an expensive piece of equipment on their hands which at least for a time would have no value.

In timber on comparatively flat ground where the maximum yarding distance is not in excess of 950 feet and the difference in elevation does not exceed 75 feet, the largest log does not exceed 1,000 feet board measure, and the species are red fir or pine, then a 10 x 11-inch compound-geared high-speed yarder of any standard make would be the best machine to try.

In timber on rolling ground where the greatest yarding is not in excess of 1,000 feet, the difference in elevation over the average yarding area does not exceed 150 feet, and the maximum log does not exceed 5,000 feet; then a 11 x 13 compound-geared high-speed yarder of any standard make would be the best machine to use.

For conditions which would be more severe than above stated—I would recommend the purchase of a machine equipped with 12 x 14 engines compound-geared of any standard make. All machines should be equipped with high pressure boilers of large capacity. All yarding machines should be equipped with three drums. For loading purposes a machine should have three drums and 8½ x 10 engine to give the best results, although a lighter can be used in small or light timber.

From past experience I would recommend the following size of main yarding lines and trip lines:

For 10 x 11 yarders a 1¼ main line and 9-16 trip line. For 11 x 13 yarders a 1⅜ main line and ⅝ trip line. For 12 x 14 yarders a 1½ main line and 11-16 or ¾ trip line.

While some of these sizes may seem large, I have found by keeping records on lines that the additional cost of the slightly larger cables is more than paid for by the increased amount of output by each line. The third drum on the yarder should be equipped with 1,500 feet of ⅜-inch line to be used to put the trip line out with.

All the above machine and line sizes are based and figured when the uphill yarding system is used, which is generally admitted as being the most practical way of carrying on a ground yarding operation.

During the early part of the year 1912 we had the best opportunity to prove to our entire satisfaction the practicability of the uphill yarding system and its advantages over logging down hill.

The test was made with the same machine (a 11 x 13 Mogul yarder) hook tender and nearly the same crew throughout. The topography of the country and the stand of the timber was identical. As the areas were adjacent we logged the one area first down hill and immediately followed by the uphill work. If either scheme had the advantage, the downhill scheme was favored; because the hook tender and the engineer were inclined to think that the machine was not large enough to do the uphill work. On the area that was logged down hill we were 31 working days yarding the show and the total production was 1,725,153 feet, or an average output of 55,650 feet per day. On the continguous uphill area we were 24 working days yarding the show and the total production was 2,364,126 feet, or an average output daily of 98,505 feet. The average stand per acre was approximately 90,000 feet.

We found that our machinery was a little light and we have since replaced the yarders with 12 x 14 compound geared yarders which are just right for our service.

When the butt chain lead block was placed on the market it solved a great many problems and, while this piece of equipment is still a necessary adjunct to all well-regulated and equipped camps, it has in the same kind of camps been replaced to a great extent by the yarding or stump rollers. This device allows for the same speed with less friction and also does away with the service of one man. By placing three rollers on the arc of a circle, it is possible and practical to log directly back of a landing or rollway without the use of a lead block.

I find that where 75 logs are handled per day of 10 hours that the lost time will amount to one minute for each log, or 75 minutes a day. Where the production of logs ranges from 125 to 150 per day the time putting each log through would be less—still the total time lost per day would be 75 minutes. Using 75 minutes and 75 logs as a basis, the average length of time consumed in yarding each log would be eight minutes, or at least the output can be increased between 9 and 10 logs per day by the use of rollers instead of lead blocks without taking into consideration the one man less in your ordinary yarding crew—on this basis it will not take very long to pay for a full stock of stump rollers.

What to my mind is of utmost importance in carrying on a successful operation is that our yarding and loading operations be carried

† Address delivered before Sixth Session of the Pacific Logging Congress, August 27th to 29th

on at full capacity each working day in the month and for the full 10 hours each. To do this successfully each camp must be equipped with an extra yarding and loading machine which can be moved and set ahead at the next landing prior to the time that the crew which is to do the yarding has moved from their last rollway. In a camp where four or five sides are operating simultaneously, it would be necessary to have a small crew for this purpose; but in a two-yarder camp the same crew that does the clearing of right of way and builds the landings could make the moves. After the machinery is placed—the hook tender who is to yard the area can take the above mentioned crew and place the lines out so that when they are actually ready to occupy the show, the lines are out, the steam is up and the only time lost to the yarding crew is in moving the small rigging. In our camps we have made these changes a number of times in 30 minutes from the time the last log is pulled onto the rollway until the first log is landed on the new rollway.

It is not always the best log getting hook tender that is the best donkey mover, and it has been my experience that men who are engaged in yarding and loading are not much good when it comes to doing work which they consider is out of their line, while men engaged for the purpose do not expect anything else and are not such high-priced labor.

The topographical conditions and stand per acre have a material bearing on what should be the maximum yarding distance. The topographical features must and will make changes in any arbitrary rules you might make with regard to this phase of the game; with regard to the stand per acre I have arrived at the following figures as a general basis for calculations in laying out a logging show:

20 to 40 M. feet timber per acre, 1,200 feet maximum yarding, distance.

40 to 60 M. feet timber per acre, 1,100 feet maximum yarding distance.

60 to 80 M. feet timber per acre, 1,000 feet maximum yarding distance.

80 to 100 M. feet timber per acre, 900 feet maximum yarding distance.

100 to 120 M. feet timber per acre, 800 feet miximum yarding distance.

120 to 140 M. feet timber per acre, 700 feet maximum yarding distance.

140 to 160 M. feet timber per acre, 600 feet maximum yarding distance.

160 to 200 M. feet timber per acre, 500 feet maximum yarding distance.

The use of road donkeys for reaching timber which cannot be brought within direct yarding distance of the railroad is a subject in itself, and I will not try to go into a discussion of that matter at this time.

As you all know, the cost of yarding is controlled by a great many factors, but with proper machines which are suited for the country to be logged, the use of the uphill yarding system, stand per acre has more effect on the cost than any other factor. I have compiled the following figures from my personal experience as being standard costs of yarding and should only show slight changes for other conditions which you might encounter. These figures are based on an average log unit of 1200 feet board measure.

20 to 40 M. feet timber average per acre, yarding cost 64c per M.
40 to 60 M. feet timber average per acre, yarding cost 60c per M.
60 to 80 M. feet timber average per acre, yarding cost 57c per M.
80 to 100 M. ft. timber average per acre, yarding cost 54c per M.
100 to 120 M. ft. timber average per acre, yarding cost 51c per M.
120 to 140 M. feet timber average per acre, yarding cost 48c per M.
140 to 160 M. ft. timber average per acre, yarding cost 45c per M.
160 to 200 M. ft. timber average per acre, yarding cost 42c per M.

I have checked these figures up very carefully and find that actual and practical experience will bear them out.

The proper type of rollway or landing is of vital importance to the carrying on of a fast yarding and loading operation.

The size of lines for loading would of course be controlled by the size of the timber to be loaded.

The cost of loading is a dependent or resultant cost and depends entirely—or to a great extent—on the daily production or output. The cost will vary from 12 cents to 18 cents per thousand.

Collecting as a Diversion

"There is one town in my territory," said the lumber salesman, "where I always plan to stay at least a day for a visit with my friend the Old Timer. He has been many years in the lumber business, has worked with his eyes open, has been a good observer, and has an unfailing lot of stories and reminiscences. He has succeeded to the extent that he can now look upon his business rather as a diversion than an occupation and can take time to visit with his friends, one of whom I am privileged to be. I usually find him in the back office, frequently reading his lumber journal," says G. L. D., in The American Lumberman. "The last time I called he was cleaning out his desk and he held up to my view a bundle of old letters. 'Say,' he said, 'you ought to have been here this morning. I took the old road burner out for a collecting trip. Collecting is funny business. The case this morning was easy. But I've had some that made me think twice before I got the kopecks. I nearly always got 'em, though, even if it did take scheming some times. These letters are nearly all on the collecting subject, and they just now recall the first case I had of a difficult account.

"'In the time that I have shuffled boards I have been line-yard manager, auditor, individual owner and have combined hardware and all the side lines in a laudable endeavor to supply people what they want in building material, at the same time trying to save a little velvet for the company. The collection I am thinking of now was soon after I took the management of my first.

"'In those days it seemed to be the policy of the line yard owners to shift men as soon as they became acquainted in the town. Don't know why, but I got three moves—promotions they called them—in such quick succession that at one time I had three best girls—yes, got one of 'em yet. The man I succeeded at one place had sold a barn bill to a hoss trader named Call. He was about as dependable as the hosses he picked up on his rounds through the country. It was Call's custom to rig up a camping outfit, load it into a covered wagon, trail all the derelict hosses he could find to the wagon, then the others to their tails, and, followed by this whip-cracker aggregation of ringbone and spavin samples, follow where the road led, as long as he could scent out a trade, depending on the "boot" taken in the swaps to buy provender for himself and hosses. He failed to pay, of course, and the agent failed to secure. He was fireproof against any collection laws and the bill had been on the ledger for a year or more.

"'Just before I went there Call had been away on one of his trading trips and had been gone nearly two months. The retiring agent had mailed him forty post card duns, sending one each day for the forty days. When Call got back and found them he was furious. He marched—he paraded to the office to wipe up the floor with the offender. He found me, an 18-year-old boy, and too insignificant for him to vent his wrath on. He was so sassy about the company, the lumber business in general and the former agent that I wanted to kick his slats in; but my judgment controlled my valor while I told him I would receipt him for any amount he wanted to pay on account. He informed me he didn't want to pay anything on the account and never intended to. Also, that he would see the whole outfit in hades rather than pay any of the bill. I told him that while he felt that way about it now I thought he would change his mind and pay me.

"'This state of affairs continued for several months. When he would meet me he would frequently take the opportunity to redeclare his intentions and I always answered that I still thought he would pay me some time.

"'One day I met him and asked him for ten dollars as I needed it to make up the amount of freight I had to pay. To my surprise he gave it to me, peeling the ten off of a roll of bills. He again assured me that this was the last I would get.

"'Besides the amount due on the lumber he owed some $200 on his house, and I learned that he paid that amount the next day after paying me the ten, and learned also that he was about strapped.

"'About the last of the following October he was making preparations to go on another swapping tour. He was to start the first day of November when he found he had no harness. Bridles, collars, everything was gone. He tried to borrow; then to buy on tick—nothing doing. In this dilemma he came to me and actually had the nerve to ask me to guarantee the payment at the harness shop. I regretted I could not do this, but offered to give him his account, now $60, and $20 cash for a hoss he had—a really good one.

"'He protested vigorously, declaring it was as bad as stealing the hoss from him, but his need was great and he must have the harness, so we traded.

"'Now,' said the Old Timer, 'if you've been listening to what I've been telling you, you're wondering what sort of a set of harness he could get for $20. Well, he got a good outfit. For, mind you, harness has advanced more than lumber since then. As most of the high cost of living we hear so much about is charged to the lumbermen, it is probable that the advance in lumber prices has boosted the prices of tan bark which in turn has—but this is not telling the story.

"'Soon's I got the hoss I took him to a liveryman and told him to sell him as soon as he could get me net $100 above his charges and the feed bill. He sold him in a few days and when he paid me the hundred said he was satisfied with what he got. I was, with what the company got, as they were $20 ahead for interest.'"

Merchandizing of Lumber

By J. J. Rockwell*

The lumber industry is a big industry. It does things in a big way. It deals in a big product. It deals in that product in great quantities. It always talks in thousands and millions. A 16-foot 2 x 4, when a man wants it to hold up a flower box on his porch or in front of his window, is quite a item to that man, but the lumberman is so used to seeing and thinking and talking of 2 x 4's in millions of feet that to him one poor, lone, single 2 x 4 is no more than a toothpick.

The remarkable part of this point of view is that all these millions and billions of feet of lumber, requiring the activities and the energies of something over a million men to make the market in which hundreds and hundreds of millions of dollars of capital are invested, this tremendous product which gives foundation to our railroads, spans our rivers with bridges, houses the greater proportion of our population, all of it in existence, and all that ever has existed, and all that ever will exist, has been or will be produced by little seeds, of which the tiny acorn, as big as the end of a man's thumb, is a fairly large specimen.

It is perfectly natural for the mind of the lumberman, whether he be a holder of lumber, a maker of lumber, or a seller of lumber in a comparatively small retail way, to look at his product in this fashion. It is a big product—even a little dinky, retail yard in a small country town requires considerable ground therein for its stock. Every time a little bit of stock is moved, a wagon or freight car must be called into service, and where it is moved in even moderately large quantities with rapidity and facility, we have to use power of some kind for moving it.

Consequently it is natural, further, that the lumberman should look on the marketing of his product from this same big standpoint. If I go around to talk to a retail lumberman about getting a little stock of boards for a window flower box, he has not the slightest interest in me and rather feels that I am a disturbing element and shouldn't come around bothering him.

The lumber manufacturer, who happens to be approached by a consumer with an inquiry as to where this consumer can get a small supply of some of the kind of product which the manufacturer makes, feels very much bored about it, and the mere buyer is apt to receive a rather cold reception.

To a philosopher it would seem logical to assume that man whose entire stock in trade had grown from a few tiny seeds would be inclined to think that a large volume of business might grow from a few tiny seeds of demand.

Selling Little Things

I present Exhibit A—just a common, ordinary match such as we light our cigars with from three to twenty times a day and throw away.

I have not the slightest doubt that the first lumber manufacturer who was approached on the idea of furnishing a little stock of lumber for the manufacture of matches was probably inclined to believe that the match man was a dreamer, if not totally crazy.

I have not been able to get any definite statistics as to the amount of lumber used in the manufacture of matches to-day, but we all know that it runs into very respectable quantities.

To recur to my illustration of my being in the market for lumber for a window flower box, let us suppose that instead of being cold, haughty and repellant, the lumber retailer whom I approached on the subject had been cordial and interested, and had asked me whether there were not a number of other houses in my neighborhood which ought to have window boxes, and had made a suggestion to me that this idea of growing flowers around the house was a fine thing. That I ought to advocate it with my neighbors, so that the whole neighborhood might be beautified. Suppose the dealer had gotten me so interested along this line that I would have become fired with enthusiasm, as a missionary, to go out among my neighbors and point with pride to my flower boxes and tell them to go and do likewise. Mr. Retailer might even have taken a little trouble to advise me to be careful to see that my boxes when made were properly bored to give sufficient drainage, and have told me that if I succeeded in getting my neighbors to accept my viewpoint to be sure and tell them that he had the kind of lumber that they needed and that he was a very accommodating merchant who would take care of their wants. It does not seem such a very far-fetched conclusion that a retail dealer proceeding along these lines, and even going so far as to send out a few circulars or do a little advertising in his local newspaper on this subject, in the right manner, might very easily dispose of a carload or two of lumber every season, and it would be common lumber, which would be nice for the manufacturer.

The wood paving block, considered as a single unit, is a very small item—it's just a little thing not much larger than a brick—and yet I understand that in one species of lumber alone in this country over a billion feet of material is sold for this use, but how many lumbermen think of the further extension of the paving block idea? Does it ever occur to a retailer to study up on the subject of these blocks for the paving of factories, machine shops and foundries where the value of this product has been definitely and conclusively proven, and argue them into the idea of using paving blocks for that purpose? Does he ever consider advertising to the farmers of his district the extreme value of creosoted wood paving blocks for use in flooring their barns and dairies? Is there any doubt that if the owners of such properties were once acquainted with the eventful economy and durability of wood blocks for such use, with their sanitary character, with the advantageous effect of wood block paving for their animals, that they would not only be willing but glad to utilize this product?

Is it not worth making an effort to get such a market started? A few properties paved in any district will act as the little seeds from which the big demand will grow.

This as I see it is the crux of the question in the marketing of lumber. The great crying need is for the lumber industry—and by the lumber industry I mean not some of its parts but all of its parts—the timber owner, the manufacturer, the wholesaler and the retailer, to plant these seeds in the minds of possible new consumers in order that the use of the product and its market possibilities may grow.

Conditions Have Changed

In the days not very long gone by lumber was an absolute necessity. You could not build a house, a barn, a factory, a church, a school, a pig-pen, or a corn-crib, without the use of lumber, and you had nothing but lumber to use. That condition is changed; there are other materials which are bidding for the business, successfully bidding for it, and in some cases and in some uses they have become the standard, and properly so. They have proven their right to certain functions of use developed by new conditions, and we are glad that they are here. In the days gone by we did not feel the needs that we feel to-day; we did not have the great centres of civic and industrial life. Our communities were constantly spreading. There was plenty of land—available land. As a merchant's business grew rapidly, he put on an ell to his building and extended it out into the next lot. You can't do that to-day in the large cities, or any fair-sized town—the building has to go up into the air, and it has been forced to go higher and higher, and the sky-scraper, a product of modern invention within the last thirty years, is the result. You could not properly use lumber for that. The result of congestion in our industrial life has been to produce this new type of structure, which takes the place of the spread-out type which existed when land was available at all points.

Where we used to build forty buildings, one-storey high, and build them of wood, we now build one building forty storeys high, and build it of steel and tile and concrete, and necessarily so. The effect is, of course, that the lumber industry has lost a demand for material to be used in the construction of forty buildings.

But building is not the only thing that lumber can be used for. I again refer to Exhibit A.

New Uses for Lumber

All around us we see large businesses being established for the manufacture of new products of which the raw material is wood. But these things are being invented and their sale promoted by other interests, and not by the lumber industry. Surely if this great industry go behind a department of research and investigation and invention and determined new places for the use of the product it would have a tremendous effect on the industry, but you would have to tell people about them. Merely inventing a thing does not sell it; merely making it does not sell it. You must have demand to make a profit.

I am not a lumberman but I have in mind to-day three things for which the use of lumber has never been promoted, and I am convinced that the slightest investigation would show tremendous possibilities for the sale of lumber in all these directions if the material were promoted for these purposes.

Being an advertising man you would naturally assume that I would speak entirely from the advertising standpoint, or rather what some men consider as advertising—that is, merely the use of the printed word and picture. On the contrary, I say that advertising can produce maximum efficiency only when it is supported and aided and co-operated with by every selling force in the industry.

Advertising does nothing but sow the seed. If given time of course it will eventually produce the crop, but it will produce that in infinitely less time, with infinitely greater results if the ground is carefully cultivated and tended, if intelligent, intensive cultivation is given by all the sales forces of the industry. To sum up, then, I would say, from the standpoint of the advertising man, considering the lumber industry, do not despise small things, they will grow.

The little break in the dike of inertia and ignorance, especially if

*Address delivered recently before the National Lumber Manufacturers' Association.

it is helped and broadened by intelligent effort, will produce a flow of demand and of profitable selling and merchandising.

The greater difficulty that is met with, in attempting to formulate definite methods for this result, is to secure intelligent, enthusiastic, active co-operation from all sources. The lumber industry is so big, so widely ramified in so many different channels and directions that it cannot be educated to these things in a day, but when once so educated the market results will be most beneficial.

Merchandizing of Lumber from the Standpoint of the Salesman

By B. M. Nelson

The subject on which I have been asked to address you is one which, no doubt, all of you, like myself, know something about in a general way, but when it comes to passing upon the true merits of the substitutes, or how to combat the infringement upon the interest of the lumbermen, possibly few, if any of us, have given it enough consideration even to solve the problem in our own minds, to say nothing of the action necessary to make our ideas effective.

There is so much to be said on the subject that I can only dwell upon the surface, so to speak, as time will not permit of my going into details.

We have made improvements in the methods of logging and manufacturing, but little or no advancement or improvement in merchandising or in promoting the use of our product. Practically the only change is, the manufacturers are selling more lumber direct to the retailer, and have added some expense by increasing the number of salesmen. We have given scarcely any thought to the real merits of our product. We have little or no data, intelligently compiled, to pass out to the public substantiating our claims as to the merits of wood products. The cypress manufacturers, during the last year or two, have done more than any other wood manufacturers in this direction. How many lumbermen can go before the public to-day and defend the merits of their product? We have given but little consideration to what the buyer does with the lumber after the sales are made and the contracts completed; we have given but little attention at the time of making the sales to whether the buyer was buying a quality of lumber best adapted for the purpose intended. The thought, apparently, has been to make the most profit we could out of the order. And in many cases, if the manufacturer has found that the buyer would accept a quality of lumber inferior to what his order called for the lowest acceptable grade or quality has been shipped, regardless of whether or not it would answer the purpose. As a result, a quality of lumber has often been used for purposes for which it was unfit, and because of this abuse the use of lumber has been condemned.

Many of our troubles are due to the methods of some wholesale lumbermen who have no interest in timber, and the success of whose business is measured wholly by the profit as between the purchase price to the manufacturer and the selling price to the retailer or consumer. Competition, and the lack of knowledge of the users of lumber have caused such wholesalers as this to sell one grade to the buyer and buy a lower grade from the manufacturer, and take their chances on having the purchased grade accepted. Many methods are resorted to in accomplishing this end, some of which have been dishonest. As a result, the use of lumber, for many purposes, is suffering, and it has given the substitutes greater opportunity for their introduction.

I believe the manufacturers should give more attention, first, to seeing that the architectural engineers and users of lumber throughout the country are better educated as to the true merits of each wood species in such a manner as will cause them to use the quality or grade of lumber best adapted for the purpose intended; second, when the orders are placed, see that the manufacturer or wholesaler furnishes the grade and quality of lumber called for on the order. Heretofore, our associations have devoted their energies more to protecting the manufacturer against unjust claims, leaving it to the buyer and consumer to protect themselves. I think it is just as much to our interest for the associations to see that the buyer and consumer of lumber get what they buy.

Encroachment of Substitutes

Years ago, when stumpage was not worth anything, and lumber so cheap, the substitutes had little or no chance to enter into competition, but now that the forests are being depleted and the price of stumpage has advanced, there is greater opportunity for their encroachment, and the manufacturers of substitutes are taking advantage of it. Having had to create a market for their product they have educated themselves along lines in which we lumbermen are deficient. Lumber having been used so long we have taken it for granted that the people know all about its uses, quality and classification, and, hence, have not considered it necessary to spend any energy trying to educate them. But the inroad made by the substitutes in the last few years is causing us to realize the seriousness of the situation. I do not wish to take up your time enumerating all the changes that have come about, because no doubt, you are familiar with the many uses lumber has enjoyed that have been displaced by substitutes. About the only articles which seem to enjoy immunity are sounding boards in pianos, axe handles and ox yokes.

The array of arguments being put forth by the substitutes would cause a Shakespeare or Webster to turn green with envy. In some cases there is merit, but many of their contentions are not substantiated by facts. And while false contentions being made by them at present may react against them later on, it is hurting the lumber business now, and many of us will not be interested in what happens later, because our stumpage will have been used up.

How to overcome all of these difficulties and prevent the substitutes from imposing further upon us is a problem too difficult for me to solve; but I believe, if the different associations, would appoint a number of committees and rally to their support, call upon our neighbors who never attend any meetings, get them interested and working with us in some direction and attending meetings, hearing the reports of what other committees are doing, we would soon educate ourselves and work up enough enthusiasm to overcome our troubles.

Nature has favored the lumbermen in many ways. The depleting of the timber supply gives a natural advantage that practically no other industry in the world has. But this advantage has caused us to overlook the importance of promoting our own product, which has given the substitutes the advantage, they having had to create a market for their product.

A Matter of Co-Operation

I figure the greatest good can be accomplished through the co-operation of all wood manufacturers, because, in the end, our interest is largely the same. It is difficult to increase the consumption of one wood without interfering with or decreasing the consumption of another; and the increase in the consumption of one wood at the expense of another will eventually react against wood products as a whole. For instance, the yellow pine manufacturers could reduce their prices and increase the consumption of their produce so long as the other woods would keep up their prices. But to do this would cause the manufacturers of competing woods to pile up stock, and unless the natural conditions of the country would bring about an increased demand for lumber, the competing woods would eventually lower their prices to meet the situation, and the yellow pine manufacturers would soon find their territory no greater, but the price reduced.

There are, however, many conditions and problems concerning the consumption of each wood species that require special treatment, and I should like to urge that each lumber association or manufacturer interested in any wood species appoint committees and devise means to protect our industry from infringement by the substitutes, and promote an increased demand in every direction, not at the expense or sacrifice of some other wood now being used, but in some new direction.

I should like to urge the appointment of a national bureau for the purpose of making scientific research in any direction which may be for the general benefit of all wood producers, and let the committees of the different associations, working on problems which affect all wood species, co-operate with the national bureau so as to avoid friction as between the different wood species, and try to work together with as little conflict as possible.

This bureau should work through and in connection with the laboratory at Madison, and all other scientific research laboratories and schools throughout the entire world. The government has established a laboratory at Madison and has invited us to aid and co-operate with them, but so far as I can learn we are not giving it an opportunity to be of any benefit to us.

The retailer, not being interested in stumpage, is naturally not so much interested in the future use of lumber as the manufacturer. It makes little differenec to him whether he sells lumber or substitutes. Of course, if the substitutes are something he can not well handle, he will devote more energy toward promoting the use of lumber.

The silo business has proved to us how our lumber merchants compare with those in other lines of industry in promoting their product in some new direction. Most of the silos are being constructed of wood, yet, I dare say, 95 per cent. of the wood silos constructed to date have been sold by silo manufacturers direct to the consumer through some other than a lumber dealer, although the dealers in most cases have been given first chance and urged to go after the business.

So we can not rely too much upon the retailer to promote the consumption of our product. However, we can not afford to overlook the fact that our interests can best be promoted through the retail lumber merchant; our success in promoting and protecting our interest lies in educating him, getting him out of the rut and seeing if he can not be made as efficient in merchandising as those in other indus-

tries. He is on the ground and should be best qualified to cope with whatever contingencies may arise.

There are many difficulties that can be overcome if the manufacturers will co-operate more with the retailer, and through him amend their grading rules and classifications in a manner to meet the public demands. The manufacturers have been too independent in formulating their grades and classifications; in many cases they have been too one-sided, too little consideration has been given the requirements of the buyer or consumer, who, in the end, must be satisfied if the lumber is to be consumed. The retailer comes into direct contact with the consumer, the manufacturer does not. The retailer should, therefore, be solicited and his ideas given consideration when formulating our grading rules and classifications. I do not mean by this that he should dictate, but the demands of the buying public should be duly considered. This is more necessary under present conditions than it has been in the past.

Many of the retailers are going to oppose, for various reasons, some of the plans we may suggest, and it will doubtless be necessary to make experiments in different directions to find out just what course is best to pursue. All of this work should be looked after by committees appointed by the individual lumber associations and manufacturers of different wood species. The lumber salesmen throughout the country should be schooled along different lines. Instead of plodding along taking orders offered them here and there, they should be instructed to educate the retailer in a way to produce better results; they should report to the different bureaus which may be established any new construction of any nature in which wood could be used; and there should be a system of following up matters of this kind in the same manner as the substitutes.

Depend Too Much Upon Secretaries

I think the lumber associations depend too much upon their secretaries, and one or two other officers, to do all the work; and the few who are appointed on the different committees accept the appointments merely as a matter of courtesy and really make no effort to perform the obligations entailed. I have no definite plan by which to overcome our present difficulties, except that everybody interested in stumpage meet to discuss the necessity of promoting and protecting our interest. If that is done, I am satisfied it will not be long until we will be organized and accomplishing results.

Stumpage holders, who are not manufacturers, are not spending anything toward promoting the use of wood products, although they are just as vitally interested as the manufacturer, who is cutting up his timber at this time; in fact, more so, because interest is piling up on his holdings, and unless something is done to stop the inroads being made by the substitutes the chances are he will never realize cost out of his timber.

I think we have made a mistake in advertising how rapidly the forests are being depleted, as it has given to the manufacturer of substitutes and the public the impression that lumber is scarce, and therefore high priced.

It seems to be the object of the present selling organizations to try to get a few cents more for their product than their neighbors, and if this is done they seem to be content, believing that end of their business is being properly handled. In most cases the one having the largest selling force and spending the most money to beat the other fellow to the business, or beat him out of it, is considered the most successful in the selling department, although he creates nothing, does not increase the consumption of lumber one foot, and knows when he is taking the business that, sooner or later, the other fellow will either increase his selling force to get the business, or he will cut his price sufficiently low to force it his way. So in our selling methods, instead of increasing our efficiency, benefiting ourselves and the world in general, we are adding to the cost of lumber. What lumberman here to-day has caused an increase in the consumption of lumber in any direction, or what lumberman do you know of who, in the last twenty-five years has caused any increase in the consumption? Only a few years ago had any one suggested to the lumerman the use of wood blocks for pavement he would have been given little consideration; but someone, not interested in timber, introduced creosoted wood paving blocks and proved to the world that they are the best pavement on earth. To-day we know it. As a result, their use has increased all over the world.. The consumption of this item alone means more profit to the lumber manufacturer of all woods than the profits resulting in trying to advance the market price through different sales methods in force during the last ten years.

Just think how much more lumber could be consumed if some one should devise a cheap process of treating lumber so as to make it fireproof. Is it unreasonable to suppose this can be done? The accomplishing of this looks easier to me than the thousands of other things that have been accomplished. The great trouble, in my opinion, is, we have never given it enough thought or consideration. If the lumbermen—and especially those interested in timber—do not put forth any effort in this direction, who can we expect will do it? And this is only one means of increasing the use of lumber; there are many others.

The world to-day is not using half the lumber it could if every one were to use all the lumber actually needed, based upon the present plane of our civilization. We can not produce ideal conditions, but we can overcome many of our present obstacles and put our business on a better paying basis, and at the same time benefit the world as a whole in doing so, if we will only devote our energies in that direction.

The Old Man's Busy Day

"The Old Man is powerfully busy to-day," remarked the bookkeeper to Big Dave who walked in and noting the closed door jerked his head interrogatively toward the private office.

"Busy!" ejaculated Big Dave, "Why, man, this is the fifteenth day of July and no retail lumberman has a license to be busy on a day like this.

"Better go in and find out," suggested the bookkeeper.

Big Dave passed the timid stage so many years ago he has forgotten there is such a stage in the career of travelling salesmen. He knocked and a great voice roared out to him to enter. The sight that met his eyes caused them to distend.

The Old Man glanced up and bellowed: "Sit on your hat, stand in the corner or come back in two hours."

"I'll come back," said Big Dave carefully noting that every chair was occupied.

He spent an hour talking to the yard men, another hour mentally noting the capacity of the empty bins and piling spaces.

A bit later he returned to the office and found the Old Man giving parting instructions regarding a shipment of storm sash. Wheeling in his chair he faced Big Dave and demanded:

"What sort of a price can you make me on ½ x 4 No. 2 strips, S1S and matched?"

"How many?"

"Well, say 20,000 feet, surface measure, and fill the car with 1 x 4 No. 2 flooring."

"We can make the ½ x 4 stuff out of 1¼-inch strips, if we have them and in a rough way I would say the stock will cost you $1.50 more than the current price of the strips."

"Just send me a car," commanded the Old Man.

"Better include a car of that 6-inch No. 2 flooring," suggested Big Dave. "It's extra value stock."

"Send it along. It may come in handy," said the Old Man.

"Now, if I am not killing the goose that has just laid a golden egg, what in the world do you want with all this matched stock?"

"I want to sell it," the Old Man responded with a grin.

"Sure pop," replied Big Dave without annoyance, "but how are you going to sell it, is what I really want to know?"

"All the old barns around here are covered with inch boards. The sun has warped many of them, battens are off in places and the cruel winter winds whistle in and chill poor Molly, Dolly or Dobbins. I've sold stock to ceil the interior on two barns already. One of my customers will turn the rough side out and whitewash the interior, the other expects to paint it. One expects to use the ½-inch stock, the other will buy standard flooring."

Big Dave whistled, thought a moment and then remarked: "Better make that an order for a full carload of the ½-inch stock. You'll need it."

"Not this winter. I've ordered twice as much as I think I shall need."

"Where did you pick up this idea," asked Big Dave as he finished writing the order.

"Went out to call on Bowman one day. He owns 240 acres south of town and raises some stock. Built his barns fifteen years ago. Grumbled about his stock getting cold and was figuring on rebuilding with concrete or tile. His barns are all right. A bit old-fashioned, but good for years of service. We looked them over and decided that the best thing he could do would be to ceil them up on the inside. Then we began to figure, speculatively, on how much food it took to offset the cold that came in through the cracks, and before we were through we decided the cost of the ceiling would be more than offset by the saving in feed.

"I never thought ot that," remarked Big Dave.

"Nobody ain't accused you of thinking," said the Old Man. "It's your job to write orders. Thrushmann is the fellow that does the thinking—sometimes."

"I'm doing a bit now," said Big Dave. "I am thinking what would happen if I should tear up this order and hit you a whollop on the jaw."

"That's not a thought," observed the Old Man. "That is a childish impulse."

"Guess you are right, all right," assented Big Dave, stowing his

order book securely away. "But why didn't you ever think of this before?"

"Well," remarked the Old Man reflectively, "I just didn't. But in the name of all that is reasonable, why didn't you think of it?"

"Well, now you mention it, I didn't think of thinking of it," confessed Big Dave.

"Ceiling the inside of the barn will call for the use of some 2 x 4 or 2 x 6 for nailing rails and the use of a great deal of ½ or 13-16-inch ceiling or flooring, whichever you wish to call it. That will give the barn walls a dead air space and stop the inflow of cold air. A few windows will provide ventilation during the late fall and early spring months—and there you are."

"How do you know the farmers will adopt your idea?" inquired Big Dave.

"Well, I've orders from two of them and half a dozen others biting at the bait I have so temptingly hung before him. 'Nuther thing, whatever Bowman does half the farmers of this county can be persuaded to do. He's a sort of bellwether an' leads the flock."

"May I try to induce Hickman down the line to develop business of this sort?" asked Big Dave.

"You may try to your heart's content, till you are blue in the face, or until the cows come home, but Hickman'll never have the courage or the opportunity to work up the idea in his section. He's what you fellows call a dead one."

"I'll suggest the idea to him, anyway," decided Big Dave. "By the way, why did your bookkeeper call this your busy day and what were all the rail birds doing when I came in?"

"This is the day I buy for the fall trade. The rail birds were writing orders and one or two of them gave me the outline of a selling idea, something I never expect you to part with."—The Lumber World Review.

Circassian Walnut

The Forest Service recently issued circular 212 dealing with Circassian walnut, including its history and commercial uses. As is well known, this is an imported veneer wood, though the quantity used annually in this country is not large. The price is high, for which reason it is never employed in cheap articles. It is among the most expensive woods on the market, though a few others which are handled in very small quantities sell for more.

Circassian walnut comes from the southern provinces of Russia, near the Caspian sea, and from northern India. Its range, if plantings as well as natural growth are counted, extends practically round the world. It grows naturally from the Black Sea to the Pacific Ocean, and has been planted in all parts of central and southern Europe, and in many parts of the United States, particularly on the Pacific Coast. It is the tree which grows the nuts known as English walnuts. It is the same as French walnut, Italian walnut, and Austrian walnut. These are planted trees, while Circassian walnut as it is known in trade is the wood of timber which grows wild. Trees in cultivation do not produce finely figured wood like that which grows in its native habitat.

The highly artistic veneers which have made Circassian walnut famous are cut from short, crooked, misshapen logs; because the smooth, well-proportioned timber lacks fine figure. Logs are bought by weight at Caspian Sea ports, the cost being about four cents a pound, including bark, sap, and all. The wood is heavy and the rough logs are expensive. Before shipping, the sapwood is hewed off and thrown away, and is a total loss to the purchaser who pays four cents a pound for it.

The wood is rich in figure and veneers appropriate for many purposes may be obtained from selected logs.

Want Timber Royalties Suspended

The British Columbia government will be requested by the Revelstoke, B.C., Board of Trade to suspend collection of timber royalty, ground rents and land payments generally until the conclusion of the European war. A resolution to this effect was passed by the Board at a recent meeting. A request will also be made that the Provincial Government waive the penalties payable by timber license holders, and that tax sales of lands be suspended until the financial situation improves.

Compensation Commission Appointments

The appointment was recently announced of Samuel Price, K.C., of St. Thomas, Ont., as chairman of the Workmen's Compensation Commission of Ontario. The position carries with it a salary of $10,000 per year. Two other commissioners, to make up a board of three, are to be appointed. The commission will have jurisdiction over all claims for injuries, through which disputes may arise, made by workmen employed throughout the Province, under the act passed at the last session of the Ontario Legislature.

Death of a Pioneer Bracebridge Lumberman

The death occurred at Bracebridge, Ont., recently of Mr. M. Thompson White, one of the oldest residents of that town, who had been engaged in the sawmill business for the past eighteen years. Mr. White went to Muskoka in 1873, taking up a farm and also engaging in the school teaching profession. In 1885 he went into the furniture and hardware business at Burks Falls, remaining there for two years. Then he went to Muskoka and commenced his lumbering business. The late Mr. White was very widely known throughout the district and will be mourned by many friends.

Sudden Death of A. M. Todd

Mr. Alexander M. Todd, who was a travelling representative of the Chas. F. Luehrmann Hardwood Lumber Company, of St. Louis, Mo., died very suddenly on August 15th, in his home at Chicago. He had been spending the summer at Lake Harbor, Mich., with his family, and returned to Chicago for a few days on a business matter. He leaves a wife and one daughter. Mr. Todd was very well known in the lumber consuming trade through the Eastern and Central States and Canada.

B. C. Products to be Shown in Export Markets

Samples of British Columbia fir, spruce and cedar for the export trade, are being prepared and will be forwarded to Dominion trade commissioners wherever they may be located. This action is taken in co-operation with the minister of trade and commerce at Ottawa. The samples will be sent to a number of points in China, Japan, South Africa, South America, the British West Indies and the Netherlands, besides points in Great Britain and Europe, and will show both the finished and unfinished product. The provincial department is desirous of combating the notion which has largely prevailed that only big timbers were shipped from this province.

Important Project for Newfoundland

A despatch from St. John's, Newfoundland, says: "The investment of millions of dollars is being planned by a group of Canadian capitalists for the establishment of large paper pulp and allied enterprises on the west coast of Newfoundland, if the Government will grant the necessary concessions."

Quebec Timber Sale Postponed

The auction sale of timber limits, which was advertised by the department of lands and forests of the province of Quebec to take place on August 11th, was postponed until October 20th.

Alfred Dobell & Company, Liverpool, under date of August 1st, say:—What was otherwise an uneventful month in our trade closed under the shadow of a grave international crisis. With a bank rate which bounded in three days from 3 per cent. to 10 per cent., and a situation charged with anxiety and uncertainty, business for the time being has been brought to a standstill. Under such circumstances it seems futile to review the course of business during the past month, or to attempt to forecast the future.

Mr. R. M. Hamilton, who is well known to the trade and for many years occupied the position of General Superintendent of the McGregor Gourlay Company works at Galt, Ont., has been appointed Works Manager of the Canada Machinery Corporation, Limited, with supervision of the manufacturing departments of their various plants. His headquarters will be at Galt, Ont.

The Smart Turner Machine Company, Limited, Hamilton, Ont., are supplying M. & M. A. Deans, Sprucedale, Ont., with one of their Duplex Steam Pumps.

Mr. T. A. Burrows, Winnipeg, Man., one of the best known lumbermen of central and western Canada, recently visited Toronto. In spite of the many pessimistic reports, which have come out of Western Canada of late, Mr. Burrows takes a very hopeful view of the trade situation. He considers however, that it is of great importance for the business man to-day to keep an extremely careful eye upon his liabilities. He is confident that the West as a whole will pull out of the present unsatisfactory trade condition rapidly, but stated does not expect any important improvement until it is known to what extent Great Britain controls the war situation.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers Ltd., Toronto, Ont. 7-tf

Wanted

One or two blocks of Spruce, also Pine, must be well manufactured. Apply Box 31, Canada Lumberman, Toronto. 11-t.f.

Wanted

One or more cargoes of 1 and 2 in. Spruce for delivery at a Lake Erie Port.

E. C. BRADLEY LUMBER CO.,
14-17 Cincinnati, Ohio, U.S.A.

Wanted

1,000,000 ft. Spruce, 1-in., 1¼-in. and 2-in. If not already cut will give sawing instructions. Apply Box 30, Canada Lumberman, Toronto. 11-t.f.

Wanted

Soft Elm, 4/4 log run.
Birch, 5/4 log run.

Quote lowest prices F.O.B. mill for dry or new cut.

E. M. NICHOLSON,
Board of Trade Building,
9-t.f. Montreal, Que.

Wanted To Buy—1000 Birch Logs

fresh, clean, straight and sound, 14-in. and up diameter at small end, 8 ft. to 16 ft. long. Delivery to commence as soon as possible. Terms: 75 per cent. cash when alongside track at railway station, balance when loaded on cars. Write P. O. Box No. 1595, Montreal, stating best price. t.f.

To Manufacturing Lumbermen

Wanted—Clear Birch, kiln dry preferred, cut to following measures: can take about 22,000 pieces per year in two deliveries, viz.: 8,000 cut 21 in. x 5 in. x 3 in. and 3,000 cut 28 in. x 5 in. x 3½ in. Quote prices C.I.F. London, Eng. Address Geo. Care Ltd., Victoria St., Norwich, Eng. 15-17

Do You Want to Buy or Sell?

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department."

For Sale-Machinery

WOODWORKING MACHINERY FOR SALE: 1 24-in. Ideal planer, matcher and moulder; 6 30-in. Ideal pedestal bandsaws. 1 MacGregor-Gourlay variable power feed rip saw; 1 No. 51 Crescent universal woodworker; 1 36-in. Egan double drum sander; 1 10-in. Hespeler four-side moulder; 1 Cowan panel raiser; 2 16-in. Ideal wood lathes; 3 upright power mortisers. H. W. Petrie, Limited, Toronto. 17

Second Hand Machinery

150 to 175 h.p. Corliss Engine, 16-in. x 36-in., new two years ago.
75 to 100 h.p. Brown Automatic, 13-in. x 30-in., in excellent condition.
500 to 750 h.p. Buckeye; a good sawmill engine.
Boilers, 72-in. x 18-ft. and 54-in. x 14-ft.

THOMAS HOBBS,
Mail Building,
7-t.f. Toronto, Ont.

Wanted-Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents.

Experienced lumberman is open for position on road, or would take management of retail yard. Address Box 65, Canada Lumberman, Toronto. 17

Experienced lumberman wants position. 12 years practical experience as bookkeeper, manager, and superintendent of woods operation. Also full knowledge of the hardwood business. Box 74, Canada Lumberman, Toronto, Ont. 17-17

Position wanted as practical sawmill foreman. Twenty years' experience. Can furnish the best of references. Address Box 51, Canada Lumberman, Toronto. 14-t.f.

Wanted position as shipper or foreman or both in small plant, soft or hardwoods, twenty-five years' experience. Can furnish first class references. Box 56 ,Canada Lumberman, Toronto. 15-17

EXPERIENCED SUPERINTENDENT wants position to take charge of lumbering operations, bush, mill, etc. Desires a change. Can get results and furnish the highest credentials. Box 46, Canada Lumberman, Toronto. 13-17

Wanted-Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

Pulpwood General Superintendent wanted for the supervision of a very large operation. Must have thorough experience and be a pulpwood specialist. Operation is a large one and requires good operator and good business man. State in full experience, present position, age and other particulars. In confidence. Apply, Cheap Pulpwood, care of Canada Lumberman, Toronto. 17

Business Chances

For Sale

Timber Limits, principally Hemlock, also Pine, Spruce and Hardwood. Also Saw-mill, logging and driving outfit. For particulars address Box 52, Canada Lumberman, Toronto 14-17

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest. If your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf

For Sale

Rare bargain. Band mill located in best lumber and log center on Puget Sound. Rail and cargo shipping facilities. Excellent log pond. Ten and a half acres of land. Price one-fourth of appraised valuation. Must sell quick. Box 765, Canada Lumberman, Toronto. Ont. 8-t.f.

Tenders for Fallen and Burnt Timber

Tenders will be received by the undersigned up to and inclusive of the 15th day of September, 1914, for the burnt and fallen timber on Berths 2 and 4, Township of Nipissing.

Also tenders will be received for Berths 2 and 4, Twp. Nipissing and Berth 4, Twp. Gurd.

The highest or any tender not necessarily accepted. For particulars address

ALEX. BLANCHARD,
Box 265 North Bay, Ont.
15-18

Sale of Pulp Timber

Sealed tenders will be received by the Minister of Lands at Victoria, B.C., not later than noon on the 30th day of November, 1914, for the purchase of nine (9) pulp licenses, situated on the Coast of British Columbia, and estimated to contain the following:—

Hemlock..	87,301,000 ft. B.M.
Balsam Fir	44,444,000 ft. B.M.
Spruce	43,244,000 ft. B.M.
Cedar.	27,779,000 ft. B.M.
Douglas.. Fir	2,779,000 ft. B.M.
Total	205,547,000 ft. B.M.

This timber is within ten miles of salt water and is tributary to Vancouver.

Thirty (30) years will be allowed for the removal of the timber.

For full particulars and maps address H. R. MacMillan, Chief Forester, Victoria, B.C. 17-20

Miscellaneous

For Sale

A magnificent Pulpwood Property situated in the Gaspe Peninsula, containing an area of about 921 square miles. The property has been valued by one of the leading lumbermen of Canada at over $6,000,000, and the owners will be glad to hear from first-class firms desiring to purchase such a property. The price asked is $1,500,000 cash, and full particulars will be sent to responsible parties who will be given every facility for having the property cruised immediately. Address, P. O. Box 638, Halifax, Nova Scotia. 17

Saw Mill Machinery For Sale

Sawmill near Sellwood, Ontario, daily capacity 60,000 feet. All machinery including:—Log Ladder, Bullwheel, Steam Kicker, Log Loader, Stationary Steam Nigger, 42-in. Steel Carriage, 10-in. Steam Feed, 8 ft. Double Cutting Bandmill, Cast Iron Lumber Table, 5-Saw Slab Slasher, 48-in. Big Champion Edger, Trimmer, Transfers to Edger and Trimmer Tables, Sorting Tables, etc. Also, Independent Lathmill, Filing Room Outfit and Power Plant complete. This machinery is of the latest design, practically new and in excellent condition. Offers will be accepted for all or any part of this machinery, where it stands or F.O.B. cars Sellwood.

The Waterous Engine Works Company,
22-t.f. Brantford, Canada.

Storing Moulding and Frame Stock

There used to be quite a lot of argument between retailers and the people who wrote stuff for retailers about moulding stock and whether it should be kept in bins or standing on end in sheds. The opinions of the best authoritiees seem to favor end piling of moulding. The best thing of this kind the writer has seen lately was enclosed bins for moulding stock.

It was in the yard of a very upto-date retailer who in times past has experimented with moulding stock in racks, in bins and standing on end. After having years of experience, when he built a new shed he equipped bins for his moulding stock pretty much as bins are equipped for keeping door stock protected from both light and dust. The bins for the moulding and the frame stock were partitioned off with sealed partitions and just far enough apart to swing a pair of doors together and all the bins holding moulding and frame stock were closed up with doors so that they were both dark and dust proof.

It takes a little more time and costs a little more money to equip bins for moulding and frame stock in this way, but it seemingly pays, for it keeps the stock bright and fresh and it is really not much more trouble to get at than if it were all exposed. The patterns and sizes can be marked on the door so that one

may know the contents at a glance. Then it only takes a moment to open the door to whatever bin stock is wanted. The stock being kept up in the dark protected from the dust is found to be just as bright and clean as when it came into the yard, which makes it a pleasing stock to sell at all times and prevents waste and loss of value through being black and dirty with age.

British Columbia Red Cedar Slates

British Columbia is regarded as the last stand of red cedar in North America, says a recent report, and it is predicted by mill men that within the next few years hundreds of new mills will be established in this province to participate in the profits to be derived from the manufacture of cedar shingles, i.e., wood slates. It is predicted by those who have investigated the subject that British Columbia will have almost the exclusive market of the continent for its red cedar lumber and shingles, and with the opening of the Panama Canal the industry will probably receive great stimulus. Cedar logs and shingle bolts are not exported except from Crown lands, and this prohibition will result in more mills coming to the province, as the product must be manufactured here. Washington State has 435 shingle mills with a daily output of 15,000,000 shingles. Whatcom County, Wash., has 113, as compared with 60 in British Columbia. More than half of the shingles produced in this province are exported to the United States, and as there still remains a plentiful supply of cedar timber in British Columbia the industry promises to increase in importance and to become ultimately one of the most profitable in the province.

Saving of Timber by Using Thin Saws

By making the width of face small two objects of very great importance are attained. In the first place, as small an amount of material as possible is converted into sawdust and thereby almost entirely wasted. This waste in sawdust does not appear at first sight to be of extreme importance when one watches only a few planks being cut; but when one sonsiders this waste is repeated millions of times in the course of a year in a single sawmill the absolute necessity of economy in this direction becomes evident enough. If, for example, a 14-in. square log is to be converted by sawing into 5/8-in. planks, if the saw cut away 1/1/-in. only between each plank, twenty planks will be got from the log; if it cut 1/8-in. away only eighteen boards 5/8-in. thick can be got out of it; and if 3/16-in. be lost in sawdust then only seventeen boards will be obtained. Thus in the first case about 9, in the second 17, and in the third about 23 per cent. of timber is lost in the shape of sawdust.

If these logs were 12 ft. long, then in the first case, there being twenty-one cuts, each 14-in. deep and 1/16-in. thick, there will be more than 1/ (exactly 1 17/32) cubic feet of timber converted into sawdust for every log. In the second case there would be 2¾ cubic feet lost, and in the third 3 15/16 cubic feet would be the waste in sawdust.

If now we suppose that a single saw frame cuts up fifty of these logs per day, and works 250 days per year, the losses per year in the above three cases would be 1,150, 34,350, and 49,150 cubic feet of timber per annum. Taking this at the price of 2s per cubic foot, which is a fair average for yellow pine, we find that the above three yearly losses are represented in money by £1,915, £3,435, and £4,915. This example serves to show the extreme importance of saving by making as little sawdust as possible.—From Cutting Tools, by R. H. Smith.

R. O. SWEEZEY
164 St. James Street,
MONTREAL

Cleans a building of Rats and Mice in short time, keeps it cleaned, for it is always ready for use. Made of galvanized iron, can't get out of order, lasts for years. Large number can be caught daily. Go to Catcher mornings, remove device inside, which only takes few seconds, take out dead rats and mice, replace device, it is ready for another catch. Small piece cheese is used, doing away with poisons. Catcher is 18 inches high, 10 inches diameter. When rats pass device they die, no marks left on them. Catcher is always clean. One of these Catchers set in a livery stable in Scranton, Pa., caught over 100 rats in a month. One sent prepaid to any place in Canada or United States upon receipt of $3. Catcher, 8 in. high, for mice only, prepaid $1. On account of shipping charges being prepaid, remittance is requested with order.

H. D. SWARTS,
Inventor and Manufacturer, Scranton, Pa.

Ontario Lumber Company Limited

In Liquidation

The undersigned invites tenders for all or any of the following Timber Limits in the District of Parry Sound, Province of Ontario:

Township	Berths	Area (sq. miles)	Estimated quantity timber
McConkey	1, 2, & 4	56¼	About 117,000,000 feet, including 70 million feet of Hemlock and about 15 million feet Birch
McConkey	Part 3	4¼	
Hardy	3	20¾	About 33 million feet, including 15 million of Hemlock and about 9 million feet of Birch
			Less 10 million feet in above 2 townships
Mills	1	23½	About 54 million feet, including about 31 million feet Hemlock and about 11 million feet Birch
Pringle	1 & 2	43¼	About 38 million feet, including about 16 million feet Hemlock and about 12 million feet Birch
Lount	3	18¼	About 28 million feet, including about 13 million feet Birch
Machar	Part 2, 4	15	About 5 million feet—Hemlock and Birch
Gurd	1	18¼	About 5 million feet—Hemlock and Birch
Henvey, or Broken Front	6	73	About 7 million feet—mostly white and red pine

The above areas, timbered, are covered by Government Licenses renewable from year to year. Estimates are taken from the Company's records.

The undersigned also offers for Sale, on behalf of the Creditors of the Company, the French River Mill property and equipment, the property of the above Company.

The lowest or any tender not necessarily accepted.

BRYAN PONTIFEX, C.A.,
Liquidator
2 Leader Lane, TORONTO

Review of Current Trade Conditions

Ontario

The first effect of the outbreak of war upon the lumber trade at Ottawa, and in fact throughout Ontario, was an almost immediate reduction in the volume of the trade, and a premature feeling of pessimism, which was soon replaced by a steadily growing feeling of confidence. Recent Ottawa reports are to the effect that the outlook is improving. The export trade is becoming active again, since the rate of exchange on foreign drafts became almost normal. Several other factors have assisted in improving the export business. Insurance charges are getting back to their former rates. Trade routes are being kept open, and the British state insurance scheme has been extended to colonial shipping. Several sailing vessels have recently left from Montreal and Quebec for British ports with loads of lumber, and lumbermen are expecting exceptional opportunities for developing their trade abroad. Frequent inquiries for all kinds of lumber, principally for use in shipbuilding, have recently been received at Ottawa. Extremely low water in the Ottawa river and its tributaries continue to handicap the mills. In fact the water recently reached a record low level. Most of the large mills however, report that they hope to be able to keep open for the rest of the season. Latest reports are that woods operations this year will be considerably less than in any previous year, on account of the fear that the cost of provisions will advance and also on account of uncertainty as to next year's demand for lumber. However, there will be greater activity in the bush this year than was expected when the war broke out. Details of the contemplated operations of several of the large Ottawa companies, will be found in our Ottawa correspondence in this issue.

Eastern Canada

The lumber trade in Montreal has felt the disturbing effect of the war acutely. The retail trade is very quiet, as building operations have been greatly reduced. The large consuming manufacturers have also felt the effect, and are not ordering stocks of lumber to any extent. The export trade has suffered by the interference with ocean transportation. The pulp and newsprint market have been greatly strengthened, on account of the American consumers having been cut off from their European supplies.

The demand for Eastern spruce at Boston is poor. Prices continue steady at $23.50 for dimension. Manufacturers feel confident that, in September, spruce prices will be firmer. Random spruce is not selling so well as a short time ago. Quotations are: 2/3, $20.50 to $21; 2/4, $21.50 to $22; 2/5, 2/6, 2/7, $20 to $21; 2/8, $22 to $22.50; 2/10, $23.50 to $24; 2/12, $24 to $24.50. Spruce covering boards are not selling well.

At New York the spruce market continues dull. Prices are steady but buyers are not active. Activity is reported in the demand for lath at Boston as a result of the buyers fearing that they might not be able to get delivery of stocks ordered in Canada. For 1⅝-in. lath $4.10 is now the top price, and very little business is reported at less than $4.05. A fair volume of shingles is being sold. The demand being best for white cedars. The choicest extras are selling at $3.60 and some good extras at $3.45. Arrivals of red cedar shingles are scarce, $3.63 to $3.70 is the top price for extras.

Great Britain

The measures which have been taken by the British Government for the relief of the financial disturbance resulting out of the war, have done much to clear the situation. Business has progressed much better than was expected when the war was declared. From outward appearance the banks are conducting business now in the usual manner. It is not possible as yet however, to estimate the effect of the war upon the wood trade. It is certain that spot prices must advance, and it appears equally certain that northern supplies of wood will not be entirely cut off. Cargoes from the White Sea have been arriving at London. The London trade continues on a fairly satisfactory basis, but is very largely for cash. An interesting result of the war is the creditable settlement of industrial strikes in London. The trouble between the Master Builders' Association, and some of the trades unions has been settled after a seven months struggle, and much work has been resumed.

At Liverpool, the trade at latest reports was confined entirely to merchants and consumers. Shipping agents have, for the time being, to content themselves with looking on. Merchants are getting rid of a considerable quantity of stock, chiefly softwood for ship work, at good prices. The lowering of the Bank rate was a great relief to the trade, removing the financial strain under which many operators were carrying on their business. Recent imports into Liverpool were said to be much too heavy, but this is more than likely to be offset by the shortage of imports which can now be expected. Instructions have been sent out to shippers to hold back all goods for shipment against contracts, until further notice. Many importers are declining to accept liability for war risk insurance. Spot prices have advanced all round and an advancing market is expected during the continuance of the war. Forward business has come to a complete stand-still. Prices have advanced £2 per standard for spruce and Rigas. Stocks are heavy.

At Glasgow, business during the past fortnight has been entirely under the influence of the war, very little inclination to buy or sell being noticed. Some movement in Canadian and Riga spruce is reported at advanced prices, which is to be expected, but in other directions, although higher prices are asked, no inclination to buy has developed. Stocks of first quality Canadian pine are abnormally small and would justify stiffer prices under ordinary conditions, but the demand has fallen off greatly during the last year or two.

United States

During the past fortnight there has been a great deal of hesitation in the lumber trade in the United States, as a result of the war in Europe, but this hesitancy is expected to pass away before long. Great improvement is reported in the export business, since the first few days of panic. War risk rates on lumber were placed at 10 per cent. on August 11th, but in less than a week they had fallen to 4 per cent. and a further reduction was expected. Exporters have received cables from their Irish and English agents, asking them to let shipments go forward properly covered by war risk, and saying that the accounts would be duly honored. The latest reports indicate that some of the large exporters will resume shipments to England, Ireland and Scotland, as well as to some French ports almost at once. European countries will use large and increased amounts of lumber, and as their supplies from the Baltic have been shut off; they must look to the United States and Canada. Another important factor in connection with United States trade is the improved condition in Mexico, which is expected shortly to come into the market for American lumber.

As to the interior trade, June and July were really good months and the demand during August was fair. Retail stocks are reduced and a steady volume of trade is in progress. There has been no material change in the northern pine markets. The same applies to hemlock. Prices remain unchanged. Improvement is looked for in September, as the outlook for building operations is better. At Buffalo, the volume of trade in Northern Pine is below normal and does not show much tendency toward improvement. The demand for box lumber is steady and stocks are small. At North Tonawanda a tendency is reported towards taking orders ahead for stock, due probably to a prospective shortage of cars. Most purchases however, are for current requirements. Prices are steady. The hemlock trade at Buffalo is quiet and recent prices have not been satisfactory, as stocks are plentiful. The demand from retailers is fair and they report business holding up well.

There is a fair local demand for hardwood at New York. Yard stocks are low and the factory trade has commenced to move. At Buffalo, the hardwood trade shows little improvement. The export business is very quiet and prices are only steady. Some curtailment of mill output is reported. Oak and maple are most in demand. Hardwood prices at Boston are firm. Exports are practically at a standstill.

Barbados Market Report

S. P. Musson, Son & Company, reports as follows under date of Barbados, August 7th: Lumberstuffs.—White pine—There have been no arrivals during the fortnight, but stocks on hand are sufficient for present requirements. Spruce—The only receipt is a small lot of 42 m. ft. ex Trn. Schr. "Ainslie" from Port Hawkesbury, which was sold at $22.10 round. Pitch pine—The only arrival is a small lot of 57 m. ft. by the S.S. "Mecklenburg" from Mobile. Shingles—Arrivals consist of the following: Schr. "A. V. Conrad" from Campbellton with 1,567 m. Extra No. 1's which had been contracted for since last year. Trn. Schr. "Emily Anderson" from Port Hawkesbury with 2½ million Extra No. 1's which had been sold to arrive at $2.55. Trn. Schr. "Ainslie" from Gaspe with 617,000 Long Gaspe shingles, which fetched $4. The market is heavily overstocked, and we fear prices must decline. Shooks

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

A Better Outlook for Trade at Ottawa

Ottawa, Aug. 24 (Special to the Canada Lumberman): Immediately following the announcement of war between Great Britain and Germany, activity in the lumber business in Ottawa and district, as elsewhere no doubt, was greatly reduced. Lumbermen naturally became pessimistic of the results, prematurely it would seem, for now they are ready to admit that things are gradually improving and the outlook is not such as to encourage pessimism, but the contrary. The export trade, which was practically halted when hostilities commenced in Europe is becoming active again, through the rate of exchange on foreign drafts getting back to almost normal; insurance charges almost down to their formal schedule; the trade routes being kept open in comparative safety across the Atlantic for British vessels, and the extension to colonial shipping of the British scheme of state insurance. During the past week there have been several sailings of vessels loaded with lumber from Montreal and Quebec for British ports. Lumbermen are now beginning to see great opportunities for developing their trade abroad. Many inquiries have been received here since the war began for all kinds of lumber, to be used principally for shipbuilding.

The most serious impediment to the trade in the Ottawa Valley just now is the low level of the water in the Ottawa river which is at a mark low enough to constitute a record. Several firms, among them that of J. R. Booth, are being seriously handicapped in their operations by the lack of water, but they will do their best to keep open for the balance of the season. In some of the tributaries to the Ottawa there is barely enough water to float enough logs to keep mills going.

Operations in the bush this year will be considerably less than they have ever been before, owing to fear that the cost of provisions will be high; also to apprehensive feeling concerning next year's demand for lumber, due to the state of the money market brought about by the war. But there will be more activity in the bush this year than was expected three weeks ago when the war began. J. R. Booth, will not operate more than eight or 10 camps this season. It was his intention to have from 3,500 to 4,000 men in his limits had the war cloud not broken. It is too risky he says, to place too large an army of men in the woods, with the prospect of provisions soaring to an almost prohibitive height. Shepard and Morse, however, already have about 450 men in their limits along the Kippewa and Quinze rivers, compared with 425 at this time last year. The W. C. Edwards Company will not operate in the bush more than is absolutely necessary, and this may be said of almost all the firms in this district. The Hawkesbury Lumber Company and McLachlan Bros. intend to be as active this year as they were last. This is partly due to considerable timber on their properties suffering by fire and storm early this year.

Mackenzie's Limited, of Ottawa, contractors for lumbermen's supplies say they have orders on their books for more goods than they did at this period a year ago, but, since the war, several of these orders have been held up. This firm say that they know already that lumbering will be very much reduced in the camps this season. Wholesale grocers and provision merchants such as H. N. Bate and Sons, F. J. Castle and Company, both of Ottawa, admit that the demand so far for camp provisions is considerably behind that of previous years up to this time. W. H. Dwyer, the largest dealer in grain in this part of the country says it is a little early for him to expect any business from the camps, but he will be surprised if he gets as many orders as in other seasons.

The Maclaren Lumber Company, of Buckingham, Que., have just completed a big dam and slide on the Lievre river, which are said to be unique in some respects in the lumber world. The new work is a part of a scheme for conserving the huge limits held by the company on the Lievre. There are three important features to this dam, says Mr. J. B. McRae, of Ottawa, the engineer responsible for the undertaking, which are the flood gates, the power flumes and the log chute. The chute is a permanent structure of reinforced concrete, with a V-shaped trough. It is said this concrete chute is the only one in the world being used for logs. Fifty thousand logs can be delivered through it in 10 hours, compared with 15,000 in the same time in the old wooden chute. The logs at one point can travel at a rate of 38 miles an hour. Power can also be developed at High Falls to the extent of 100,000 horse-power. The falls have a drop of 160 feet. The water can be turned through five flumes, each capable of driving a 10,000 h.p. electric unit. A detailed illustrated description of this work will be published in a later issue of the Canada Lumberman.

In addition to this work the same company are connecting all parts of their limits by telephone with the head office at Buckingham, so that in case of fire help can be quickly despatched to any point. The telephone line is about 90 miles long. Every centre of habitation in the district is connected on this line.

Fire was discovered in Campbell and Stearn's limits at Thirty-One-Mile lake, north of Ottawa, last week by one of the rangers of the Lower Ottawa Forest Protective Association. He quickly got help and prevented what promised to be a very serious fire. Careless sportsmen are blamed for starting the outbreak. The chief fire inspector of the same association recently prosecuted 40 settlers in the Gatineau district for burning slash and debris in valuable timber limits. In each a conviction was registered and a penalty imposed.

Montreal Trade Feeling Effect of the War

Montreal, Aug. 26th (Special to the Canada Lumberman): The war situation is having a very disturbing effect on the lumber business. Retailers are buying from hand-to-mouth, and this will probably continue until such time as there is more definite news as to how the conflict is likely to go. Every branch of commerce is affected by the European outbreak, and as lumber is one of Canada's most important industries, it follows that the trade feels the situation acutely. Many important building projects have been postponed, and in other instances work has been wholly or partially stopped. Building permits show a serious decline, and even those issued are for comparatively small amounts. Collections are very slow.

Industries which are large buyers of lumber, such as car building, are almost at a standstill, the railway companies finding it impossible to secure the necessary capital from Great Britain.

The sash and door section is very quiet and new orders of any extent are practically unobtainable.

The export trade is upset by the disorganization of ocean transportation, the schedules of the regular lines having been put quite out of joint. Lumber is still being sent, but there is uncertainty as to how long shipments will be made. The steamship companies have made a strong attempt to advance rates.

So far as can be learned at this date, the number of men to be employed at the logging camps next season will be reduced. Some of the lumber companies are holding their orders for equipment, etc. The rise in the price of provisions is a serious matter for the companies, but against this must be set the lower wages which will prevail.

The pulp and newsprint markets have continued to strengthen under the stimulus of war conditions. Sulphite of the higher grades is very scarce, and is likely to continue so until imports from Europe are available. Prices have risen from $10 to $15 per ton.

Ground wood is also very firm, advancing about $2 per ton.

There is a very large demand for newsprint, with many inquiries from Italy, England, South Africa, and South America. Some orders for the three last named have been accepted by the Laurentide Company. Naturally, quotations have materially advanced. Canadian and United States mills will probably be able to meet the outside demand as well as to supply home markets.

Canadian Railway Ties May Find English Market

The Canadian Trade Commissioner at Glasgow, under date of July 21st, reports as follows: In view of the fact that an increased and more direct steamship service between this port and British Columbia will take place when the Panama Canal is open, it might interest British Columbia lumber shippers to know what specifications are required for railroad sleepers, or ties, in this market. At present the trade is for the most part with the Baltic for sleepers made from what is known as red wood.

The blocks from which the sleepers are to be cut should be of good sound timber, straight, free from shakes, large or loose knots, or other blemishes, and reasonably free from sapwood, water and dirt. The sleepers should be cut from blocks not less than 8 feet 11 inches long, each block being sawn up the middle so as to form two sleepers. The blocks should be of such transverse dimensions that at least 90 per cent. of the sleepers shall be, after sawing, 10 inches broad and not less than 4⅞ inches thick, with a flat surface on the upper side

"None So Deaf

As those who won't hear."

If you hear, you will understand; if you understand you will buy; if you buy you will know what we mean by Fenderson value.

You must see the Fenderson Spruce, the smooth dressing, the dryness, the high-line, uniform grade to appreciate Fenderson Value. It is not sold on a competitive price basis, but on a competitive Value basis.

It's a pleasure to handle Fenderson Spruce—from the time you first look into the car 'till long after the last piece has been sold,—it's good, uniformly good,—you will like it,—your customer will like it,—the Good-will resulting from the sale of this Quality Stock is an asset worth having.

Make that next car a Fenderson car.

You'll like it!

WE CARRY THE LARGEST AND BEST ASSORTMENT OF DRY SPRUCE IN CANADA

not less than 7 inches in width throughout the entire length of the sleeper. The remainder, which must not exceed 10 per cent. of the total quantity, should be, after sawing, 10 inches broad, and not less than 4¾ inches thick, with a flat surface on the upper side not less than 6½ inches in width throughout the entire length of the sleeper. The sleepers should be accurately gauged, and all those which do not comply with the requirements specified above should be rejected. Some buyers do the sawing of the blocks here. Other details would be a matter of correspondence between buyer and seller.

Canadian Stocks in London Will Benefit from War

Churchill & Sim, London, Eng., in their monthly wood circular under date of August 1st, say:—The deliveries in London during July are about equal to the total for July, 1913, the quantity for the seven months showing little variation in the aggregate. Prices improved to some extent largely owing to a diminished importation, and the difficulty experienced by buyers in chartering, especially from Russian ports. Fears of European complications were largely responsible for this, and the beginning of August finds a situation entirely unparalleled in the history of Western civilization; public opinion in England has never wavered since the crisis began in recognizing that her treaty obligations and the path of duty and honor lay in her ranging herself on the side of France and Russia so that the early days of this month find the five greatest nations of Europe engaged in a deadly struggle. The effect upon the wood trade can scarcely be gauged at the present time, beyond the obvious deduction that the partial cutting off of the northern supply must enhance the value of stock held in this country, and mitigate to some small extent the losses which the general trade of the country must suffer as the result of a war of such magnitude.

The month's imports from the St. Lawrence were:—
Pine deals, 130,000 pieces, against 194,000 pieces in 1913.
Spruce deals, 82,000 pieces, against 159,000 pieces in 1913.
Birch planks, 34,000 pieces, against 118,000 pieces in 1913.
and from New Brunswick—
Pine deals, 3,000 pieces, against none in 1913.
Spruce deals, 134,000 pieces, against 276,000 pieces in 1913.
Birch planks, 293,000 pieces, against 252,000 pieces in 1913.

The supply of pine and spruce deals was small during July; there was little change to record in prices until towards the end of the month, when European complications threatened to cut off the competing supply of whitewood from the North of Europe, and all quotations were withdrawn. Business, now that a great war is in progress, has been suspended, but Canadian and American shipments are reaping the benefit of the cessation of supply.

Liverpool and Manchester Stocks

H. W. Lightburne & Company, Liverpool, England, through their Canadian representatives, John E. Moore & Company, Limited, St. John, N.B., report as follows regarding stocks at Liverpool and Manchester during the month of July:

Spruce and Birch
Month Ending 31st July, 1914
Liverpool

	Import			Consumption			Stock		
	1912.	1913.	1914.	1912.	1913.	1914.	1912.	1913.	1914.
N.B. & N.S. Spruce & Pine, Stds. ..	2,730	5,850	3,710	4,750	3,630	3,740	9,590	9,190	8,040
Birch Logs, Loads	940	60	80	560	100	160	1,620	560	600
Birch Planks, Stds.	449	261	273	552	376	206	824	800	436
Manchester									
Spruce, Stds. .. .	6,270	6,460	3,680	6,650	5,440	7,190	11,260	9,420	13,690
Birch Logs, Loads..	600	100	100	420	120	280	900	520	980
Birch Planks, Stds.	127	18	158	97	79	188	594	424	600

Stocks in Manchester and Liverpool combined on August 1st were as follows:—

	1910.	1911.	1912.	1913.	1914.	
Spruce						
Manchester	9,970	13,860	11,260	9,420	13,690	
Liverpool	7,740	7,960	9,590	9,190	8,040	
	17,710	21,820	20,850	18,610	21,730	Stds.
Birch Logs						
Manchester	80	400	900	520	980	
Liverpool	340	1,040	1,620	560	600	
	420	1,440	2,520	1,080	1,580	Loads
Birch Planks						
Manchester.	800	151	594	424	600	
Liverpool	333	291	824	800	436	
	1,133	422	1,418	1,224	1,036	Stds.

Regarding the above stock sheet they say, it might be remarked that the import of spruce to the Mersey and Manchester for the month was less by 4,920 standards, while there was an increase in consumption to the extent of 860 standards—both healthful signs. The combined stock, however, stood at 21,730 standards, which, in normal times, would be ample, if not more than ample; but in these abnormal times, with other competing supplies cut off, the position assumes a vastly different aspect.

July Trade in Liverpool

Smith & Tyrer Limited, Liverpool, England, make the following report upon the British lumber trade during the month of July:

The month showed a steady trade without much animation or change. It closes with the imminent danger of a European war facing us and the course of business has been suddenly and violently disturbed. Pitch pine has been in better demand, largely owing to the efforts of the buyers in the outports to cover their requirements against improving prices. Hewn timber.—There is a sufficient supply. Sawn timber is heavy in stock at the line ports and values have only kept firm, but elsewhere there is an improvement. Prime lumber maintains its value without much enquiry. Lower qualities are much too heavily stocked and prices are barely maintained. Hardwoods generally are depressed and stocks ample. Spruce deals have stiffened in value for cargoes owing to the advanced freight rates, but liner parcels move off without much competition at unchanged prices.

Business Conditions are Sound

From every source at present one receives the opinions of people in a position to estimate reasonably the outlook for business on the American continent. Many letters from lumbermen will be found in this issue, all of which point clearly to a widespread feeling that all is well with us from a business point of view. It would be folly to indulge in exuberant optimism under present conditions, but it would be worse than folly to take an opposite view and expect and invite trouble. The proper stand to take to-day is to be conservative, cautious and hopeful, prepared for any eventuality, but doing our individual share towards assisting in the restoration of business activity which it is reasonable to expect. In the press of the United States this view has been widely expressed and is well represented by an editorial article which was published recently by the Chicago Herald, as follows:—"Sit tight! Don't rock the boat! That's the watchword to-day. That's the first duty of every American at this moment. That's what this country needs to keep it straight and safe and true to its course—absolutely all it needs.

"Business conditions are sound. We have one of the greatest grain crops in history. Its value has already greatly advanced. We have a sound financial system, backed by the greatest store of gold in the world. Our banks are solid, safe. There is nothing the matter with the United States.

"War will mean an unprecedented demand for supplies. Experts declare American business will feel a great impetus. While other nations destroy, this country will produce. While other nations are armed camps, this country will be a farm, a factory, a forge. Trade extension is predicted in all directions. The immediate future is plain.

"The national administration is acting wisely, promptly. The sum of $500,000,000 is available, under the Aldrich-Vreeland act, for an emergency. The organization of the reserve board will soon be complete. This will enable us to deal more effectively with the outflow of gold. Plans are perfecting to permit American registry of foreign vessels. This will protect and develop our commerce.

"We are preparing to maintain strict neutrality. Questions may arise with foreign nations as to what constitutes contraband. Such questions cannot conceivably involve us in difficulties. They will be settled by the ordinary processes. The general principles of neutrality and neutral commerce are plain. The United States will adhere rigorously to them. Friendly intercourse, as far as circumstances permit, will be its rule and its procedure.

"Stock exchanges have closed—a wise precaution. This country cannot be the dumping ground of the whole body of securities that war-mad Europe is anxious to convert into money. The closing is temporary. Elsewhere there is no prospect of interference with the orderly processes of American business. Stable conditions are here. All we have to do is to keep them stable.

"The administration has decided to appeal officially to the public to help maintain existing satisfactory conditions. The public cannot fail to respond. The only danger is one which it may create itself. Its course is simple. All it has to do is to sit tight, to do nothing to disrupt the fortunate condition in which this country happily finds itself.

"Don't rock the boat—that's the central idea! The swell from the great battleship, 'Europe,' will be felt. But it will not hurt us. It need not even break over the sides. There's nothing the matter with the boat that we are in. Straight and strong, well-seamed, well-caulked, well-timbered, with reasonable guidance it will bear us safely and prosperously through.

"Sit tight! Don't rock the boat! Keep its head well up against the sea! Don't let it get into the trough of the waves! Let every man realize that at this moment calm confidence and calm thankfulness are the first duty. They are absolutely justified by the favorable situation in which we find ourselves. They are the certain guarantee of a continuance of those conditions."

Making the Most of Things

From the best intelligence we have received there is no doubt now but that the small grain crops on the North American continent are as good if not better than the country at large has ever before known and the business world breathes easier in consequence of it, for these crops have got to be moved, and in so doing a large amount of money will be put into circulation, giving new life to business and everything else pertaining to living. People here in the city don't expect to pay any less for what they eat because of the big crops, but if business is good and work plenty the high wages paid for labor will give the wherewith to pay the producer what he asks for his stuff.

An immense amount of building will be started in Chicago this summer, greater than ever before known. Some of the structures will require three years to complete and tens of thousands of men will be given employment on them. 'Tis true, comparatively little lumber will be used in the construction of these larger buildings, although millions of feet will be used in concrete work and scaffolding. But, as a large percentage of the cost goes for labor, lumbermen will get a share of this in the sale of material that will go into the building and repairs of more residences in the city and suburbs. The larger cities are pretty sure of getting a large proportion of the proceeds from the large crops, larger, perhaps, than they ought to for the good of the country districts. But there is no denying the fact that business goes to the city; the town, and the man who goes after it. Therefore, every country town is vitally interested in the problem of keeping at home as much as possible of the money that is produced from the crops raised in its vicinity. It does seem to me that the thinking men of a town should realize this and act upon it more than they do. No doubt but there are individuals in every town who do realize it. Moreover, they realize also their own helplessness in stemming the current against them, for in addition to the forces from without, they have to contend with the indifference of the disorganized elements of their own communities.

This is the position that many intelligent lumbermen are in today. They know that an above the average crop has been raised in their territory and that fair prices are being paid for it in the market. The question with them is, have we the sense and courage to obtain a legitimate share in this created wealth at the point of production, or are we to go on as we have, fighting among ourselves and letting what we are entitled to slip through our fingers by reason of sheer inability to hold it? Is it not a fact that we lumbermen look forward to a promised good crop and count on the good trade we are going to have and then when this materializes, we haven't business sense enough to get the profit we ought to have out of it? When the season is ended we look back and see what fools we have been to let all that money we might have had get away from us. Then we begin to think of the next year and its possibilities for recuperating in making it up. But the next year comes and we do the same thing over again. If we do learn to do better, we learn it mighty slowly. Now here is this mighty crop ahead of you being harvested, stored and marketed.

What Will the Local Merchant Get?

How much are you going to get out of it? How are you going to play the game with the "other fellow" so that both will get fair prices for the business that is done? Will you think more of getting business than making profits? Which shall it be, business with fair profits or business with little or no profits? Individually, of course, we want the business with fair profits, but when there is local competition we are debarred from exercising wholly our own choice. The "other fellow" also wants the same thing. This being the case how is it to be arranged so that this end will be obtained? The child-like simple way is to agree on a fixed price list but this is too raw; besides, it is obsolete and the laws of the state forbid it. It is obsolete because it is unbusiness like and the resort of business men who are too weak to trust each other in a fair, honest competition. Of course, you understand I am alluding to cases where the attempt is made to equalize unequal men and where each is afraid to trust the other without a bond of some kind.

The present tangle in Congress over the anti-trust bills is a good deal owing to the inability to determine what is fair, and unfair competition. The trouble with this in business is that every business man is his own judge and sees only his own side of the case and therefore is naturally inclined to be prejudiced in his own favor. This is why almost invariably we blame the "other fellow" for breaking over the line of fairness. He thinks the same of us, and there we are at "logger heads" over something that one has judged to be fair to himself.

When there are two or more yards in a town owned by opposing interests it is extremely difficult to avoid more or less of acrimony of feeling and misunderstandings. I have been "through the mill" in this respect and know what it is to be working in the dark regarding my competitors. I have lain awake nights studying out schemes to hold my own against them. I have done almost everything but go into a pool, and I never but once agreed on a price list.

After many years of experience of following the usual way of dealing with local competition I at last became convinced that the only logical way of dealing with a competitor was to get on friendly terms with him and maintain this harmony no matter what might come up between us. I confess it was an almighty hard thing for me to do at first and it was several years before I could bend my pride of independence to conform to the harmonizing of our relations. I have swallowed some bitter pills sometimes over it, but I found in time that in governing myself I was better able to govern things that worked for harmony of feeling and action between us. The latter third of my business life in a retail yard was governed on these lines of action, and I can honestly say it is the better way, and the only way to make the most in the long run out of a competitive situation.

You Must Give and Take

In a talk that Captain Hunter gave us at one of our conventions he said this, "to be happy you must give; to be successful you must take. And to be both happy and successful you must give and take." I have never forgotten these words of practical wisdom and I know they have influenced me many times since. I want you too, to learn these words and hang them up on the walls of your memory, for in them lies the gist of the principles you should observe in your relation with a local competitor as well as with everybody else with whom you may have dealing. A give and take policy is not easy to adopt or carry into practice. But nothing that is worth while is easy for it means more or less sacrifice of feeling and freedom. The reflex action, however, fully repays for it all.

This reciprocal policy of dealing has not, of course, much chance to operate in the coming in contact with mail order competition, because of the absence of the personal relations. But if you are in harmonious relations with your local competitor you both can co-operate to meet it more effectively. It is better for business and profits to unite in meeting a common foe, than to be split up and fighting among ourselves and letting the profits slip past both of us. It is better for profits also that a fair division of the trade is had, than for one man to get two-thirds of it and not make any more than he would with only the half.

I remember one time after the yards had got through invoicing I met my competitor and we had a friendly talk. We both felt somewhat chastened in spirit because of the good business there had been that year, yet our profits didn't correspond with it. We got to figuring over it and concluded that through our own foolishness there had been lost what would have been a fair profit for one yard. Getting together as we did at that time was the beginning of a better feeling and understanding between us and from that time on we both sold as much lumber and made a deal more money for our yards. The public, as far as we ever heard was as well satisfied as before. I don't believe, you understand, in gouging the public, for in so doing, it is bound to react in dissatisfaction and antagonism to the yards. But I have yet to know of a community complaining where a dealer is fair, just and reasonable in the margin of profit he takes.

A policy of robbing one man and giving it to another is one that is bound to be found out in time and produce hard feelings and this always results from a "scrapping" condition between the yards. If a man gets a bill figured at one yard and the other dealer cuts it $50 it is very apt to cause that man to think that the first dealer was trying to "hold him up" when the real reason for it was the business antagonism carried to extreme between the two dealers, which in many cases verges on personal enmity. In a case of this kind the dealer who tries to play a hold up game, as the man thought, not only loses the bill, but he also produces a feeling in that party's mind that will keep him away from the yard ever after, and besides, he will tell his friends how he saved $50 on that bill. Now, the same thing may happen to the other dealer and he may lose a bill with a similar saving to the party who buys it at the other yard. He has the same feeling as the other man had, and so it works out that one dealer has almost the same number of enemies as his competitor. So, nothing is gained in this respect and both hold the same empty sack at the end of the year.

Things That Are Overlooked

I think we don't realize as much as we should the increasing cost of carrying on business and the corresponding decrease in the percentage of profit. The business calls for more and more service and with the stimulus of advanced ideas we give it to the public. But we continue to cling to the old idea of getting business at the expense, not of the public, but of our competitor, and ourselves. We indulge, too much, our personal feelings of rivalry with each other instead of exercising our business sense of profit. In the excitement of the game we forget the sense of proportion between volume of business and percentage of profit. We ignore the fact also that we are making

How to Buy Belting

Belting is a vital factor in the sawmill, where loads vary and where economy is measured by service.

Here break-downs more than merely involve Belt expense. They mean loss in production. The plant is idle. Wages have to be paid regardless. So that lost motion, lost time, lost production and lost money added to the original price of the Belt represents actual Belt cost.

There's a big difference then between Belt price and Belt service. One is what you pay, the other is what you get. And Belting bought on a price basis can never be satisfactory, for such Belting is made to sell and not to serve.

Goodyear experts have solved the problem of sawmill Belting. They have designed the exact Belt for the exact purpose—from High Power Main Drive Belts to High Speed Small Pulley Belts for the trimming machine. Let these men help you solve your Belting problems. Remember that Goodyear Belts are made in Canada at the Bowmanville, Ontario, factory and that the same quality standards govern as in the making of Goodyear Automobile Tires that have won world leadership.

"Extra Power"

Men call this the "Master" Belt. It is wonderfully strong, durable, power delivering Belt. It shows the highest friction pull of any Belt we have ever tested. Ten per cent. better than the next best high quality Belt. In it we use our heaviest and strongest duck. All laboratory inspected and tested. The stretch is taken out in the making. The Belt is cured under a heavy hydraulic pressure. Ply separation is impossible. And like all Goodyear Belts, Extra Power has the Goodyear sealed seam.
Made in various widths—"endless" when desired.

GOODYEAR TORONTO
Saw Mill Belting

"Imperial"

Designed especially for high speed and small pulley conditions. Fine Belt for trimmer work.

Use Goodyear Service

Whatever your problems in Belting, Hose, Packing or Valves, let Goodyear experts help you.

These men have solved hundreds of unusual problems in this field and are constantly meeting new ones.

Put yours up to them. Remember that asking questions costs nothing and involves no obligation.

When you buy your equipment this way, you buy from a service standpoint and you know that service is always cheapest. Write today.

each other pay for the indulgence of our rivalry and the public gets the benefit at our expense.

No doubt there will be many managers of line yards read this and they will wonder how they are going to get their share of the business this fall without doing it in the same old competitive way. I know in many cases a line yard manager is "twixt the devil and the deep sea," in the matter of securing a good volume of business and an equally good profit. But he is in competition with another line yard manager who is in the same fix, and over both of them hangs the menace of mail order competition and back of everything in the case is the natural desire on the part of both of them for an increase in salary. Now a manager naturally thinks that his salary ought to be proportioned to the amount of work he does, while, as a matter of fact it is usually based on the amount of profit he produces for the owners of the yard. When a line yard owner looks over the yearly returns from his yards and sees one of them showing a good volume of business but a low percentage of profits, he is not inclined to feel justified in granting a request for a salary increase to the manager of that yard. If, on the other hand, the net profits correspond to the amount of business done he will be more apt to give that manager a raise if he asks for it. So you see, my friend, it is not so much what you do as the results of what you have done that appeals most to the man who has invested his money in the yard.

Now, my boy, if you want your salary raised next January or a better position than you have, remember that it is the amount of profit you are going to get out of this big grain crop, and what will show up in the yard returns at headquarters at the close of the year that will weigh heaviest on the scale for you as a valuable man to have and retain. Just suppose now that you owned a yard and hired a man to run it for you. Would you not figure to pay him a salary according to the net profits of the business he was doing? Suppose he hit you for a raise, and you were paying all the yard could afford under his management, wouldn't you feel like telling him to go ahead and roll up a larger percentage of net profits and then you could afford to and would give him what he asked? This is the way you should look at this question of your remuneration. Men are not employed simply for their benefit, but the employer hires them to make money out of their services. Therefore, the more valuable the services in producing results the greater the justice and ability to pay in increased compensation.

Rewarded According to Results

Two men are in a town each running a yard for different owners each of which keeps track of the business by having daily reports of the yard's business sent to him. These two men have conflicting interests in a business way, as each wants to make a good showing on their daily reports. At the same time, their personal interests are practically identical, one with the other, as each is working on a salary that will be increased or lowered for the same reasons. Now, isn't it a senseless piece of business for these two fellows to be business enemies and thus work against their own personal interests through decreasing their yard's profits, and their own chances for a salary raise? It really looks stupid when you view it from the point of their own financial interests. What glory is it for them to best each other out of bills by cutting the "stuffing" out of them, and thereby lowering their own chances for an advance? Did you ever think of it in this way? When you are boosting your trade by sacrificing profits, you are knocking each other by losing what you are at the bottom working for. Don't think for a moment that this is a mere theory I am giving you. I have been on the inside and talked with a good many line yard owners enough to know something of how they size up their managers in their money-making capacities, and believe me, I am giving you a boiled down summary of their experiences and views on this subject.

Talking with one last winter he said, "we have two or three men who are 'cracker jacks' to get business but somehow they don't seem to know how to make money out of it. They do enough, seemingly, to warrant a better salary than we are paying them, but the earnings of their yards won't warrant it." There are business men in other lines, you and I know them, who always seem to be having a good trade and yet through not having the faculty of making money, they don't have what the volume of their business should give them. Doubtless you would like to know just what you are worth to the yard you are running. Most managers would. Some would be surprised, however, to find out they are not worth as much as they think they are, judging by the amount of hard work they do. Others would like to know to stiffen their backbone in asking for a raise. In a line of yards no doubt some managers are getting less than their yard profits entitle them to, while others are getting more. But in order to keep up the average profit for the whole the good men are made to make up for the deficiencies of the inferior ones.

My opinion is that a manager who is competent to run a yard should also have the ability to know what profits the yard is making or at least approximately so, not particularly for the purpose of asking for a raise but rather that he may use this knowledge to guide him. He should also know the cost of doing business at his yard—and I think this is something that yard owners should tell everyone of their managers—for a man who don't know all this is working in the dark and his competitive disposition is more liable to do business at the expense of profit. With the knowledge to guide him it will act as a brake on his ambition to get ahead of the other fellow by cutting under him. There is too much of this "go it blind" among the managers in the line yard systems and it is not wholly their fault either. Putting two men in a town and telling them to get the business is not enough. They should be instructed how to work for profits and held responsible for securing a certain percentage of profits. But they can't know when they are doing this unless they are acquainted with the boundary line between cost and profit.

When a manager is set down in a town to take charge of a yard he naturally thinks that his greatest problem is to get acquainted with as many people as possible and secure their good will and trade. This, of course, is one of the absolute essentials to his success in getting business. But over in the other yard is really his greatest problem—the manager of that yard—for on the relations formed and established with him largely depends the question of the profitable success of the yard under his management.

I know this is contrary to the usual attitude assumed by young men when they are placed in charge of a yard. The usual way is to ignore the "other fellow" and feel him out and gradually get to know his ways of doing business by the figuring contests between them. They depend also on the tales they hear of him from those of his disgruntled carpenters and other customers who have left him for sundry and various reasons which the new manager only hears the one side of. After a while, perhaps, the two managers meet in person, shake hands, "glad to know you," and all that sort of conversation that doesn't mean anything, but anything pertaining to the business approaching a mutual understanding of future action is studiously avoided.

Now, the first thing for competitors to do should be to get right with each other and be frank and open in discussing the situation and conditions under which both have to work and meet. If they are two managers of line yards it should be understood that good profits for their respective yards mean the probability of better salaries for both, whereas they have nothing to gain of a personal financial interest by the cheap method of cutting prices to get business away from each other. Let the central idea be that of profits, ever remembering that the owners of the yards will use this as the measuring stick of their abilities. All there is in the business of that place for them personally is their salaries and if they can help each other to make good profits they at the same time help each other toward better salaries.

Learned the Lesson

This idea was brought close home to me once by a competitor who had more sense than I had. We were both managers and for some time had been ripping things wide open on our employers' capital. It was one Fourth of July and we were at a picnic. He came over and proposed a walk together out in the woods where the crowd couldn't see us. "Now," said he, "what's the use of us two acting the fool in doing business as we have been doing? We are making no money for our yards, and if we keep on like this the chances are we'll either lose our jobs, or have our salaries reduced, or, at best, continue on our present salaries which are low enough, with our growing families. You want a raise and so do I, but we won't get it at the rate we are going. Why can't we arrange it some way whereby the trade will be divided and bills be sold without any such low cutting as we've been doing?" Much more was said between us in the way of explanations and clearing up points of misunderstanding. He proposed an agreed price list but I refusel because of one previous experience that was not satisfactory nor honorable to both parties. But, we did agree to respect each other's trade in not trying to get away what we knew to be regular customers of each yard, and not to cut below a certain percentage of profit on bills. We knew pretty well each other's yard lists and they were practically the same because there was no difference to speak of in what our stocks cost.

Well, we separated and went to work on the new basis of good feeling and understanding. There was a big crop that year and business was heavy all the fall. When something occurred to make us question the reason, we met and talked it over, and in thus meeting frequently we got to know more of each other in every way. From that time on our own trade came naturally to us without price cutting and the volume of trade was practically the same at each yard as it was before when we were cutting and slashing prices and living at enmity with each other.

Every story has a moral or a sequel and the sequel to our action in this case was that we both received a substantial raise in our salaries the next year and the next year after, too. Ever since then I've

It Bends Without Breaking

A new machine designed especially for bending wagon, carriage and automobile top bows of all sizes and shapes. It is equipped with an adjustable form, galvanized to prevent corrosion of the stock and will bend from 400 to 600 forms per day. The form remains on the machine but the bender strap containing the bent bows is removed after each bending operation. The bender arms and forms are 12-in. wide and will hold strips aggregating that amount.

been obsessed with the idea of profits and have learned to look on "scrapping" conditions as being wholly unnecessary and they can be avoided by injecting common sense into the relations of competitors.

After you have read this all over, read it again and study it over, and if it applies to your case just consider this big crop that is going to be marketed and how much more you will get of it for your yard if you and your competitor get together, throw all your cards on the table, face up, and agree to be decent and pursue a fair "give and take" policy with each other. Put your temper and suspicion under lock and key and throw away the key.

C. H. Ketridge, in the Mississippi Valley Lumberman.

Northern Hemlock and Hardwoods

The Northern Hemlock & Hardwood Manufacturers' Association held its midsummer meeting recently, and reports read at that time show that for the six months ending June 30 there was a decrease in hemlock cut of 4 per cent and a decrease in hemlock shipments of 11 per cent. The hardwood cut showed an increase of 14 per cent. over the corresponding period last year and a decrease in hardwood shipments of 17 per cent., or an increase in total cut of 6 per cent and an increase in total shipments of 13 per cent. The Michigan manufacturers found that it is rather hard to make comparisons of stocks in pile at present with those of a year ago, for last year stocks were away below normal—lower than any other time since 1909—and the demand was above normal. Statistics show that members of the Michigan Hardwood Manufacturers' Association have 65,000,000 feet more on hand at primary points than a year ago. But taking into consideration that nearly 40 per cent. of this excess is in No. 3, the situation is considered most favorable, for this stock is one of the best movers. Wisconsin manufacturers report that in ninety days all of the No. 3 on hand will be practically wiped out by the heavy demand for grain doors. Hemlock stocks are not large and are considered good property, and with the increased demand this fall, now expected, it is figured that hemlock prices will advance to the position they held a year ago. The northern manufacturer, therefore, is in an exceedingly good position to take advantage of the distinct and healthy trade revival that is looked for a little later.

Cooperage Possibilities of Fir

That a very good market for fir staves for making small grape barrels, such as are used in great quantities in Spain, will be opened up to Pacific Coast stave manufacturers on the opening of the Panama canal is the opinion of the United States Consular Agent at Almeria, Spain, who has been investigating the stave possibilities at the request of Pacific Coast manufacturers. Mr. Yost has found that something like 2,000,000 grape barrels are set up each year at Almeria. The staves are 20 inches long, three inches wide and one-quarter inch thick and are packed in bundles of 32 or 33 staves. Many of the staves used in Almeria are manufactured in Western Spain and in Portugal and set up where used. About one-third of the 2,000,000 staves used at Almeria are of oak and shipped largely from the United States. "There is only one lumber dealer of importance in this city," the report adds. "There is little doubt that once the Panama canal is open to traffic, Oregon and Washington lumber will be enabled to compete successfully with the product from the Southern states or with the product from Scandinavia, in the markets of Southern Spain. Practically all the lumber used here is imported from foreign countries."

Timber Industry in Russian Far East

A timber company of Melbourne, Australia, and Siberia, has decided to move part of its plant from Geelong, State of Victoria, Australia, to Imperial Harbor, on the Sea of Japan, Maritime Province. The largest part of the machinery in this plant is of American manufacture. This decision of the company means that sawn material instead of round logs will be shipped to the Australian market. The sawmill will be the largest in the Russian Far East and will bring about considerable development in the soft-wood industry of that region. The Russian Volunteer Fleet is making great efforts to facilitate the shipment of timber from Eastern Siberia to China, India, Australia, New Zealand, South Africa, and European ports by the establishment of a Vladivostok-Baltic Sea line. This company is understood to be carrying out the desire of the Ministry and the fixing of minimum freight rates for timber is encouraged by the Government.

The New York State College of Forestry at Syracuse has estimated that the utilization of the maturing and dead timber on the New York State Forest Reserve of something over 1,600,000 acres should yield a revenue of over $1,000,000 every year and this without impairing the value of the forest for future timber supply and watershed protection.
